Angus Campbell's and Warren Miller's treat-

ment of the motivational factors behind straight- and split-ticket voting is perhaps the best known work on the subject.¹⁴ Their findings indicate that strength of partisan attachments, ballot form, presidential candidate and issue partisanship all affected the level of split-ticket voting in the 1956 presidential election. What is missing, however, is a comparable concern for the specification of the partisan direction of the split-ticket vote for other offices. From that analysis, it is evident that the presence of an extremely popular presidential candidate will induce defections from the opposite party in voting for president. Yet this is only one of several kinds of partisan defection which might occur. The presidential vote often will be a party vote with other factors at the state level producing the defection there. An understanding of the problem of split-ticket voting is equally dependent on the specification of the partisan direction of the split-ticket vote at the state contest level as it is at the presidential level.

What must accompany the restatement of the problem is a change in the form of the dependent variable used by Campbell and Miller. The categories of that dependent variable indicated merely the presence or absence of straight- or split-ticket voting for various national, state, or local contests. Once we ask the question of the partisan direction of the split-ticket vote at other levels of government, it becomes necessary to identify precisely the *offices* for which respondents split their ballots. For example, the Campbell and Miller category, "voted straight except for Senator or Congressman," becomes nearly unmanageable. Since the guiding interest of this project lies in the reconciliation of disparate partisan majorities for state and presidential contests, I shall confine my attention to the network of split-ticket patterns for president, U.S. senator, and governor for which the partisanship of the vote was ascertained.

The explanation of the partisan direction of a split-ticket vote necessarily conjures up a model of opposing forces. The voter's identification with his political party will work against propensities which might lead him to split his ballot at any level. But his evaluation of the presidential candidates may be reinforcing of that predisposition to cast a straight partisan ballot; or, it may increase the tendency to split that ballot when displeasure with the presidential candidate of his own party becomes severe.

In the previous section, the voter's tendency to approve of incumbent officeholders was shown to have a measured effect on partisan voting beyond normal partisan attachments. Thus, it is natural here to conceive of a separate force, which again may reinforce or may oppose normal partisan predispositions. The following hypotheses specify the kinds of patterns anticipated:

Hypothesis 1: When the incumbency status of the senatorial candidate and presidential candidate partisanship support partisan allegiance, the result is a straight-ticket vote for the senatorial and presidential candidates of the voter's own party.

Hypothesis 2: When presidential candidate partisanship supports partisan allegiance but senatorial incumbency status conflicts with both, the level of straight-ticket voting is reduced. The level of split-ticket voting for the presidential candidate of the voter's own party and the senatorial candidate of the opposing party increases.

Hypothesis 3: When senatorial incumbency status supports party identification but presidential candidate partisanship conflicts with both, the level of straight-ticket voting is reduced. The level of split-ticket voting for the senatorial candidate of the voter's own party and the presidential candidate of the opposing party increases.

Hypothesis 4: When the incumbency status of the senatorial candidate and presidential candidate partisanship both conflict with party identification, the tendency to vote a straight ticket against the voter's own party increases.

Hypothesis 5: The level of straight-ticket party voting increases as the strength of party identification increases.

In testing these hypotheses, I have used the combined sample of respondents—1956, 1960, 1964, 1968. Presidential candidate partisanship, of course, involves the assessment of the two presidential candidates.¹⁵ Thus, it is natural to think, not of the level of support or opposition for one candidate, but rather of the net distance between the two candidates based upon the respondent's evaluation of each. Presidential candidate partisanship, then, reflects a net difference between the voter's evaluation of one candidate and his evaluation of the other. The seven-category party identification code was retained since the typical problem of small cell size among leaning partisans was alleviated by use of the pyramided sample.

The dependent variable was constructed by matching straight- and split-ticket voters on

¹⁴ Angus Campbell and Warren E. Miller, "The Motivational Basis for Straight and Split Ticket Voting," *American Political Science Review*, 51 (June 1957) 293-312.

¹⁵ The procedure for constructing these indices of presidential candidate appeal is the same as that for constructing the four indices of partisan attitude, except that the search is made for free-answer content suggesting a reaction to the personal qualities of the candidates.

party identification. The relationships were first examined separately for Democratic and Republican party identifiers in order to be certain that the process was not fundamentally different for either. Then, for the dependent variable, strong Republicans and strong Democrats who, for example, voted a straight ticket for their own party are combined. The four possible combinations are listed in Table 5. The independent variables were recoded on the basis of their supportive or conflicting relationship to party identification.

It is clear from the entries in Table 5 that for those respondents who favorably assessed their own party's presidential candidate and who voted in states where their own party's senatorial candidate held incumbency status, the result is largely a straight-ticket vote. Indeed, only 5 per cent of the strong partisans cast anything other than a straight party ballot. As we move down the table from the completely supportive context to various combinations of conflict and support, straight-ticket voting decreases from the completely supportive context in most cases.

The fundamental question of partisan direction of the split-ticket vote focuses on which category of the dependent variable benefits most from the decrease in the straight-ticket vote. For those respondents who favored their party's presidential candidate but were voting in state contests in which the opposite party's senatorial candidate held incumbency status, the prevailing alternative to the straight-ticket vote is a ballot split for the party presidential

candidate and against the party senatorial candidate. Similarly, when the senatorial incumbent is the candidate of the respondent's own party but the respondent negatively evaluates his party's presidential candidate, the typical choice beyond the straight ticket is the partisan consistent vote for senator and the partisan defective vote for president. Finally, when both presidential candidate partisanship and senatorial candidate incumbency are conflicting with party identification, the alternative to the straight-ticket, party-oriented vote is a straight-ticket vote for the opposing party.

One cannot fail to note, however, the continuing effect of party identification. The insulation from these conflicting forces which partisan attachment provides is clearly demonstrated by the high level of straight-ticket party voting among strong partisans in each of the conflict situations. Also, straight-ticket party voting does decrease as strength of party identification decreases. As a further indication of the accuracy with which these conflict situations predict the split-ticket vote, the percentages recalculated in the two middle categories of Table 5 for split-ticket voters only reveal that fully 100 per cent ($N = 37$) of the strong partisans split their ballots in the predicted direction. While these results are more striking, it seems preferable to retain the straight-ticket voters, since the four-category dependent variable may represent more accurately the range of possible voter alternatives.

Hypotheses 1-4, with appropriate modifications, have been tested for gubernatorial voting

^a Italicized entries are those predicted by Hypotheses 1-5 to contain the largest concentration of respondents.

as well. Since only two elections—1964 and 1968—were available for analysis, the problem of cell size required that we combine strong, weak, and leaning partisans. The entries for senatorial voting were recomputed, eliminating strength of partisanship, for ease of comparison. The results are presented in Table 6 and Table 7. The increases along the diagonal are again clearly evident for gubernatorial voting. In the lower portions of Tables 6 and 7, the matrices were reduced by eliminating the first row and column for each of the two upper displays. Since party identification will naturally provide a good deal of insulation against the tendency to split one's ticket, the success or failure of these predictions can be identified more readily by first eliminating the partisan, completely consistent, straight-ticket voters. We then ask: Given that some kind of defection from party has occurred, how well can that defection pattern be identified? The heavy concentration along the diagonals of these reduced matrices is good evidence of the sources of that defection.

Split-Ticket Voting in Off-year State Elections

When the gubernatorial candidate of one party and the senatorial candidate of the opposite party are both successful in a given state election, we have reason to believe that those successes are tied to their status as incumbents. Just as candidate incumbency status tells us something about the partisan direction of the split-ticket vote in presidential-senatorial and presidential-gubernatorial voting, ballot splitting between different partisan gubernatorial and senatorial candidates in off-year elections should be a function of the supportive or conflicting juxtaposition of party identification and candidate incumbency status. Prior research suggests that ties with party will be stronger in

nonpresidential elections, regardless of which incumbency pattern prevails.¹⁶

Both hypotheses find support from the evidence in Table 8. The data in that table are drawn from a pyramiding of the off-year election samples, 1966 and 1970, and a pyramiding of the 1964 and 1968 presidential year samples. The concentration of respondents in the first column of each table depicts the strong ties with party in spite of the various conflicting incumbency patterns which might be brought into play. Across these different supportive and conflicting election contexts, the level of straight-ticket party voting for gubernatorial and senatorial candidates is consistently greater in the off-year elections than in the presidential election years.

Also, the concentration of the second largest percentages along the diagonals of the tables indicates that conflicting incumbency patterns do give partisan direction to gubernatorial-senatorial split-ticket voting in both off-year and presidential elections. The exception, however, is found in the final row of the table, which contains respondents for whom both gubernatorial and senatorial incumbency conflict with party identification. Apparently the nuances of the split-ticket vote for senator and governor in this completely conflicting context are a good deal more subtle than can be identified here.

The specification of the incumbency context of state elections has been useful in delineating the partisan direction of the split-ticket vote in state and national elections. If we treat incumbency theoretically as a contextual factor, then we have, in effect, perfect measurement of the concept. A more satisfying theoretical treatment, however, would view the actual effect of this contextual phenomenon on split-ticket voting as a result of several distinct components of

individual reaction—candidate familiarity, approval of the status quo, and so forth. Other measurements, presently unavailable, would have allowed for a sorting out of these various components of the incumbency advantage. In one sense, however, the results are even more striking in light of the imperfection of the measure. We are able to specify with some success the partisan direction of various split-ticket voting patterns in the states without the slightest hint of individual voter response to the qualities of those candidates.

Decomposition of the Split-Ticket Vote for President and U.S. Senator

Although substantial effects of candidate partisanship and incumbency have been observed, the conflicting context which gives rise to the split-ticket vote might not be very widespread. It is necessary to consider the relative concentration of split-ticket voters in each of the supportive and conflicting situations—i.e., for turning the problem around and computing column proportions. Without this kind of reverse

formulation, substantial effects of an independent variable might be observed when a given set of events occurred; yet the frequency of occurrence may have been small, leaving a rather high level of split-ticket voting unaccounted for. This kind of reverse decomposition will have obvious implications for the observed pattern.

After isolating only split-ticket voters, decomposing that split-ticket vote means forming nine categories by taking every possible combination of senatorial incumbency and presidential candidate partisanship. The coding of a respondent as consistent, neutral, or inconsistent on presidential candidate appeal and on senatorial incumbency status is governed by whether his vote for each of those two offices was (1) consistent with the partisan direction of the motivation, (2) unaffected since the motivation was neutral, (3) inconsistent with the partisan direction of the motivation.

In the first category found in Figure 3, both entries are "consistent." This means that the respondent split his ballot in such a way that (1)

supports	supports	74%	7%	12%	5%	(82)
supports	conflicts	63	33	0	5	(40)
conflicts	supports	69	5	17	9	(42)
conflicts	conflicts	65	16	7	12	(99)
Presidential Elections (Pyramided Sample: 1964, 1968)						
supports	supports	69%	17%	11%	4%	(54)
supports	conflicts	59	32	4	6	(111)
conflicts	supports	57	6	26	12	(51)
conflicts	conflicts	87	4	4	4	(23)

in voting for president, he voted for the party whose presidential candidate he favored; and (2) in voting for senator, he voted for the other party's senatorial candidate, who happened to be the incumbent. Thus, his split-ticket vote is consistent by both criteria in the sense that he split the ballot in the partisan direction predicted. If the conflict situations identified can account for a substantial portion of the split-ticket vote, then the heaviest concentration of respondents should be found in the first category, with the remaining eight categories quite sparsely represented.

Figure 3 displays the decomposition graphically. Regardless of strength of partisan attachments, the split-ticket vote falls substantially into the first category. Thus, of the nine possible cells through which the split-ticket vote might be dispersed, the one category which simply sets senatorial incumbency status and presidential candidate appeal in conflict contains nearly half of that split-ticket voting. Actually, the second and third categories are not disconfirming of the hypothesis since, in each

of those, one of the two independent variables (presidential candidate appeal or senatorial incumbency status) favors neither party, while the other remains consistent with the predictions. Note, however, that the fourth category which contains split-ticket voters inconsistent on senatorial incumbency status, is somewhat large—a probable result of the inability to specify even to the slightest degree these respondents' reactions to the personal qualities of the candidates for senatorial office.

The implications for divergent aggregate patterns are evident. The relatively common occurrence of state electoral divisions of partisan majorities between different partisan candidates—presidential, gubernatorial, or senatorial—finds its individual level counterpart in split-ticket voting. When presidential candidate partisanship conflicts with basic party attachments, defections from party are induced in presidential voting. Similarly, the common tendency to approve of incumbent candidates brings about a higher level of partisan defection in statewide voting. The decomposition indicates that about

half of the ballot splitting in contests for the presidency and U.S. Senate seats follows just this kind of pattern.

Summary and Conclusions: Implications for Normative and Empirical Theories of Voting

That voters tend to approve of an incumbent officeholder, often in contrast to negative evaluation of the incumbent's party, has some implications for normative theories of voting. Philosophical treatises of the first half of the nineteenth century place an unparalleled stress upon the wisdom of the populace in the form of Jacksonian democratic theory. Yet all propositions of a given normative theory are never

internally consistent with one another on all counts. Barriers to succession for statewide office is a case which highlights that inconsistency. The Jacksonians sought to democratize the governing process thoroughly by maximizing the number of different individual citizens actually participating in that process. A certain inconsistency resulted, however, from the standpoint of the individual voter. If voters in democratic political systems are presumed to have the necessary knowledge and judgment to arrive at informed decisions, then the presence or absence of an incumbent officeholder on the ballot ought not to sway that decision in the slightest. In effect, the range of alternatives be-

Decomposition of the split-ticket vote for president and U.S. senator showing per cent of all split-ticket voters who split ballot in ways either consistent, neutral, or inconsistent with presidential candidate partisanship and senatorial incumbency pattern, by strength of party identification (Pyramided sample)

Figure 3

comes restricted, with the implication that electoral decisions will not be based upon the soundest of judgments when incumbent officeholders are allowed to seek re-election. The restrictions on gubernatorial succession, persisting in some states from the 1820s to the 1970s, imply just such a reservation about the qualifications of individual voters.

To the extent that the motivation behind restrictive succession laws was the suspicion that voters would be more inclined to vote simply on the basis of incumbency, it was not unrealistic. Neither is it a particularly happy conclusion for normative theorists. Findings of an earlier decade concerning party identification and voting brought about a revolt of the normativists who complained that the prevalence of straight party voting in a vacuum of issue awareness was not the occasion for relaxing the standards of normative democratic principles.¹⁷

Party voting, however, is not necessarily inconsistent with the image of the informed voter, prevalent in classical normative theory. Most of our respondents do give at least one response about the two parties suggesting that they associate various good and bad conditions with the presence of those parties in government. While identification with party does not mean that the voter has much of a grasp of specific party policies, it does typically reflect more than blind identification with a party name. In this sense, widespread party voting need not be abhorrent to normative theorists.

The prevalence of incumbency effects cannot be so easily reconciled with tenets of normative voting theory. One might assert that just as party identification is a useful, shorthand device for making decisions in the absence of considerable information, so too is the predisposition to vote for the incumbent officeholder as long as the voter is moderately satisfied with things as they are. Yet these findings do not suggest exactly that. Recall that even for respondents located at the most anti-Democratic point on the scales of partisan attitude, the level of Democratic voting is much higher for Democratic incumbents than for Democratic challengers. Therefore, even the most excessive displeasure with the politics and governing of one party can be overcome partially when that party's candidate happens to be the incumbent officeholder. Candidate incumbency status is

certainly a shorthand guide to political decisions, but its widespread impact upon voting in state elections runs counter to the tenets of classical democratic theory.

The implications for empirical theories of voting are best set out in the context of the seeming paradox in American federalist politics which served as the starting point of this analysis: Basic party loyalties have been shown to have pervasive effects in the arena of national presidential politics; yet election campaigns in the American states often culminate in partisan electoral decisions which are quite inconsistent with the presidential election results in those respective states. Does this mean that party loyalty gives way on a large scale to issues peculiar to each state as a guide to subnational electoral choice? The evidence presented in this paper suggests that the answer is no. The widespread occurrence of aggregate partisan disparities in state election results does not imply necessarily a fundamentally different decision-making process for the individual. The predisposition to vote for one party by virtue of the voter's identification with that party pervades decision making in contests for state governorships and U.S. Senate seats. In addition, the assessments of party, which are less stable over time, contribute measurably to the successes and failures of senatorial and gubernatorial candidates from election to election, as is the case for presidential voting.

The observation concerning disparate partisan majorities for different office contests is not without merit, however. Certainly some contextual factor operating in different partisan directions in different states is a likely source of divergent aggregate patterns between state and national contests. One such factor has been identified as the candidate incumbency pattern prevailing in each state. When the partisanship of the incumbent candidate for governor or U.S. senator runs counter to the partisanship of the individual voter, defection from party is more likely to occur.

I have attempted to specify the partisan direction which the split-ticket presidential-senatorial or presidential-gubernatorial vote would take by examining the conflicting or supportive relationship of two motivations—presidential candidate partisanship and the tendency to approve of incumbent officeholders—to party identification. The spot-welding effect of a completely consistent relationship among these three phenomena is clear in the high level of straight-ticket, party voting. As either is brought into conflict with party identification, however, split-ticket voting increases in the cat-

¹⁷ The arguments against the modification of normative theory on the basis of empirical findings are made by several writers in *Apollitical Politics: A Critique of Behavioralism*, ed. Charles A. McCoy and John Playford (New York: Thomas Y. Crowell Company, 1967), especially pp. 185-219.

egory anticipated. Also, nearly half of the total number of split-ticket voters are found to be concentrated in the one conflicting category in which the partisan directions of the split-ticket vote are consistent with the equivalent partisan directions of presidential candidate appeal and senatorial incumbency status.

While examinations of aggregate election results might have suggested that contemporary theories of voting behavior in presidential elections reveal little about decision making for voters in state elections, the testing of some of those theoretical propositions at the individual level does not bear out that view of state elections. However, the modification of those propositions by the introduction of one important concept—candidate incumbency status—is clearly in order for state electoral contests. The treatment of that phenomenon as a systematic force operating on voters in state elections both improves the applicability of those theoretical propositions and resolves to some extent the apparent disparities between election results in the states and prior theoretical expectations about individual voter behavior.

Appendix

In the survey studies of voting behavior over the past two decades, the Survey Research Center interview schedules have sought repeatedly the respondents' evaluations of the Republican and Democratic parties through free-answer questions:

I'd like to ask you what you think are the good and bad points about the two parties. Is there anything in particular that you like about the Democratic (Republican) party?

Is there anything in particular that you don't like about the Democratic (Republican) party?

Now I'd like to ask you about the good and bad points of the two candidates for President. Is there anything in particular about (Democratic presidential candidate) (Republican presidential candidate) that might make you want to vote for him?

Is there anything in particular about (Democratic presidential candidate) (Republican presidential candidate) that might make you want to vote against him?

That much of the richness in these responses has remained through the coding process is evidenced by nearly one thousand possible code categories to which a single response might be assigned. As many as five separate responses are coded. The utility of these indices of parti-

san attitude has been evident in reports on several occasions.

The first step in the construction of the indices is to extract responses on the basis of content and positive or negative evaluation: (1) response reflecting the respondent's favorable attitude toward the Democratic party as it relates to various population groups; (2) response suggesting a positive reaction to Democratic domestic policies; (3) responses suggesting a positive reaction to Democratic foreign policies; and (4) response indicating a positive assessment of the Democratic party's performance as managers of government. For each respondent, the total number of positive responses to the Democratic party is obtained within each of the four subject matter areas. Comparable summed quantities are formed for negative reactions to the Democratic party, positive reactions to the Republican party, and negative reactions to the Republican party. The positive evaluations of the Democratic party and the negative evaluations of the Republican party are then summed, yielding a scale on which high values indicate a strongly pro-Democratic, anti-Republican attitude. A similar computation is performed on the pro-Republican, anti-Democratic responses, yielding a scale on which high values suggest a strong, pro-Republican, anti-Democratic attitude. The final step is simply the subtraction of the latter from the former, the result being a scale for which high values indicate a net favorable Democratic attitude for each of the four content areas. The computations are performed separately for each of the four dimensions of partisan attitude:

w_{ij} = pro-Democratic response for j^{th} response of individual i

x_{ij} = pro-Republican response for j^{th} response of individual i

y_{ij} = anti-Democratic response for j^{th} response of individual i

z_{ij} = anti-Republican response for j^{th} response of individual i

v_i = index of partisan attitude for individual i

$$v_i = (\sum_{j=1}^4 w_{ij} + \sum_{j=1}^4 z_{ij}) - (\sum_{j=1}^4 x_{ij} + \sum_{j=1}^4 y_{ij}),$$

where initial 0,1 scoring indicates presence or absence of response.

These indices have been constructed according to the criteria used by Stokes.¹⁸ A specification of which open-ended responses are coded into each partisan attitude would require too much space for presentation here.

The Impact of Party on Voting Behavior in a Nonpartisan Legislature*

SUSAN WELCH

University of Nebraska

ERIC H. CARLSON

University of Oregon

In partisan legislatures, party has been found to be the most important variable influencing the behavior of legislators.¹ This paper will examine a nonpartisan legislature to attempt to determine the relative impact of party and constituency as reference groups in cuing legislative behavior where the influence of party is institutionally minimized.

Earlier studies, all done in partisan legislatures, have produced a variety of hypotheses concerning the impact of party, constituency, and other reference groups on the voting behavior of the legislator. Here, we will be concerned with those hypotheses that relate to party and constituency.

Hypothesis 1: Party is the most important variable influencing legislative voting behavior. This finding has been consistent whether the analyst has used party majority votes, cluster bloc techniques, scaling techniques, or factor analysis to examine this behavior.² For legislators, party serves as the most important reference group in organizing their behavior, and less explicitly, as the chief device in producing

relatively structured voting situations in the entire legislature much of the time.

1a: The importance of party is due to the independent effect of party leadership and party organization within the legislative body.³ Thus, those who have found this relationship indicate that party is a manifest cue for legislative behavior. Party leaders have rewards and punishments to offer, and, especially in state legislatures, this provides a powerful incentive to go along.

1b: Party serves in a more indirect way to cue voting behavior. Legislative votes are party votes not so much because of party leaders and organizational discipline, but because party is a catch-all for sets of beliefs and attitudes, and these attitudes differentiate Democrats and Republicans. Or, even more indirectly, party influences voting behavior on a psychological level, so that self-identification as a Democrat or Republican produces distinct voting patterns, once a "Democrat" or "Republican" "right" vote is cued by some party leader or cohort.⁴

1c: Party is an important variable in explaining voting behavior because it reflects differing constituency interests. LeBlanc found in an investigation of 26 state senates that senators were more loyal to their parties in those states where constituency differences between the parties were greatest. Where parties did not have differing constituency bases, party voting was

* Support for this project was provided by the Research Council of the University of Nebraska. The author wishes to express thanks to University of Nebraska colleagues Peter Shocket, Philip Dyer, Michael Steinman, and Robert Sittig for their helpful suggestions concerning this paper, and to David Capek and James Bowman for their assistance in data collection. A special thanks to Eric H. Carlson for stimulating my interest in this approach to legislative politics and for suggesting some of the patterns of analysis used here. An earlier version of this paper was presented at the Annual Meeting of the Midwest Political Science Association, Chicago, Illinois, April, 1972.

⁴ For a review of ideological and policy differences between party leaders and followers, see Herbert McClosky, "Issue Conflict and Consensus among Party Leaders and Followers," *American Political Science Review*, 54 (June, 1960), 406-27; Angus Campbell, Philip E. Converse, Warren E. Miller, and Donald Stokes, *The American Voter* (New York: John Wiley & Sons, 1960) is a standard source on the importance of party identification on voting behavior. For a review of the influences on legislative voting see Malcolm Jewell and Samuel Patterson, *The Legislative Process in the United States* (New York: Random House, 1966), especially pp. 430-431.

less frequent.⁵ Shannon, at one point, argues that the differing constituency bases of the two congressional parties would seem to account for many of their differences,⁶ and Flinn notes that constituency is the basis of party cohesion.⁷

Hypothesis 2: Constituency is related to legislative behavior, independent of its relationship to party. Froman found that among members of each party those from districts that were socioeconomically "liberal" voted more "liberally" than those from "conservative" districts.⁸ McRae found that Republicans from low-income districts and Democrats from high-income districts tend to vote less often with their party majority in the legislature than do legislators from "typical" party districts.⁹

Hypothesis 3: Party voting, even within legislatures where it is common, varies from issue area to issue area, as does constituency-related voting. Some issues, such as elections and reapportionment, find high degrees of party voting in most legislatures, other issues such as civil rights find little party voting in most. Issues such as local government and apportionment are highly related to constituency characteristics in many legislatures, other issues such as business regulation are not.¹⁰

Wiggins, "Party Politics in the Iowa Legislature," *Midwest Journal of Political Science*, 11 (February, 1967), 86-97. Warren Miller and Donald Stokes found great differences among broad issue areas in the correspondence between constituency opinion and voting of congressmen. See, "Constituency Influence in Congress," *American Political Science Review*, 57 (March, 1963), 45-56.

In the nonpartisan setting, it was assumed that party would not be as important a factor in influencing voting behavior as in the partisan setting. The first question to be examined is the extent to which party influences voting behavior. If party is not influential, the second question, in light of the hypotheses, is whether any other factors, especially constituency, will assume the function that party performs in a partisan legislature. Will constituency groups serve as references for legislative voting behavior? Will any other factor or set of factors replace the influence of party in structuring legislative behavior? These questions relate then, both to individual behavior and the structure of voting as a whole.

Using a nonpartisan legislature to test some assumptions about voting in a partisan legislature is not as perverse as it may seem. We may view such an analysis of a nonpartisan legislature as a sort of control for investigations of partisan legislative behavior. It offers a unique way to test the above hypotheses, since the removal of the influence of party should have different effects on voting behavior in the legislature depending upon what is most important, i.e., whether it is the leadership and organization of party (hypothesis 1a), and psychological or ideological functions of party (hypothesis 1b), party as a reflection of constituency (hypothesis 1c), or constituency itself (hypothesis 2). If it is the first of these variables, then minimizing party influence should have an extreme effect on voting. One would expect voting that is highly disorganized in terms of stable coalitions and random in terms of issue positions, with legislators looking for cues in all sorts of different places.¹¹ If hypothesis 1b, 1c, or 2 is correct, then we might expect the nonpartisan voting patterns to be both structured and explainable, either by party or constituency factors.

On a secondary level, we will determine whether different issues are characterized by different patterns of voting behavior, as suggested by hypothesis 3, or whether voting in a nonpartisan legislature will be so different on the group level that all issue areas in a nonpartisan setting are characterized by similar voting patterns.

The Setting

The nonpartisan body that will be examined is the Nebraska unicameral, one of two nonpartisan state legislatures. While in the Minnesota nonpartisan legislature there appears to be

¹¹ Patterson, "Voting Behavior in a One Party State Legislature."

some association between Liberal and Conservative caucuses and the state party structure,¹² in the Nebraska legislature few traces of party organization are evident. This has been the conclusion of past investigators of the legislature, and despite increasing pressure from the party organizations to revert to a partisan system, still seems to be true.¹³ The perception of the lack of partisan conflict is also held by the legislators themselves. When asked to characterize types of conflict in the legislature, only two said that party conflict was important. This number, about 4 per cent of the membership, can be contrasted with the responses obtained by Wahlke et al. in New Jersey (85 per cent responded that party conflict was important), Ohio (59 per cent), California (26 per cent) and even Tennessee (17 per cent).¹⁴ Thus, even though all the legislators will admit to a party preference¹⁵ and many have held party offices, this partisanship is not perceived to carry to the floor of the legislature.

Methodology

The data analysis in this paper utilizes Guttman-scaling and regression techniques. Every

¹³One observer writes that "neither seniority, partisanship, nor gubernatorial influence are of major significance in the power struggle in Nebraska's unicameral structure" (Richard Marvel, "Decision Making in the Nebraska Unicameral Legislature," [Ph.D. thesis, Department of Political Science, University of Nebraska, 1966] pp. 76-77). Interviews with high state party officials and associates of the governor confirm the impotence of these forces in dealing with what one former governor called "an army of all generals." Power within the chamber is diffuse; as the unicameral legislature is now organized, the Speaker is elected by the full membership on a secret ballot. Some disagreement exists as to the degree of power held by the Speaker; in the past it tended to be an honorific post, but is now becoming a more important position. See Robert Sittig, "Unicameralism in Nebraska, 1936-1966," *State Government* (Winter, 1967), 38-41, and Marvel, Chapter 4. Membership on the Committee on Committees is another potential source of power; the Chairman of this committee is elected by the full house, but the other members are chosen by caucuses of members from different regions of the state. Committee chairmanships are not awarded on the basis of seniority necessarily, and the normal term of office for chairmen is two terms. For an overview of the Nebraska political system see Bernard Kolasa, "The Nebraska Political System: A Study in Apartisan Politics" (Ph.D. thesis, Department of Political Science, University of Nebraska, 1968).

¹⁴John Wahlke, Heinz Eulau, William Buchanan, and Leroy Ferguson, *The Legislative System* (New York: John Wiley and Sons, 1962), p. 425.

¹⁵Interviews with legislators indicate that all are quite willing to identify themselves with one of the two major parties. These interviews are from an unpublished survey conducted by Eric H. Carlson.

roll call in each of five sessions of the Nebraska legislature (1927, 1937, 1947, 1959, 1969) with at least 10 per cent dissent was examined.¹⁶ The number of usable roll calls in each session varied from 131 in 1937 to 282 in 1969 (see Table 1). The 1927 session was a partisan session; it was examined in order to give some indication of whether the findings for the nonpartisan legislature were unique, or whether they reflected a long-standing political style in Nebraska. Longitudinal study of the 35 years since the establishment of the nonpartisan was undertaken so as to detect the development, if such exists, of some factor around which behavior in the legislature is organized.

The method used to convert the several hundred roll calls to a usable number of dimensions was Guttman scaling.¹⁷ Some researchers divide bills a priori into sets that are seemingly scalable because of similar manifest content—tax bills, civil rights bills, local government bills, or whatever.¹⁸ Guttman scaling, however, can provide a means to combine data in a way not dependent on the researcher's arbitrary classification of the issues. The use of the Q-matrix gives the investigator a method to compare all roll calls with all other roll calls in order to ascertain whether these roll calls will scale.¹⁹ Thus, it is the *legislator's* issue dimensions, not the *researcher's* predetermined ones, that are measured. Taxation bills may scale with education, civil liberties with business reg-

¹⁶The selection of years was not as random as it may seem. Originally the design called for the use of ten-year intervals, beginning with 1927 and continuing until 1967. Altering the selection to the years listed, however, had the advantage of allowing an examination of two nonpartisan sessions with Republicans serving as governor, two with Democrats. While this distribution was later found to have no apparent effect, at the time the data were collected, it seemed reasonable to assume that legislative behavior might be different during the tenure of governors from the majority party of the state.

¹⁷For an explanation of Guttman scaling and its uses in legislative analysis see McRae, *Issues and Parties*; George Belknap, "A Method for Analyzing Legislative Behavior," *Midwest Journal of Political Science*, 2 (1958), 377-412; Charles D. Farris, "A Scale Analysis of Ideological Factors in Congressional Voting," *Journal of Politics*, 20 (May, 1958), 308-38; Aage Clausen and Richard Cheney, "A Comparative Analysis of Senate-House Voting on Economic and Welfare Policy, 1953-1964," *American Political Science Review*, 64 (March, 1970), 138-52.

Table 1. Some Attributes of Voting in each Session*

	1927 Partisan	1937	1947	1959	1969
		----- Nonpartisan -----			
Total <i>N</i> of bills with more than 10% dissent	217	131	145	172	282
<i>N</i> of bills scaling	100	64	63	61	75
Percentage of bills scaling	47%	48%	43%	35%	27%
<i>N</i> of scales	16	9	9	9	12
Average <i>N</i> of bills per scale	6.5†	7.6	7.9	7.6	7.3
Range in <i>N</i> of bills per scale	4-11	5-14	4-21	5-17	6-11

* There were 43 senators in 1937, 1947, and 1959, 49 in 1969, and 33 in the 1927 Senate.

† Some bills appear in more than one scale, thus, this figure does not necessarily equal $\frac{N \text{ of bills}}{N \text{ of scales}}$.

ulation, and so on in combinations that would not be predicted a priori by the investigator.

An obvious problem of this analysis is that conceivably, given the number of roll calls being analyzed, some bills will scale together simply by chance.²⁰ In this analysis, 59 empirical scales with a minimum of four bills each were found in the five sessions. Each of the scales had a minimum CR of .92. All but four of these scales had a reasonably consistent content, not necessarily completely homogeneous, but related in some way. These four scales of four and five roll calls each were removed from the analysis on the assumption that they were chance collections of bills.²¹ The remaining 55 scales each had a CR of .94 or better, and no roll call in each had more than 15 per cent error. For the purposes of further analysis, one additional scale in the 1959 session was deleted because it essentially duplicated another scale. The remaining 54 scales, then, form the basis of the following discussion. The issue areas of

the scales in each year are described in the Appendix.²²

These scales delineate the issue areas in each session. To determine patterns of voting behavior within each issue area a further procedure was used. Each legislator received a scale score for each scale. Each of these sets of scores (54 in all) served as the dependent variable in a stepwise regression equation, with various constituency, personal, and party characteristics as independent variables. These characteristics are: party identification of the senator, his age, and his education; the proportion of his district that is urban; a measure of the industrialization of his district; and the partisan preference of his district as expressed in its vote for president in the election prior to the legislative session analyzed (1924, 1936, 1944, 1956, 1968).²³

²² Since the scales were built from the universe of roll calls and not from predetermined "issue" areas, the content of the scales is not always as precise as one might expect or wish. Thus it was found that education and local government issues are often mixed together in one scale, regulation and taxation issues seem to scale together frequently, as do taxation and appropriation bills in some cases. In the following discussion the scales will be labeled by their primary substantive content.

²⁰ McRae recognizes this problem and comments that "empiricism cannot be unbounded . . . otherwise it might lead to such absurdities as the selection of an arbitrary group of legislators simply to eliminate 'error' votes or the assemblage of a meaningless collection of roll calls for which the legislators in question had scalable votes" (McRae, "Identifying Issues and Factions," pp. 911-12). Roll calls with lopsided distributions of votes are particularly likely to scale randomly. For example, a vote with only 10 per cent dissent, even if all the dissents are "errors," would still empirically scale with any other set of votes if 10 per cent error is the only criterion for inclusion in the scale.

²¹ Some arbitrariness probably entered into the decision to exclude the four scales. They had three characteristics which led to the decision: slightly lower CR's than the other scales, lopsided vote distribution in most roll calls comprising the scales, and roll calls unrelated to each other. These scales were removed from the analysis because it was assumed that they were not measuring purposive behavior, only statistical artifact.

²³ Other district and personal characteristics were used in preliminary analyses. These included such variables as the size of the legislator's hometown and his occupation, the income level and racial composition of senatorial districts, and the gubernatorial vote in the senatorial districts. The six variables chosen for this analysis were chosen because, on the whole, they explained the most variance in scale scores and minimized the problem of multicollinearity. Surprisingly, the gubernatorial preference of senatorial districts was even less related to the senator's party identification than was presidential vote. The statistics used in the analysis are taken from *The Fifteenth Census of the United States*, vol. 3, pt. 2, *Population* (Washington: U.S. Census Department, 1933); *County and City Data Book* (Washington: U.S. Census Department, 1956, 1962, 1967); *Nebraska Blue Book* (Lincoln, Nebraska: Nebraska Legislative Council, 1928, 1938,

Stepwise regression finds the variable with the strongest zero-order correlation with the dependent variable, then holds this variable constant while finding the variable with the highest first-order correlation, etc. Thus, it gives us a powerful and parsimonious means to examine the relative impact of a number of independent variables on a dependent variable.²⁴ In the past, researchers have been somewhat unwilling to use this kind of multivariate technique to analyze roll-call behavior. But in the case where the aim is description of a population, rather than inference from a sample to a population, the stringent limitations on the use of these techniques need not be met.²⁵ Zavoina and McKelvey have discovered some problems in using ordinal Guttman scales as a dependent variable in a regression model, but suggest that this procedure is conservative from a hypothesis-testing standpoint.²⁶ Jackson has successfully used multiple regression techniques to predict senatorial voting in the U.S. Senate.²⁷ Regression analysis, then, appears to be the most useful and practical tool to deal with the particular problems in examining multiple causation in legislative voting.

The methodology of the paper thus provides for two steps: first to construct from roll calls in each session Guttman scales that comprise the totality of all scalable bills meaningful in terms of issue content; and second, to attempt to explain voting on these scales in terms of the independent variables of constituency, party, and two personal characteristics.

Structure in Roll-Call Voting

One might hypothetically construct two polar kinds of roll-call behavior on the part of legislatures as wholes. On the one hand, all votes taken in the legislature could fall along a single dimension, and hence would form one scale. This sort of situation occurs where par-

ties are tightly disciplined and the party leadership enforces this discipline on every vote. Voting in this dimension would be entirely explainable by party alone. Conceivably, however, one might find this comprehensive unidimensionality explainable by some other factor than party—if all votes were urban-rural votes, for example. This situation we might term a completely structured pattern of voting.²⁸

At the opposite end of this scheme would be the situation in which *no* set of four or more votes scaled. This would indicate that no group of four or more votes formed a single dimension; almost every vote would have unique coalitions of legislators on each side. This situation presumes almost no party regularity at all, nor any regularity that might be defined by constituency, or interest group influence, or any other sort of regional, or personal, or informal pressures. This type of voting might be termed "random," or "unstructured."

Probably no state legislature or house of Congress would fall at either extreme consistently, although Carlson found that the New Jersey Senate approached the former pattern in at least one session.²⁹ In the Nebraska Senate, as Table 1 indicates, the proportion of scalable bills decreased over the time period examined, from almost one-half in 1927 and 1937 to slightly more than one-fourth in 1969. Thus, in 1969, almost three-quarters of non-unanimous votes displayed no consistent relationship in voting patterns to even three other votes. The smallness of this proportion of scalable bills indicates a good deal of apparent randomness in voting behavior on the part of the legislators, since consistency of voting, whether cued by party, constituency influence, interest-group pressure, committee structure or whatever, would be indicated in clusters of bills. This seeming randomness has been commented upon by Rall, who notes that the nonpartisan legislature has "... a tendency to fragment into small blocs, some of which contain only a single member."³⁰

This pattern may be compared with that observed in other legislative bodies. Farris asserted that for the U.S. House, "... Representatives maintain enough consistency in voting behavior ... so that practically all their roll call votes can be classified as part of one scale

1948, 1958, 1966, 1968); *Census of the the Population, 1950*, 2 (Washington: U.S. Government Printing Office, 1952), pt. 27, *Nebraska*; Richard Scammon, *America at the Polls* (Pittsburgh: University of Pittsburgh Press, 1965).

or another."³¹ Jackson's analysis of the 1961 and 1962 sessions of the U.S. Senate seem to indicate that more than 65 per cent of the bills scaled.³² Carlson, in his analysis of nine houses of five legislatures (New Jersey, Michigan, Ohio, Tennessee, and California) found that the percentage of bills scaling ranged from 100 per cent in the highly partisan New Jersey Senate to 29 per cent in the California House; only three houses had less than 40 per cent scalable bills (both California houses and the Tennessee House). Patterson found in the one party Oklahoma House that about one-half the votes there were scalable (62 of 127) and that another 17 per cent formed what he called "quasi-scales."³³

Comparing results from the Nebraska Senate to results from these other analyses, one notes that voting in the most recent sessions of the Nebraska unicameral (and these sessions are more directly comparable in terms of time) is more unstructured, in terms of scalability of roll calls, than it is in any other legislative body. This is true even in comparison with the one-party Oklahoma legislature. California provides a close rival to Nebraska's looseness of structure. The California legislature in the late 'fifties (when the analysis was done) represented a very weak partisan legislative system. The 1927 and 1937 sessions of the Nebraska Senate, on the other hand, conform more closely in degree of structure to some other legislative systems. The 1927 system was partisan, and while the 1937 system was nonpartisan, about 80 per cent of its members had served in the partisan legislature of 1935 or earlier.³⁴ One might hypothesize, then, that some behavior patterns from the partisan era lingered on among these members.³⁵ At any rate, while it is somewhat dangerous to generalize from five data points, there does seem to be a trend to-

ward decreasing structure in legislative behavior since the establishment of the nonpartisan system in Nebraska. This trend provides some evidence for the hypothesis that it is the organization and discipline of party leadership, over a series of votes that provide voting cues for legislators' overall voting patterns. It appears that, in Nebraska at least, no other cue or reference group was as salient for legislators. Thus, in the most recent session, without party organization and leadership, most votes are unrelated to other votes.

Explaining Voting Behavior

The preceding section has described the lack of structure in voting behavior in the Nebraska unicameral legislature. This section will deal with the scalar analysis of that part of the voting behavior that was structured. It has been observed that, in general, neither party nor constituency nor any other system of reference groups has been able to serve as a cue consistently enough to present a structured voting situation. In those voting situations that *are* structured, however, what are the relative influences of party and constituency?

Consider several assumptions reflecting the applicability of the original hypotheses to the nonpartisan legislature:

(1a.) We will assume that if neither party nor constituency is related to voting (r^2 and R^2 will be used as measures of this relatedness), then this fact constitutes evidence in favor of hypothesis 1a: the importance of party is due to the independent effect of party leadership and party organization within the legislative body. That is, in the nonpartisan legislature, neither party identification nor constituency influence have been removed, but party leadership and organization have been. If the hypothesis is true, then, we would expect party to explain a small amount of the variance observed, i.e., have a small r^2 .

(1b.) If party is strongly related to voting and unrelated to constituency, then this would provide evidence for the strength of hypothesis 1b: Party is an important cue because of psychological or ideological identification, not because of leadership and discipline, or because of its reflection of constituency characteristics.

(1c.) A finding that party identification is strongly related to voting and to constituency would provide some support for hypothesis 1c: Party is an important variable in explaining voting behavior because it reflects differing constituency interests. If this condition holds, however, it would not logically rule out either hypothesis 1b or 2.

(2.) If constituency is strongly related to

³¹ Farris, "Scale Analysis," p. 314.

³² Jackson, "Statistical Models of Senate Voting," p. 458.

³³ Carlson, "Five State Legislatures," Table 3; Patterson, "Voting Behavior in a One Party State Legislature."

³⁴ This lack of turnover may be explained by noting that the new nonpartisan legislature had 43 members, while the two houses of the 1935 partisan legislature had over 100 members.

³⁵ It might be noted here that another evidence of the lack of structure in the Nebraska legislature is the small size of those scales that do exist. Those bills that scale formed many small dimensions rather than one all-encompassing one as cited in the New Jersey legislature. This particular attribute of the scales is not directly comparable with most other Guttman analyses because in many cases no attempt is made to aggregate votes from different issue areas, or in some cases different bills. However, Patterson ("Voting Behavior in a One Party Legislature"), without attempting to aggregate issue areas, found his scales averaged nine votes per scale.

voting, but not to party, then evidence is provided for hypothesis 2, that it is largely constituency differences, not party, that produces party divisions in legislative voting.

In sum, we will examine the relationship found among party identification of the legislator, his voting behavior, and the characteristics of his constituency in order to attempt to confirm or disconfirm the accuracy of the hypotheses stated above.

We may eliminate assumption 2 immediately. In none of the sessions examined, neither partisan nor nonpartisan, did the party identification of the legislator relate strongly to the urban character of his district or to its degree of industrialization. In only one session did the party of the legislator correlate highly with the partisan vote in his district (Table 2). Thus, in the Nebraska legislature, party is not a reflection of constituency characteristics, at least those we have measured.

Table 2. Relationship of Legislator's Party Identification to Some Characteristics of his District*

Year	Urban Character of District	Degree of Industrialization of District	Presidential Vote of District
1927	.14	.16	.15
1937	.17	.21	.10
1947	.15	.14	.47
1959	.13	.23	.07
1969	.11	.21	.26

* Measure used here is simple r .

Table 3 illustrates the relationship, expressed in r^2 , between party identification and each scale for each year, as well as an average overall scale. Probably the most striking fact about the table is the lack of relationship between party and voting. In only 6 of the 38 nonpartisan scales is r^2 even equal to .09, and in only 9 more is it even a minuscule .04. While the preceding section illustrated fairly well that neither party nor any other group served as a potent organizing force in the legislature, these relationships indicate that in general party has almost no influence on the voting behavior of the legislators, even in these structured votes.

In the partisan Senate, the r^2 between party and scale scores is more than .09 in about twice as many scales proportionally (five of sixteen), and its value is between .04 and .09 in about the same proportion. Thus we can see a decline in the influence of party on voting from the partisan to the nonpartisan Senates, although even in the former the relationship was hardly overwhelming. A possible cause for this lack of

influence may have been the Progressive movement: George Norris was a Nebraskan, and his influence, even at this time, may have been important. Certainly, it may logically be postulated that if Nebraska had had a strong party system in the '20s and '30s, it would have been impossible to establish the nonpartisan legislature. Thus it is not surprising to find a less than strong relationship between party and voting, even in 1927.³⁶

Obviously, then, party is not strongly related to voting in even these selected roll calls, with a few exceptions. This seems to confirm hypothesis 1a, that party leadership and organization are the crucial factors producing party voting. Although the difference in this legislature between the partisan years and nonpartisan is not large, if we acknowledge that the 1927 legislature was an example of a weak party system, then the differences seem more striking.

Turning to the variance explained by the urban or industrialized character of the constituency or its voting preferences, Table 4 indicates that one or more of the constituency variables are more important explanatory variables than party in about half of the partisan scales, but in at least three-quarters of the scales in each of the nonpartisan sessions.

While these zero-order correlations between constituency and voting are, overall, higher than the correlations between party identification and voting, most of them are not extremely high. Thus, not only party is largely unrelated to most of the scales in the nonpartisan legislature, but the constituency variables are also largely unrelated. These findings do not support hypothesis 2 in any large way. We can detect a slight shift in emphasis from party to constituency as the more important set of variables between 1927 and 1937 and since then. But the impact of these constituency variables in no way substitutes for the impact of a party in a strong partisan system, nor on the whole do these variables even explain as much variance in the nonpartisan system as in the weak Nebraskan partisan system.³⁷

³⁶ An example of the weakness of the 1927 party system and the possible impact of the Progressive movement is the election scale. This scale was comprised of bills relating to the establishment of a primary election system; this policy, of course, was one advocated strongly by the Progressives and other reformers of the era. The voting, as Table 3 illustrated, was little related to party, even though election issues are one of the kinds of issues most often found to be related to party.

³⁷ Farris found 27 scales in the House. He found correlations with party very high; only three scales had simple 4's of less than .30.

Table 5 is a summary table illustrating the variance explained in each session by the six independent variables. More variance was explained in the single partisan session than in any of the nonpartisan ones, except 1959. If these were correlations between voting choice and personal characteristics on a heterogeneous group of citizens, the correlations would seem moderately high and modestly impressive. Taken as a rough measure of a predictability of voting in a highly institutionalized organizational setting, they seem far less impressive. They seem, in fact, to indicate that voting behavior, even in these sets of roll calls that have displayed some structure, cannot be predicted by party and constituency taken together, along with two salient personal characteristics sometimes thought to be important in voting.³⁸

Unfortunately, these findings are not directly comparable with most other roll-call studies. Most of the analyses measuring the impact of party on voting have used indices of party cohesion, rather than correlational techniques.³⁹

³⁸ Breckenridge, for example, suggests that age groupings might sometimes be a factor in voting alignments. See Adam C. Breckenridge, *One House for Two* (Washington: Public Affairs Press, 1957); the discussions about social class composition of legislators indicate implicitly that social class background affects behavior in the legislature; education is not a perfect measure of social class by any means, but does correlate with it. See Donald Matthews, *The Social Background of Political Decision Makers* (Garden City, N.Y.: Doubleday, 1954).

³⁹ See for example, Turner, *Party and Constituency*; Truman, *Congressional Party*; see also David R. Derge, "Metropolitan and Outstate Alignments in Illinois and

1969	.29	.52	.04 Taxation & Appropriation	.55 Taxation & Regulation

McRae divided his legislators by party before constructing scales;⁴⁰ LeBlanc dealt only with roll calls on which there was party opposition;⁴¹ and Shannon and Froman used techniques that did not really allow them to assess the cumulative impact of both party and constituency in explaining scale score.⁴² However, the variance in scale scores accounted for by party alone in Shannon's analysis seems to be substantial.⁴³ Clausen and Chaney find that in the U.S. House the average variance explained by party alone in their economic and welfare scales is .43 and .31 respectively, and in the Senate .48 and .68. Constituency relationships were not so uniformly high, particularly in the Senate, but indices of blue-collar employment and urbanization correlated moderately with

the welfare scales and minimally with the economic scales.⁴⁴

Since what we are interested in is the relative impact of these independent variables, an attempt was made to summarize the relative impact of these variables over all scales for each session (Table 6). To arrive at a summary score measuring the importance of each variable in the scales of each session, a simple method was used: Each time a variable entered into an equation first (i.e., was the most powerful explanatory variable), it was given a score of six points; if it entered second, it was given a score of five points, etc. The scores were summed for each year and the variables ranked. In addition, Table 6 shows the number of times each variable entered into an equation first in the partisan and nonpartisan scales.

While there is a good deal of variation in the relative importance of these variables from year to year, it seems that the urbanness and degree of industrialization are the most important factors in explaining the overall voting behavior in the nonpartisan scales. They seem more important than party identification and

Table 6. Importance of Each Independent Variable in Explaining Voting in the Scales of Each Session

Characteristic	1927	1937	1947	1959	1969	First*	
						Partisan	Nonpartisan
Percentage urban in district	2.5†	2	5.5	1	4	3	11
Percentage industrialized in district*	6	5	1	5	2.5	1	9
Vote of district in last pres. elect.	5	6	4	6	1	3	3
Party identification of senator	1	1	2	4	5.5	4	8
Education of senator	4	3	5.5	2.5	5.5	4	2
Age of senator	2.5	4	3	2.5	2.5	1	5

* Unfortunately, the measures of industrialization vary. In 1959 and 1969 the figure used is based upon percentage of white collar employment in the district; in 1927 and 1937, on the percentage employed in manufacturing; in 1947, on the median years of education in the district.

† The figures represent the rank order of the independent variables in each session as computed by the simple method explained in the text. The figures in the last column represent the number of times that variable was the most powerful independent variable in the regression equation. In other words, in 11 of the 38 equations, the variable of urbanization explained more of the variance than any other variable.

much more important than the personal characteristics of the legislator or his district's presidential preferences. In the partisan legislature, party seems most important, with no clear indication of next rankings. That is, age of the senator and degree of urbanization in the district are second in total points, but the education of the senator and the vote of the district in the last election enter first into more equations than does age.

It seems significant that there is little consistency from session to session in the most important explanatory variable. This finding indicates that no outstanding alignment has been consistent over a period of time. Table 5 seems to indicate that voting patterns shift radically from session to session, with no strong underlying force providing structure for the legislators.

Table 6 treats all scales equally—those in which the R^2 for the six independent variables and scale score is .70, and those in which it is only .05. Since it seems useful to separate for closer analysis the “most important” independent variables in only those scales that are highly explainable in terms of the six given variables, Table 7 sets forth those scales in which the r^2 between the “most important”

variable and the scale scores is at least .20. These were considered the most important scales to examine, because, given the number of scales and the number of independent variables, small correlations are apt to be products of chance; and an independent variable that explains only 5 or 6 per cent of the variance in a scale score, even though it is the “most powerful” variable under consideration, cannot be thought to be shedding much light on voting behavior.

From Table 7 it seems clear that only urbanization and industrialization have much predictive power in explaining voting in the nonpartisan legislature. Party seems important only upon occasion, and one welfare scale in 1969 was most related to the senator's own background. On some occasions, therefore, constituency variables, and even occasionally party variables, do explain a goodly proportion of the voting behavior.⁴⁵

⁴⁵ The 1959 election scale, the scale most highly related to party during the nonpartisan sessions, deals with elections in a very specific, *post hoc* way. Five of the six items in the scale deal with whether the legislature should give sanction to a recount of the 1958 gubernatorial votes. The governor of Nebraska, like all

Table 7. Scales in which Voting Is Relatively Predictable

Year	Scale	Most Important Variable	% Explained by MIV	Beta MIV	R^2 All Six
1927	Taxation and Regulation	Party Identification	32%	.53	.50
	State Institutions	Urbanization	33	.77	.49
	Judiciary	Party Identification	20	.42	.27
	Taxation	Party Identification	60	.71	.79

	Health and Welfare	Senator's Education	23	.40	.39
	Licensing and Regulation	Industrialization	30	.77	.38
	Labor & Employment	Industrialization	39	.73	.43
	Regulation and Taxation	Industrialization	46	.83	.55

If we examine the remaining 21 scales in the nonpartisan sessions, and the 11 in the partisan sessions, the distribution of the most important explanatory variables is rather random.⁴⁶ It would not be unfair to speculate, given these random distributions and the small correlations, that the relatedness of the variables is almost a chance artifact of the probability that given enough variables and enough equations, something is bound to correlate with something else.

This perhaps excessively cynical view seems to suggest that in the case of this nonpartisan legislature, the structured voting is either related to differences in the urban-rural nature of the legislator's constituency (urbanization and industrialization measures), or it is not related to any of the variables under consideration.⁴⁷ In the partisan legislature, party identification seems more important, with these constituency variables related to some scales.

One might object to this whole analysis of the impact of constituency on voting in legislatures by noting that the kinds and number of independent variables are limited. We can agree that the kinds of measures concerning the nature of the constituency are crude, yet they do reflect some of the most salient factors about the constituency. While the congressman or legislator is not likely to perceive the constituency in exactly the terms used here, he is equally unlikely to ignore the large groupings of blue-collar workers, low-educated people, farmers, or whatever; these measures do give some indication of the importance of these groups in each district.⁴⁸ A conceivably important factor not considered in this analysis is the legislators' attitudes and sympathies toward interest groups. These attitudes may partially reflect gross constituency characteristics (a per-

his gubernatorial counterparts, is elected on a partisan ballot. Thus, there was a grand opportunity in the legislature for Democrats and Republicans to take sides on an issue of immediate and great partisan concern. While party identification did show more correlation with this set of issues than any other, still only 41 per cent of the variance was accounted for by party.

⁴⁶ Distribution of Most Important Variable in Other Scales:

	Age	Urbanization	Party Identification	Industrialization	Partisan Vote	Education	Total
Partisan	1	2	1	0	3	4	11
Nonpartisan	5	5	4	3	3	1	21

⁴⁷ Francis's more impressionistic conclusion was that in Nebraska the major source of conflict was the urban-rural difference (Francis, *Legislative Issues in 50 States*).

son representing a heavily blue-collar district is not likely to be unsympathetic with labor groups), but may contain dimensions unrelated to these characteristics. Further, the data presented here did not take into account personal attitudes of the legislators toward various economic, political, and social issues. Individual attitudes, of course, may or may not reflect constituency opinion.⁴⁹ However, data on attitudes toward interest groups and toward some economic, social, and political issues were collected for about half of the legislators in the 1969 session. Adding these variables into the regression equations did not significantly improve predictability in voting for even this small group. This is only a small and perhaps misleading bit of evidence, however, since the measures of social and economic liberalism used were rather crude ones.

In terms of individual voting behavior (as contrasted with overall voting structure), if we return to our original hypotheses and assumptions concerning their validity, we find that the data seem to rule out 1b and 1c, because clearly party is not strongly related to voting in any consistent way. The verdict on hypothesis 2 is less clearcut, because in some scales constituency does explain a large amount of the variance, while in others it explains very little. If we remember, however, that a large proportion of the roll calls did not scale at all, then hypothesis 2 does not appear to be strongly supported. In sum, when the nonpartisan legislature is used as a control, the observed lack of both structure and explainability in voting behavior must lead one to conclude that it is the organization and discipline of party leadership that produce strong party voting in legislative bodies.⁵⁰

⁴⁸ For a good discussion of this point see Froman, *Congressmen and Their Constituencies*.

⁴⁹ See Miller and Stokes, "Constituency influence in Congress."

⁵⁰ The causal factors relating to a strong party leadership within the legislature are another question. And, in fact, party leadership may be forthcoming from outside the legislative body. Van der Slik et al. found that voting in one kind of nonpartisan setting, without

party leadership organized formally within the legislative body, could be strongly influenced by partisan preference (Jack Van der Slik, David Kenney, and

Issues and Voting in a Nonpartisan Legislature

One of the consistent findings of those who have examined partisan legislatures, even highly partisan bodies, is that some issues are more highly partisan than others. Less consistent have been the findings about exactly which issues are more partisan. Regional conflict was found in apportionment and local government issues, as well as in issues of constitutional revision, civil rights, and sometimes in social welfare.⁵¹ Jewell found party conflict high in the areas of labor, elections, constitutional amendments, legislative organization, and natural resources; intermediate party conflict was found on appropriations, welfare, state offices, and schools.⁵² Wiggins in Iowa discovered high party conflict on labor, legislative organization, elections, constitutional amendments, and national issues, intermediate conflict on appropriations, welfare, state offices, and schools.⁵³ In the Oklahoma one-party legislature, Patterson found taxation a product of conflict with urban-rural coalitions, elections related to political competitiveness, education to socio-economic constituency variables, and public morals to rural-urban differences.⁵⁴ LeBlanc, in his analyses of state senates, observed that business regulation and health and welfare issues tended to be less partisan than revenue, appropriations, labor, legislative organization, and elections.⁵⁵

We will hypothesize that in a nonpartisan legislature, only those issues that are directly related to the fortunes of the parties and those tied most directly to national issues will be characterized by a high degree of partisan conflict: particularly election issues and certain kinds of social welfare legislation that are the

subject of national controversy. We will further hypothesize that issues relating to local government, agriculture, spending, and taxation will be related to rural-urban differences in constituency.

Table 8 indicates that our hypotheses are only partially confirmed. The social welfare issues in the 1937 scale were related quite directly to Roosevelt's New Deal proposals, and the election scale of 1959 was related quite directly to the fortunes of the two parties (see footnote 45); therefore, the finding that these issues are related to party is expected. The state institutions scale of 1937 is less related to any national issue, although since it dealt with court and prison reform largely, it may be capturing a liberal-conservative or Roosevelt-anti-Roosevelt alignment. The salary scale of 1969 may be viewed as a gubernatorial support series of votes.⁵⁶

Most of the spending and taxation scales that showed any relationships (and this includes the salary scales, and the social welfare scale of 1959 which contained several bills relating to increasing unemployment compensation) were related to constituency. More than half of these bills, however, were not strongly correlated with any variable, nor were most of the local government scales and agriculture related to any variable under consideration.

In sum, the hypotheses about party and constituency conflict are moderately substantiated. Different patterns of conflict occur with different kinds of bills. On the whole, however, party conflict was found only rarely (and two of the four scales on which there was party conflict were found in 1937).

Conclusions and Implications

The above findings indicate that there is relatively little structure in voting in the Nebraska legislature. This suggests not only that party is the most important reference group in structuring legislative behavior but also that in the absence of party, no other kind of reference group serves a similar purpose.⁵⁷ Even though

Samuel J. Pernacciaro, "Roll Call Voting Patterns in the Illinois Constitutional Convention: A Regression Analysis," paper presented at the Midwest Political Science Association Meeting, Chicago, Illinois, April, 1972). This nonpartisan constitutional convention was, of course, operating within the very highly partisan political setting in Illinois; many of the members, although nominally nonpartisan, were responsible to the Democratic organization of Cook County; others had strong party ties to downstate Republican and Democratic organizations. See also Caleb and Janet Clark, "The Impact of Electoral and Party Systems upon Political Conflict in State Constitutional Conventions," paper presented at the 1972 Southwestern Social Science Convention, San Antonio, Texas, March, 1972.

⁵⁶ The Governor, labeled a "progressive" Republican, had in his tenure from 1966 to 1970, embarked upon an effort to modernize both the fiscal structure and the organization of state government of Nebraska. Increasing the salaries of high state officials to make them more competitive with business and other states was one among many examples of what his opponents viewed as wasteful spending. Thus, many of these measures were opposed by the Democrats and were capitalized upon in the successful Democratic gubernatorial campaign in 1970.

⁵⁷ This finding is supported by the relative lack of structure found by Carlson, "Five State Legislatures," in the weakly partisan California legislature of the late

Table 8. Scales: Party and Constituency Conflict

Issue	Number of Scales in Nonpartisan	Scales highly Related to Party, $r^2 \geq .20$	Scales highly Related to Constituency, $r^2 \geq .20$

Civil Liberties	2	0	0
Agriculture	1	0	0
Private Bills	1	0	0

strong constituency differences exist, and in Nebraska the urban-rural nature of constituency is superimposed on regional differences, constituency is not a strong factor around which voting can be consistently organized.

If we examine those votes that do display structure (that is, those that scale), we find that the majority are not explainable to any large extent by party, constituency, or personal variables. Voting is simply not predictable from the kinds of measures utilized here. Obviously other variables than party identification, rural nature of the constituency, or age enter into a voting decision. Such influences as one's attitude toward an issue, susceptibility to interest group pressure, the legislator's personal desire to do a favor for a colleague—these sorts of influences are not being measured directly by the data at hand, yet they might be real influences on behavior.⁵⁸ Still, these influences are probably not entirely divorced from the constituency and party characteristics we have examined.

What implications does this lack of apparent predictability and order in voting have? One that is immediately apparent concerns the responsibility of elected officials to their constituents. While citizens do not generally think of parties in terms of ideology or policy, most Americans know even less about the policies and platforms of their legislators.⁵⁹ Thus, re-

moving this most salient cue of party identification for most voters would seem to be taking away one means of a rational voting choice, just as removing party organization seems to take away the most salient cues for the legislator.

One of the original motives behind political nonpartisanship was, in Norris's words, to give the people more power in their government by eliminating corruption caused by "crass" political deals and putting government on a business-like basis. It is difficult to see how constructing a setting in which there is no consistency in behavior on the part of representatives and little knowledge on the part of electors can give the people more power. While there are undoubtedly virtues in a nonpartisan system unrelated to the question of responsibility, to that question at least, a nonpartisan legislature seem to be a less than satisfactory answer.

Opinion Quarterly, 26 (Winter, 1962), 531-46. It seems probable that Nebraska voters are neither more nor less informed about politics than their counterparts elsewhere. A survey taken in Lincoln, Nebraska, during the election campaign of 1970 found 56 per cent of the population unable to name their congressman, 32 per cent unable to name their congressman's party (and one can assume that some of the remaining 68 per cent were guessing). Of course, for the segment of the population that is much more aware and informed, even about policy issues, the nonpartisanship of the legislature would be less of a hindrance to some sort of rational voting behavior than for the public at large. For information on this public, see G. R. Boynton, Samuel C. Patterson, and Ronald D. Hedlund, "The Missing Links in Legislative Politics: Attentive Constituents," *Journal of Politics*, 31 (August, 1969), 700-21; and Robert S. Erikson, "The Electoral Impact of Congressional Roll-Call Voting," in *American Political Science Review*, 65 (December, 1971), 1018-32.

1950s and the Tennessee legislature, where again, strong parties did not exist at that time in the legislature.

⁵⁸ Again, for a discussion on the use of constituency data as an indicator of real constituency preferences, see Fröman.

Foreign Aid and United Nations Votes: A Comparative Study*

EUGENE R. WITTKOPF

University of Florida

Introduction

Reaction in the United States to the decision of the United Nations General Assembly on the China issue has raised anew the question of whether foreign aid has or has not been, indeed, should or should not be, used as a political instrument by the United States in seeking compliance by other states with its foreign policy positions. According to *The New York Times*, Senator Hugh Scott was "expressing a common resentment" when he observed that "a good many nations we have helped generously with foreign aid over many years have shown a classic lack of appreciation." Similarly, the *Times* reports that Senator J. W. Fulbright "suggested that rather than cutting back on United States contributions to the United Nations, Congress might reduce foreign aid to countries that had voted against the United States position on China."¹

The purpose of this essay is to apply empirical evidence to the "has or has not" portion of the debate. Specifically, its purpose is to examine in a comparative foreign policy framework the relationship between political outcomes in the General Assembly, as represented by roll-call voting agreements across an entire set of roll calls, and foreign aid allocations, one of a myriad of extraorganizational links between UN members. In principle, the inquiry will be concerned with the extent to which foreign aid is an instrument of influence in the General Assembly. In propositional form, we will be con-

cerned with the hypothesis that *the larger the agreement in General Assembly voting exhibited by a developing state with a foreign aid donor, the greater will be the amount of aid it receives from that donor*. At the same time, however, we will also be concerned with the reverse formulation of the proposition, i.e., whether the allocation of donors' aid dollars can be used to describe and explain the voting preferences of developing nations. We will examine the covariation between pairwise voting patterns in the 1963 (Eighteenth) and 1966 (Twenty-first) General Assemblies and the allocation of foreign economic assistance in two three-year periods, 1962-1964 and 1965-1967. Initially attention will be focused on the United States. The results for the U.S. will then be compared with those for other aid donors to ascertain their similarity or dissimilarity. The donors that will be compared with the U.S. are the Soviet "bloc"² and the twelve UN members (other than the U.S.) of the Development Assistance Committee (DAC) of the Organization for Economic Cooperation and Development (OECD).³

² Lack of aid data on a dyadic basis has required the aggregation of the Soviet Union and other Communist nations into a single actor, referred to somewhat unhappily as a "bloc." For purposes of the 1962-1964 aid data, the Soviet "bloc" comprises the Soviet Union, Bulgaria, Mainland China, Czechoslovakia, East Germany, Hungary, Poland, and Rumania. With the exception of Mainland China, the same states comprise the Soviet "bloc" for purposes of the 1965-1967 aid data.

³ Austria, Belgium, Canada, Denmark, France, Italy, Japan, the Netherlands, Norway, Sweden, and the United Kingdom. Australia, though not a DAC member until 1966, is included in the 1965-1967 analyses.

Although the DAC donors and the Soviet "bloc" nations together contribute the vast bulk of bilateral economic aid flows in the international system, several other states do maintain modestly sized bilateral programs, many of them in the area of technical assistance. Finland and New Zealand are among the developed nations maintaining such programs. Spain, Kuwait, Yugoslavia, the United Arab Republic, Nationalist China, Israel, India, Brazil, Mexico, and Venezuela are among the developing nations that reportedly maintain some such program, often in conjunction with a multilateral effort. See Organization for Economic Cooperation and Development, *The Flow of Financial Resources to Less-Developed Countries 1961-1965* (Paris: O.E.C.D., 1967), pp. 59-61; Organization for Economic Cooperation and Development, *Resources for the Developing World* (Paris:

* Support for the research reported in this article was made available by the Department of Political Science, University of Florida, and the International Relations Program, Syracuse University, assistance that is gratefully acknowledged. I wish also to acknowledge with appreciation the advice and encouragement of Michael K. O'Leary, Steven J. Brams, James E. Price, William D. Coplin, and Patrick J. McGowan. The research reported here is a revised and expanded version of my "The Concentration and Concordance of Foreign Aid Allocations: A Transaction-Flow Analysis," in *Locational Approaches to Power and Conflict*, ed. Kevin R. Cox and David R. Reynolds (Beverly Hills, Calif.: Sage Publications, 1973), in which the covariation between aid allocations and voting agreements in 1963 is examined. Also examined in that study is the relationship between aid allocations and trade flows and diplomatic exchanges between developed and developing nations.

¹ *The New York Times*, October 27, 1971, p. 16.

The Aid and Voting Nexus

Foreign aid has often been used in studies concerned with general patterns of state behavior in and toward the United Nations.⁴ Little empirical or comparative work, however, has attempted to isolate what role foreign aid may play in the political processes of the organization, or how these processes and their outcomes may influence other types of foreign policy behavior, such as aid allocations.⁵ Yet the implication that aid influences voting behavior, or vice versa, is frequently suggested in the literature on both the United Nations and foreign aid, particularly as it relates to the United States. A brief, suggestive discussion of some of this literature will provide a background for the subsequent empirical analysis.

The suggestion that foreign aid is used as a bargaining tool in securing UN votes is spelled out clearly by Robert O. Keohane in his study, "Political Influence in the General Assembly."⁶ "Certain states in the Assembly are very susceptible to bilateral pressure," he writes, "no matter how subtle its application may be. The more dependent a state is on a greater power for trade, aid, or protection, the more responsive it is likely to be to pressure."⁷ Similarly, he

O.E.C.D., 1970), pp. 289-91; and Organization for Economic Cooperation and Development, *Development Assistance: Efforts and Policies of the Members of the Development Assistance Committee, 1969 Review* (Paris: O.E.C.D., 1969), pp. 60-63. Unfortunately, the data necessary for a systematic analysis of the aid programs of these donor countries comparable to that undertaken for the donors included in the study are not available. In fact, even in the case of the Soviet bloc, as will be noted below, the data are not comparable to those available for the DAC donors, thus leading to the presentation of two separate sets of results. However, the interest usually attached to Soviet aid programs seems to warrant its (their) inclusion.

⁴ See, e.g., Hayward R. Alker, Jr. and Bruce M. Russett, *World Politics in the General Assembly* (New Haven, Conn.: Yale University Press, 1965), pp. 226-27; Hayward R. Alker, Jr., "Dimensions of Conflict in the General Assembly," in *Approaches to Measurement in International Relations*, ed. John E. Mueller (New York: Appleton-Century-Crofts, 1969), pp. 163-65; and John F. Clark, Michael K. O'Leary, and Eugene R. Wittkopf, "National Attributes Associated with Dimensions of Support for the United Nations," *International Organization*, 25 (Winter, 1971), 1-25.

⁵ Two examples of studies that use UN votes to examine aid allocations are Masakatsu Kato, "A Model of U.S. Foreign Aid Allocation: An Application of a Rational Decision-Making Scheme," in Mueller, *Approaches to Measurement in International Relations*, pp. 204-10; and Wynfred Joshua and Stephen P. Gibert, *Arms for the Third World* (Baltimore: The Johns Hopkins Press, 1969), pp. 140-43.

⁶ Robert O. Keohane, "Political Influence in the General Assembly," *International Conciliation*, No. 557 (March, 1966).

⁷ Keohane, p. 19.

notes, "Threats of retaliation of one sort or another—reducing foreign aid, for example—usually need not be made explicit. Often it is sufficient that the smaller state is aware that 'Big Brother' is watching."⁸ Keohane also points out, however, that foreign aid is unlikely to be used as a bargaining tool by all foreign aid donors.

Despite the United Nations' commitment to the use of rational and deliberative procedures, states attempt to coerce one another to support their positions. Yet even the most "realistic" observer of the General Assembly will quickly realize that attempts to achieve results by using extra-parliamentary threats—for instance, the threat to reduce foreign aid—are almost entirely limited to the two great powers. Nowhere is bipolarity more marked.⁹

The use of aid by the United States to influence voting behavior is suggested by Edward S. Mason, who writes that "diplomats are frequently worried by voting records in the United Nations and suggest that an increase in aid to their particular country would improve this record."¹⁰ Lloyd D. Black has been more direct.

⁸ Keohane, p. 19.

⁹ Keohane, pp. 17-18. See also David A. Kay, "Instruments of Influence in the United Nations Political Process," in *The United Nations Political System*, ed. David A. Kay (New York: John Wiley & Sons, 1967), p. 105.

Keohane also suggests that "most decisions of the General Assembly . . . are not important enough to United States interests for it to threaten convincingly to alter the level of aid or support that it is giving, or to exercise other forms of pressure . . . for the sake of gaining a few more votes in the United Nations" (Keohane, p. 20). And he argues that the changing composition of the United Nations has probably made bilateral pressure less important than it was, say, in the 1950s (pp. 19-20).

Still, this caveat does not obviate the likelihood that foreign aid is a significant factor conditioning states' voting behavior, particularly where aid represents part of a general dependency relationship between a developing nation and an aid donor. In discussing the "appeal for good relations" as a form of bilateral pressure, for example, Keohane observes that the threat implicit in this appeal ". . . may become a painfully acute form of pressure if it is exercised by greater powers and directed toward states that depend on them for aid or support" (p. 18).

Jack C. Plano and Robert E. Riggs also observe that most UN votes are not sufficiently important to warrant a threat to alter aid levels. See *Forging World Order* (New York: Macmillan, 1967), p. 154. In an earlier work, however, Riggs discusses the difficulty of separating specific uses of aid to secure compliance in the UN from the general relationship likely to hold between these two variables; see Robert E. Riggs, *Politics in the United Nations: A Study of United States Influence in the General Assembly* (Urbana: University of Illinois Press, 1958), pp. 38-39. The important point, of course, is that whether aid is or is not related to votes remains an empirical question.

¹⁰ Edward S. Mason, *Foreign Aid and Foreign Policy* (New York: Harper and Row, 1964), p. 33.

He observes that "the State Department . . . places high value on the employment of foreign aid to . . . swing critical votes in international bodies. . . . While UN votes may not, and should not, be the primary determinant in aid decisions, it is reasonable to assert that they cannot be ignored—nor are they."¹¹

On the other hand, Francis O. Wilcox, former Assistant Secretary of State for International Organization Affairs, has argued that as a matter of *policy*, the United States eschews the use of foreign aid or similar devices to influence the behavior of UN members.¹² Interestingly, however, the section of Wilcox's article in which he makes this argument is entitled "U.N. Votes and Foreign Aid," carrying a subtle implication, quite apart from the argument itself, that there is something more than a random relationship between these two variables. Similarly, Black's normative view that UN votes should not be the "primary determinant in aid decisions" is echoed by other writers, again implying that foreign aid and UN votes are in fact nonrandomly associated. Mason, for example, has expressed the opinion that foreign aid is "frequently not a very useful instrument" for purposes of "influencing behavior in the United Nations."¹³ Similarly, Charles Wolf, Jr. has asserted that "winning votes in the UN" is an "unreasonable" objective of foreign aid,¹⁴ and Jacob J. Kaplan has expressed the view that ". . . the United States should not seek to starve a poor country into support of its foreign policy. An incentive system cannot operate in the case of every vote in the United Nations or every meeting of developing nations."¹⁵

But at least one writer has argued that policy makers should give more, not less, attention to how foreign aid might be used to influence political outcomes in the United Nations. In the concluding section of his study of *Foreign Aid in a Foreign Policy Framework*, Andrew F. Westwood argues that the "alignment of underdeveloped countries in the Cold War" has been of concern to the United States for two reasons: first, because of the felt need for general ideological support in the competitive struggle

with the Soviet Union; and second, because of ". . . the need for cooperation, and the give and take which produces it, on a wide variety of issues and problems, notably in the United Nations."¹⁶

Westwood concludes that "the efforts to press aid into service [for purposes of general ideological support] probably can be summed up as unnecessary and ill-suited indeed to this realm of ideas and emotions."¹⁷ On the other hand, he argues that the need to apply foreign aid to promote "cooperation" on a "wide variety of issues and problems" has not waned but in fact has become more important.

This [need] has not faded but grown as more underdeveloped countries have entered the United Nations and the necessary majorities there increasingly have depended on their votes. The idea that no *quid pro quo* should be asked in return for aid has governed here as well [as in the area of general ideological support], although practice has diverged from it on occasion. But here the idea has a different character—not that ideological support is too gross a return for aid, but any return, even support on an issue in which the underdeveloped country may have little interest, is inappropriate. It seems likely that one of the major questions for the future is whether aid should not be included within the broad process of give and take on concrete issues which produces cooperation among mature, independent, and equal nations.¹⁸

Data and Methodology

Scope of the analysis. The UN votes analyzed are all committee and plenary roll calls taken in the Eighteenth and Twenty-first General Assemblies, a total of 78 in 1963 and of 163 in 1966. Attention is focused on the relationship between aid and voting preferences of developing states identifiable on the basis of all of these votes; no attempt will be made to identify "critical" votes or specific issues of particular significance to either aid donors or recipients.¹⁹ It is

¹³ Westwood, p. 105.

¹⁴ Cf. Alker, "Dimensions of Conflict in General Assembly," pp. 163–64. Much additional work has been undertaken to determine whether a "critical vote" or "issue-area" approach might be a preferable way to address the question examined in this essay. Generally speaking, the results of these analyses suggest that neither of these alternatives is preferable to the generalized approach that has been chosen. For example, a contingency table analysis of developing nations' voting behavior on the China issue and their U.S. aid receipts during 1961–1967 indicated that aid allocations and voting behavior are quite probably independent of one another. See Eugene R. Wittkopf and James Green, "Empirical Perspectives on the

important to emphasize, therefore, that the purpose here is to ascertain whether a relationship between donors' aid allocations and recipients' voting behavior exists as a general phenomenon.

The aid recipients used in the statistical analyses were selected from a population of developing nations defined as independent nations that received foreign economic assistance from one or more of the sixteen members of the OECD's Development Assistance Committee²⁰ or from the Soviet bloc during one or more of the six years spanned by the study. So defined, the possible number of observations used in the study varies from 85 in 1962 to 96 in 1967.²¹ A

China Vote and U.S. Foreign Aid, 1961-1967" (paper, University of Florida, January, 1972). Similarly, work has been done using only those votes on which the United States and the Soviet Union did not agree. The results obtained differ only marginally from those displayed later, which employ all Assembly roll calls. Finally, an effort was made to replicate Bruce Russett's factor analysis of UN votes in 1963 in which he found five "super issues" in the General Assembly; see Bruce M. Russett, *International Regions and the International System* (Chicago: Rand McNally, 1967), pp. 63-67. VRA scores (discussed later) were calculated for those votes that loaded at .5 or greater on each of the three most important dimensions in the 1963 Assembly (cold war, 20 votes; intervention in Africa, 17 votes; supranationalism, 18 votes). The VRA's were then correlated with the 1962-1964 U.S. aid RA's (also discussed later). The results are given below (Table A). Although some interesting differences across the various dimensions are apparent, the important point is that the conclusions that can be drawn about the association between aid and votes (or lack of association) do not differ dramatically from those that can be drawn on the basis of looking at all roll-call votes. (See Table 3.)

Table A. U. S. Aid Allocations and U. N. Voting Agreements: Correlations Between 1962-1964 Relative Allocation Indices and 1963 Relative Agreement Indices Calculated by Issue-Area^a

	Cold War	Intervention in Africa	Supranationalism
1962	.26* (67)	.15 (67)	-.04 (67)
1963	.21* (68)	.18 (68)	-.009 (68)
1964	.32* (63)	.45* (63)	-.07 (63)

^a Correlations statistically significant at the .05 level are indicated by an asterisk.

²⁰ West Germany, Portugal, and Switzerland are members of DAC in addition to those nations cited earlier. Aid flows from Germany and Switzerland have been included in the aid matrices analyzed using the transaction-flow model. Portugal is excluded since it extended aid only to its overseas territories.

²¹ These numbers as well as the nations listed in

list of these recipient nations is given in Table 1.

Although by 1967 there were, according to the criteria set forth above, as many as 96 foreign aid recipients, no one donor actually extended aid to all of these potential recipients in any one of the six years analyzed. In fact, the number of recipients for each donor varies greatly; in 1964, for example, the United States extended some form of economic assistance to 77 developing nations, while in the same year France aided only 26 independent nations. Throughout the analysis, attention for each donor country is confined to that subset of developing states to which the donor actually distributed foreign aid.

Three additional criteria are used to delimit the actual number of aid recipients included in the subsequent analyses. First, for reasons discussed below, attention is restricted to those aid recipients that received some *positive* amount of aid from each donor analyzed. Second, only those UN members that missed 40 per cent or fewer of the roll calls in each General Assembly are included in the roll-call analyses. Although this is an arbitrary figure, some minimum number of recorded votes seems necessary since much of the subsequent analysis is based on the behavior of all or major subsets of UN members. Finally, attention is restricted to those aid donors that distributed foreign aid to eight or more developing nations beyond those excluded according to the aforementioned criteria.²²

Confining attention to the actual recipients of aid for each donor is especially important. In effect, it amends the proposition being examined to read *given that a nation receives aid from a particular donor country*, the larger its voting agreement with that donor, the greater will be the amount of aid it receives from that donor. Because of this restriction, it might be argued that the empirical results presented later are in fact not addressed to a critical factor, namely, that the level of agreements between a foreign aid donor and its aid recipients may be

Table 1, include such non-UN members as South Korea, Muscat and Oman, South Vietnam, and Western Samoa. Although these nations are, by definition, excluded from the correlation analyses, they are included here since their aid receipts from the DAC donors have been included in the aid matrices analyzed using the transaction-flow model.

²² Again, there is nothing magic in the number eight; it is simply the minimum number of developing nations included for which data on Soviet bloc assistance are available. But with an N less than eight, the technique of fitting a line to data points is either inappropriate, or the number of observations is so small as to severely restrict the generalizability of the empirical findings.

Table 1. Names and Abbreviations of the Ninety-Six Independent Foreign Aid Recipient Nations Included in the Study^a

Abbreviation	Nation	Abbreviation	Nation
1 AFGH	Afghanistan	49 LIBE	Liberia

48 LESO	Lesotho	96 ZAMB	Zambia

^a All nations shown were independent by the end of 1967. Those not independent throughout the 1962-1967 time period are listed below, followed by the year in which they achieved independence.

ALGE—1962	GUYA—1966	MLWI—1964	SING—1965	WSAM—1962
BOTS—1966	JAMA—1962	MALD—1965	SOAF—1967	ZAMB—1964
BURU—1962	KENY—1963	MALT—1964	TRIN—1962	
GAMB—1965	LESO—1966	RWAN—1962	UGAN—1962	

Source for determination of the year of independence is Bruce M. Russett, J. David Singer, and Melvin Small, "National Political Units in the Twentieth Century: A Standardized List," *American Political Science Review*, 62 (September, 1968), 935-950.

^b Zaire.

^c Including Aden.

significantly different from (presumably greater than) the level of agreements between a donor and its nonrecipients. Put differently, "between-group" differences may be more significant than "within-group" differences. Accordingly, some empirical evidence to be presented later specifically addresses the question of between-group differences. It will be shown that, on the basis of this analysis, there is little evidence to support the proposition that restricting the analysis to those developing nations that actually receive aid from each donor country analyzed restricts the generalizability of the empirical findings.

To examine the dual notion that aid allocations may be either a cause or a consequence of voting behavior—that is, that aid may be either an inducement to future behavior or a reward (or punishment) for past behavior—the 1963 voting data were correlated with both 1962 and 1964 foreign aid data, and the 1966 voting data were correlated with both 1965 and 1967 aid data. Further, because the General Assembly meets in the Fall of each calendar year, while foreign aid is presumably distributed throughout the year (probably most of it prior to that point in the annual Assembly meeting at which most roll-call votes are taken), correlations between the 1963 aid and 1963 voting data and between the 1966 aid and 1966 voting data have also been included.

Based on the assumption of a one-year lag between the variables, if foreign aid is more consistently used as an *inducement* to future behavior within the Assembly than as a reward for past behavior, then we would expect that the aid and voting correlations would be higher when the aid data refer to the year either prior to or during the Assembly year than when the aid data refer to the year following the Assembly. Conversely, if aid is used as a *reward* (or punishment) for past behavior, then we would expect the correlations lagging behind the aid data by one year to be the greater.²³

Despite the conceptual distinction between the use of aid as an inducement or as a reward, it would be surprising if the analyses were to unearth this distinction. The considerable stability in the distributional patterns of donors' foreign aid can easily be demonstrated.²⁴ Simi-

larly, other writers have documented that over time the basic issues and alignments in the General Assembly have remained largely unchanged.²⁵ Consequently, significantly different patterns in the relationship between aid and voting during any two- or three-year period are most unlikely to occur—and in fact they do not occur. Therefore, the net result of this analysis (i.e., using the concept of a variable lag structure in exploring the relationship between foreign aid and UN voting) will be to document further the stability of these two basic measures of relations among nations.

Foreign aid data and indices. Foreign aid data for the DAC donors were drawn from three publications of the OECD on the geographical distribution of financial flows to developing nations.²⁶ All data for the DAC donors refer to net *disbursements* of foreign economic assistance;²⁷ neither commitments nor military aid data are included. Data on 1962–1964 Soviet bloc aid were drawn from two United Nations publications,²⁸ while those for 1965–1967 were drawn from three publications of the U.S. De-

²³ See, e.g., Russett, *International Regions*, pp. 59–93.

²⁶ *Geographical Distribution of Financial Flows to Less Developed Countries 1960–1964* (Paris: O.E.C.D., 1966); *Geographical Distribution of Financial Flows to Less Developed Countries 1965* (Paris: O.E.C.D., 1967); and *Geographical Distribution of Financial Flows to Less Developed Countries 1966–1967* (Paris: O.E.C.D., 1969).

²⁷ The OECD uses the term "net total official financial flows" to describe these data. The flows are defined as the sum of grants, including grants for technical cooperation; intergovernmental reparation and indemnification payments, a type of disbursement remitted only by Italy and Japan throughout the 1962–1967 time period, and by West Germany until 1965; net official loans; loans repayable in recipients' currencies (net); and transfers of resources through sales for recipients' currencies (principally food aid distributed under the aegis of U.S. Public Law 480). O.E.C.D., *Geographical Distribution 1960–1964*, p. XII.

It will be noted that the aid data do not distinguish between various budgetary categories and administrative agencies in donor countries. In effect, therefore, it is assumed that the aid data comprise the foreign policy output of an aggregate decisional unit in each donor country. This is admittedly a very powerful assumption (as Graham T. Allison has clearly demonstrated in his *Essence of Decision* [Boston: Little, Brown, 1971]) that should perhaps be subjected to additional research. But use of the OECD-DAC data does allow one to move beyond what Baldwin has identified as the tendency to define foreign aid in terms of American institutions. See David A. Baldwin, "Analytical Notes on Foreign Aid and Politics," *Background*, 10 (Winter, 1966), 75–76.

²⁸ *International Flow of Long-term Capital and Official Donations, 1961–1965* (New York: U.N., 1966), pp. 22–23; and *The External Financing of Economic Development* (New York: U.N., 1969), pp. 44–45.

²³ It is because of the absence of an a priori rationale for assuming which temporal sequence is more likely to hold that correlation rather than regression analysis has been chosen as the analytical technique.

²⁴ See Eugene R. Wittkopf, "The Distribution of Foreign Aid in Comparative Perspective: An Empirical Study of the Flow of Foreign Economic Assistance, 1961–1967" (Ph.D. dissertation, Syracuse University, July, 1971), pp. 38–41.

partment of State.²⁹ Data on Soviet bloc aid refer to *commitments* of economic assistance (grants and credits), not to disbursements. It should be borne in mind, therefore, that the DAC and Soviet bloc data differ in kind; moreover, the fact that the Soviet bloc data are commitments rather than disbursements may help explain the relatively small number of cases displayed later for the Soviet bloc. Because of the definitional distinction between DAC and Soviet bloc data, two separate sets of analyses of the relationship between aid and votes will be included, one excluding Soviet bloc aid, the other including the data in the analyses.

Given the definition of foreign aid employed for the DAC donors, it is possible that recipients may make net repayments of aid to donors in excess of their gross aid receipts. In effect, these developing nations are "recipients" of "negative total aid." Since the total aid definition across the entire range of recipients is a net definition, it would seem most reasonable to retain all recipient states for a particular donor in the subsequent analyses, even when their total aid receipts fall below zero. Negative aid flows, however, can markedly affect the relative allocation indices used as one of the empirical measures of aid allocations. Hence, all negative aid values were excluded from the aid matrices prior to computing the relative allocation indices using the transaction-flow model. To retain comparability across the various analyses, negative aid flows have also been excluded from the correlation analyses based on the absolute vol-

ume of aid allocated by aid donors among developing nations.

The first foreign aid variable used in the correlation analyses is the absolute amount of foreign aid allocated by an aid donor among its aid recipients. The second measure used is based on a transaction-flow analysis of the aid data. The transaction-flow model used is a version of the original model devised by I. Richard Savage and Karl W. Deutsch,³⁰ as revised by Leo A. Goodman³¹ and programmed by Steven J. Brams.³² This model's principal merit in studying aid allocations is that it provides a common denominator for data on the aid programs of donors otherwise vastly disparate in terms both of their magnitude and geographical scope of activity. Further, it allows one to tie all donors together into a single "system" so that the aid activities of donors relative to one another can easily be described.

The transaction-flow measure used is the *RA* index, referred to as a "relative allocation" index.³³ The measure is defined as

$$RA_{ij} = \frac{A_{ij} - E_{ij}}{E_{ij}},$$

where

RA_{ij} = the relative allocation of foreign aid from the i^{th} donor to the j^{th} recipient,

E_{ij} = the expected allocation of foreign aid from i to j , and

A_{ij} = the actual allocation of foreign aid from i to j .³⁴

³⁰ I. Richard Savage and Karl W. Deutsch, "A Statistical Model of the Gross Analysis of Transaction Flows," *Econometrica*, 28 (July, 1960), 551-72.

³¹ Leo A. Goodman, "Statistical Methods for the Preliminary Analysis of Transaction Flows," *Econometrica*, 31 (January-April, 1963), 197-208; and Leo A. Goodman, "A Short Computer for the Analysis of Transaction Flows," *Behavioral Science*, 9 (April, 1964), 176-86.

³² Steven J. Brams, "A Generalized Computer Program for the Analysis of Transaction Flows," *Behavioral Science*, 10 (October, 1965), 487-88.

³³ The more commonly accepted term for transaction-flow *RA*'s is "relative acceptance" indices. "Relative allocation" has been chosen for the aid *RA*'s, however, since this seems a more accurate reflection of the nature of foreign aid monies treated as transaction flows given the absence of a two-way flow of funds.

³⁴ The reason for excluding negative aid flows from the analysis should now be apparent. If both A_{ij} and E_{ij} are negative, and the former is greater than the latter, RA_{ij} can be a positive number, indicating aid flows greater than an indifferent amount, despite the fact that it is based on a negative A_{ij} . Intuitively, this is, of course, an unreasonable result. More importantly, the *RA* for a second donor, k , assuming k also allocates aid to recipient j , can be markedly inflated due to the negative flow from i to j , thereby causing RA_{kj} to have an extreme effect on the correlation coefficient used to assess the association between donor k 's aid allocations and developing nations' voting agreements with k .

²⁹ Director of Intelligence and Research, *Communist Governments and Developing Nations: Aid and Trade in 1965* (Research Memorandum RSB-50, June 17, 1966), p. 2; Director of Intelligence and Research, *Communist Governments and Developing Nations: Aid and Trade in 1967* (Research Memorandum RSE-120, August 14, 1968), pp. 2-3; and Director of Intelligence and Research, *Communist Governments and Developing Nations: Aid and Trade in 1968* (Research Memorandum RSE-65, September 5, 1969), pp. 2-3. UN data have been used for the first three years since State Department estimates of Soviet bloc data are not available on an annual basis for all of the years 1962-1964. State Department estimates have been used for the later three-year period rather than UN estimates on the assumption that the former are more accurate than the latter. UN data apparently were collected from unofficial sources such as press releases as well as official Soviet and East European publications. The State Department, on the other hand, presumably received its information directly from recipient nations. It is assumed, therefore, that the margin of error is less in the State Department than in the UN data. See also Vassil Vassilev, *Policy in the Soviet Bloc on Aid to Developing Countries* (Paris: Development Centre of the Organization for Economic Cooperation and Development, 1969), pp. 61-66.

The expected value, E_{ij} , is calculated on the basis of the allocation of each donor's total aid volume as distributed proportionally among all of the recipients included in the "system" analyzed. The model assumes that donor i will send to recipient j approximately the same percentage of its total foreign aid as the percentage of the total aid which j receives from all donor countries combined. If, for example, Argentina receives 10 per cent of the total aid disbursed by the DAC members, the model predicts that Argentina will receive 10 per cent of whatever percentage each donor contributes to the total volume of aid disbursed by all of the DAC members. Because the model is indifferent to all other factors or variables, it is sometimes referred to as an indifference, or null, model.³⁵

We know, of course, that foreign aid donors are *not* indifferent to all factors other than the total magnitude of aid distributed among developing nations. By making this assumption, however, we can establish a benchmark against which to assess the actual distribution of aid by each donor. In effect, the transaction-flow model serves only to highlight greater than (or less than) expected aid flows.³⁶ Explaining deviations from the expected values is a separate task. For this purpose, a measure of voting agreements in the UN directly analogous to the aid RA indices is used.

Voting agreement indices. The first measure of the roll-call agreements between each donor and its aid recipients utilized is the percentage

³⁵ For a more complete discussion of the transaction-flow model, see Steven J. Brams, "Transaction Flows in the International System," *American Political Science Review*, 60 (December, 1966), 882-86; Steven J. Brams, "Trade in the North Atlantic Area: An Approach to the Analysis of Transformations in a System," *Peace Research Society Papers*, VI, Vienna Conference (1966), pp. 144-48; and E. Wittkopf, "The Concentration and Concordance of Foreign Aid Allocations." My thanks to Professor Brams for the considerable guidance and encouragement he lent to the application of the transaction-flow model and his computer program INDIFF to the data on foreign aid flows.

³⁶ The principal difference between the original Savage-Deutsch model and the Goodman-Brams modification is that the former excludes from the calculation of E_{ij} 's only a country's transactions with itself, while the latter excludes all pairs not actually linked by known transaction flows. In the case of the foreign aid data, three of the four logical portions of the square foreign aid matrix are, by definition, blank—recipient to recipient, recipient to donor, and donor to donor aid flows. With so many zero entries, it was necessary to assign an arbitrarily small value (equal to \$.01) to one cell within each row and column that would otherwise have been entirely blank in order to ensure calculation of E_{ij} 's for the actual non-blank cells.

of all roll-call votes taken in each of the Assemblies, with both the aid donor and recipient present and voting, on which both donor i and recipient j vote identically.³⁷ Abstentions as well as yeas and nays are included in the calculation. For each donor this variable is correlated with the absolute amount of foreign aid the donor allocates among its aid recipients.

The second measure of voting agreements employs a model developed by Steven J. Brams and Michael K. O'Leary for the comparative analysis of voting bodies.³⁸ Specifically, we will employ the Brams-O'Leary relative agreement index, defined as³⁹

$$VRA_{ij} = \frac{AG_{ij} - E(AG_{ij})}{E(AG_{ij})},$$

where

VRA_{ij} = the relative agreement between UN members i and j ,

AG_{ij} = the actual number of times members i and j agree across a set of roll calls, and

$E(AG_{ij})$ = the expected number of roll calls on which a randomly-selected pair of Assembly members, for all roll calls on which members i and j are both present and voting, agree.

The expected agreement between i and j , $E(AG_{ij})$, is defined as the sum of the probabilities of agreement between i and j , on each of the roll calls with both i and j present and voting, included in the set of roll calls analyzed. These probabilities are based on the actual distribution of yeas, nays, and abstentions in the General Assembly on each roll-call vote.⁴⁰

What the Brams-O'Leary model does is establish a statistical norm, based on the behavior of all members in the General Assembly, against which to measure the actual number of voting agreements between specified pairs of

³⁷ Todd uses this measure of voting agreements in his study of voting in the Security Council. James E. Todd, "An Analysis of Security Council Voting Behavior," *Western Political Quarterly*, 22 (March, 1969), 61-78.

³⁸ Steven J. Brams and Michael K. O'Leary, "An Axiomatic Model of Voting Bodies," *American Political Science Review*, 64 (June, 1970), 449-70.

³⁹ Brams and O'Leary, p. 463.

⁴⁰ Brams and O'Leary, pp. 452-53. The Brams-O'Leary model assumes that the voting behavior of legislative members is independent from one roll call to the next. It can be demonstrated, however, that the value of the expected term in the calculation of VRA is not dependent on the assumption of independence. See Lawrence S. Mayer, "A Note on 'An Axiomatic Model of Voting Bodies'," *American Political Science Review*, 65 (September, 1971), 764-65, and the response in Steven J. Brams and Michael K. O'Leary, "Comment on Mayer's 'A Note on 'An Axiomatic Model of Voting Bodies'"', *American Political Science Review*, 65 (September, 1971), 766-67.

members. Like the pairwise measure discussed earlier, the *VRA* index also expresses agreement between two actors in percentage terms. The VRA_{ij} percentages, however, measure deviations from zero, the point at which *i* and *j* agree exactly as often as would be expected on the basis of the behavior of all members in the Assembly.⁴¹

In fact, for each donor country in both General Assemblies analyzed there is almost 100 per cent covariation between the percentage of pairwise agreements measure and the *VRA* index. Operationally, this means it makes virtually no difference which agreement variable is used in the correlation analyses.⁴² However, because the *VRA* index is conceptually analogous to the foreign aid relative allocation indices used as one of the foreign aid variables, the *VRA* index will be retained as the agreement measure when the aid *RA* indices are also used.

In addition, the Brams-O'Leary relative agreement index also provides a technique for assessing the difference in the level of agreements between each aid donor and its aid recipients and nonrecipients—the “between group” differences discussed earlier. Group relative agreement scores are defined as⁴³

$$VRA_{IJ} = \frac{\sum_{i,j} A_{ij} - \sum_{i,j} E_{ij}}{\sum_{i,j} E_{ij}},$$

where

VRA_{IJ} = the relative agreement of member subsets *I* and *J*,

A_{ij} = the actual number of agreements between members *i* and *j*, with the summations ranging over all individual members *i* and *j* belonging to the (disjoint) subsets *I* and *J*, and

E_{ij} = the expected number of agreements between members *i* and *j*, with the summations ranging over all individual members *i* and *j* belonging to the (disjoint) subsets *I* and *J*.

For the purpose of this analysis, subset *I* always refers, with the exception of the analysis

⁴¹ Conceptually, the *VRA*'s are virtually identical with the aid *RA*'s. The two indices differ only in the calculation of the expected term; as indicated, the expected values for the aid *RA*'s depend on the row and column marginal totals in the aid matrix, while the expected values for the *VRA*'s depend upon the probabilities of agreement between a randomly-selected pair of Assembly members across a set of roll-call votes.

⁴² Substantively, this means that the patterns of agreements between particular pairs of states are not affected by the overall divisions in the Assembly. See Brams and O'Leary, “An Axiomatic Model of Voting Bodies,” p. 463.

⁴³ Brams and O'Leary, p. 464.

for the Soviet bloc, to an individual UN member, namely, foreign aid donor *i*. For each *I* subset, two *J* subsets are defined, one which includes all UN members that receive foreign aid from the *i*th donor, the other which includes all UN members that are *potential candidates* for foreign aid but do not receive aid from the *i*th donor. For the Soviet bloc, subset *I* refers to the Soviet Union and all Eastern European nations previously identified as aid donors.⁴⁴

The concept *potential candidates* for foreign aid was operationalized as follows. It seems intuitively unreasonable to include such countries as the United States, the Soviet Union, Canada, the United Kingdom, South Africa, and other similar states in the calculation of group *VRA* scores for nonrecipients of aid. Similarly, in none of the data collected for purposes of the present study, including data on Soviet bloc commitments, were receipts of foreign aid by Eastern European or Asian Communist nations reported. Therefore, in calculating group *VRA* scores for each donor country *i*, nonrecipients of foreign aid were defined as those UN members that received foreign aid in one or more forms from one or more of the *other* donors, whether a DAC donor or the Soviet bloc.

Given the stability over time in the relationship between aid and voting demonstrated in the correlation analyses presented below, group *VRA* scores were calculated only for the years 1963 and 1966. According to the definition elaborated in the preceding paragraph, 80 of the 113 members of the United Nations in 1963 were defined as potential recipients of foreign aid in that year; of the 122 members of the United Nations in 1966, 90 were defined as potential recipients of foreign aid in that year.⁴⁵

Findings

Percentage of pairwise agreements and absolute amounts of foreign aid. The results of the analyses of each donor's aid measured in absolute terms and the percentage of pairwise agreements in the 1963 and 1966 General Assemblies, displayed in Table 2, are indeed striking. Although in certain cases, such as the results for the United States based on the 1963 Assembly, there is a positive association between the

⁴⁴ As a practical matter it would make virtually no difference if subset *I* were defined to include only the Soviet Union, since the U.S.S.R. and its Eastern European allies exhibit almost identical behavior in their UN voting patterns.

⁴⁵ Developing nations making net repayments of aid (i.e., negative aid recipients) to a particular donor, as well as those that missed more than 40 per cent of the UN roll calls, were subtracted from these numbers for purposes of calculating group *VRA*'s for that donor.

relations indicates a significant relationship between the variables in the hypothesized positive direction. Indeed, the only significant associations are the inverse ones for Norway and the United Kingdom in 1967. Moreover, the overwhelming majority of the correlations, including those for the United States based on the 1966 Assembly, point toward an inverse relationship between foreign aid and UN votes for virtually all aid donors. The number of statistically significant negative correlations is admittedly small. But substantively, the overall pattern of the results, far from being consistent with the hypothesized relationship between aid and votes, suggests that most foreign aid donors are prone to reward their enemies rather than their friends. We will return to this inference in the discussion of the correlations between the voting and foreign aid *RA*'s.

Voting relative agreement and foreign aid relative allocation indices. The results of the analyses using the *VRA* and aid *RA* indices are displayed in Tables 3-5. Looking first at the correlations for the United States (Table 3), we can see that there is a dramatic change from the patterns summarized in Table 2.⁴⁷ All of

the correlations for both Assembly sessions now indicate a positive association between aid and votes. Further, when statistical significance is used to assess the strength of the associations, all of the correlations fit the hypothesis that the larger the (relative) number of voting agreements exhibited by a developing nation with the United States, the greater will be the (relative) amount of aid received by that state from the U.S.

At the same time, however, it is also true that in terms of shared variance none of the correlations is overwhelming in magnitude. In the case of the 1962 aid *RA*'s and the 1963 *VRA*'s, for example, less than 10 per cent of the variation in one variable is explained by the other, while in the case of the largest correlations in the table, those for 1964, only between 20 and 26 per cent of the variation is thus explained.⁴⁸ In addition, the results provide little

from those shown in Table 2 can be attributed largely to the transaction-flow model, which, in effect, "transforms" the aid data by adjusting for the size of aid recipients assumed to be reflected in the relative magnitudes of foreign aid transactions between donors and recipients. The magnitude of foreign aid transactions may also indicate the importance of recipients to donors, but this will be reflected in the aid *RA*'s only if the foreign aid transactions for a particular donor are greater than what would be expected on the basis of the proportionate distribution of transactions of all aid donors included in the system analyzed. Essentially, then, the indifference model is an alternative to the more usual ways of "normalizing" foreign aid data, such as by the population size, GNP, or imports of developing nations. Interestingly, in the analysis of U.S. aid and developing nations' voting behavior on the China issue cited earlier (footnote 19), an aid/imports ratio was used as one of the foreign aid variables, but the results were virtually identical to those obtained when only the absolute amounts of aid dollars were used.

⁴⁸ These generally low levels of shared variance are perhaps not surprising given the large number of both political and development considerations presumed to undergrid U.S. aid allocations. For a discussion and empirical analysis of some of these additional con-

tude of the relationship between two variables is due to chance. (Robert F. Winch and Donald T. Campbell, "Proof? No. Evidence? Yes. The Significance of Tests of Significance," *The American Sociologist*, 4 [May, 1969], 143). Cf. Bruce M. Russett et al., *World Handbook of Political and Social Indicators* (New Haven: Yale University Press, 1964), p. 263; and J. David Singer and Michael Wallace, "Intergovernmental Organization and the Preservation of Peace, 1816-1964: Some Bivariate Relationships," *International Organization*, 24 (Summer, 1970), 533. Significance tests are also particularly useful in situations where there are large variations in the number of observations, as is the case here, which otherwise would make comparisons across foreign policy actors very difficult.

⁴⁷ Because the percentage of pairwise voting agreements and the *VRA*'s are very highly correlated, as noted earlier, the change in the results for the U.S.

Figure 1. Relationship Between United States Total Aid Relative Allocation Indices, 1964, and General Assembly Roll-Call Relative Agreement Scores with the United States, 1963

basis for drawing an inferential distinction between the use of aid as an inducement to future behavior and its use as a reward (or punishment) for past behavior in the UN. True, in both Assemblies the relationship between aid in year $t + 1$ and voting agreements in year t is moderately stronger than in those cases in which the aid data precede the voting data. But the differences are not striking in either Assembly. All we can safely say at this point is that there is a moderately strong, statistically significant association between the relative allocation of U.S. foreign aid and the relative number of voting agreements between the U.S. and its aid recipients in the General Assembly.

siderations, see E. Wittkopf, "The Concentration and Concordance of Foreign Aid Allocations," and E. Wittkopf, *Western Bilateral Aid Allocations: A Comparative Study of Recipient State Attributes and Aid Received* (Beverly Hills, Calif.: Sage Publications, 1972).

Are these results for the United States simply due to a small number of extreme cases? In general, the answer appears to be no. Scatter diagrams for two of the strongest associations in Table 3, those for 1964 and 1967 (excluding Soviet bloc commitments), are displayed in Figures 1 and 2.⁴⁰ The diagram for 1964 (Figure 1) does suggest that the extreme cases of Chile, Brazil, Turkey, and Greece make a substantial contribution to the moderately strong, positive association between aid and votes. At the same time, however, the relatively large concentration of Latin American states, plus Taiwan, Liberia, Thailand, and the Philippines in the upper right-hand quadrant of the diagram, and in addition, the large number of Af-

⁴⁰ Nations are identified according to their abbreviated names given in Table 1. The reader is cautioned to note that the axes in the two scattergrams are not identical. This is also true for Figure 3 shown on p. 884.

Figure 2. Relationship Between United States Total Aid Relative Allocation Indices, 1967, and General Assembly Roll-Call Relative Agreement Scores with the United States, 1966

rican states (those which derive the bulk of their aid from Britain and France) in the lower left-hand portion of the diagram together point toward a positive association between aid and votes across a large range of developing nations. Similarly, in 1967 (Figure 2) the pattern of a large number of Latin American nations in the upper right-hand portion of the graph and a large number of African nations in the lower left-hand portion again accounts for the positive association between aid and votes. An interesting feature of both diagrams, one most apparent in 1967, is the large number of Asian and Arab nations in the upper left-hand portion of the diagram. If the hypothesis were correct that aid motivates voting behavior, or vice versa, then we would expect either: (1) that these states would agree more often with the United States than they in fact did, or (2) that the U.S. would not allocate as much relative aid to these nations as it actually did. Because

neither of these outcomes is reflected in the diagram, U.S. behavior in these instances was probably motivated by other factors, such as political or security considerations in the case of the Asian nations, and perhaps the desire to maintain some semblance of political influence in the region in the case of the Middle Eastern nations. Similarly, the results suggest that factors other than U.S. aid, such as anti-Israeli or anticolonial sentiments, are more important explanations of the recipients' political behavior in the UN.

How do these findings for the United States compare with those for other aid donors? The results shown in Tables 4 and 5 clearly indicate that, in contrast to the United States, for most donors use of the aid *RA* and *VRA* indices does not yield results dramatically different from those displayed in Table 2. Judging by the signs of the coefficients, a somewhat smaller proportion of the correlations is consistent with

Correlation coefficients significant at the .05 level are indicated by an asterisk (*).

^b Correlations between the relative agreement scores of each aid recipient with the Soviet Union and foreign aid relative allocation indices for commitments of economic assistance from the Soviet bloc.

the hypothesized positive association between aid and votes in the 1963 Assembly, and a somewhat greater proportion is consistent with the hypothesis in the 1966 Assembly. Of the 51 correlations calculated on the basis of the 1963 voting data (including those for the U.S.), 35 per cent are in the predicted positive direction (compared with 48 per cent in Table 2); of the 81 correlations based on the 1966 voting data, 36 per cent are in the predicted direction (compared with 7 per cent in Table 2). The positive correlations, however, are statistically significant for only four donors—Austria (1964), Canada (1963), Australia (1966, including Soviet bloc aid commitments), and the Soviet bloc (1964). And for none of these donors is the relationship consistently strong over time, as it is for the United States. Thus the overall

pattern of either a negative or a weak positive association between aid and votes remains.

Turning to the question of the use of aid as an inducement or as a reward, we can note that like the results for the United States, the results for most other donors fail to support any inferences about these two conceptually distinct uses of foreign aid. The case that appears to be an exception is the Soviet bloc, for which the correlations based on the 1963 voting data might be interpreted as indicating the use of aid as a reward. However, this pattern is not repeated in the 1966 Assembly, and the small number of cases for each correlation would in any event make such an inference suspect. Further, given the generally small number of cases, the correlations can be especially sensitive to extreme data points, a fact which appears to account for

^b Correlations between the relative agreement scores of each aid recipient with the Soviet Union and foreign aid relative allocation indices for commitments of economic assistance from the Soviet bloc.

the unusually high correlation for 1964. Finally, it bears repeating that since the Soviet data are commitments rather than disbursements, the Soviet bloc aid RA's are considerably more disparate than would probably be the case if the Soviet data measured the actual amount of resources flowing from the Soviet bloc to developing nations (as do the data for the DAC donors).

It is interesting that a shift in the geographic location of Soviet aid recipients beginning in 1965 appears to account for the negative (but not significant) correlations for the Soviet bloc based on the 1966 voting data. Prior to 1965 Soviet commitments were extended only to Asian and African developing nations, but beginning in that year Soviet aid commitments to European and Latin American nations are re-

ported as well.⁵⁰ The magnitudes of the Soviet aid commitments to these nations have usually yielded relatively high aid *RA*'s. Moreover, these nations have traditionally been more pro-Western in their UN voting behavior than have most Asian and African developing nations. Therefore, the resulting upward pull on the correlation coefficients suggests that, in simple linear terms, the Soviet bloc too tends to reward its Assembly enemies more than its friends. This is particularly apparent in 1967, for which a scattergram indicates that the generally high positive aid *RA*'s of Turkey, Uruguay, and Chile coupled with their negative *VRA*'s with the Soviet bloc make a substantial contribution to the *r* of $-.42$.

These results for the Soviet bloc raise the question of whether similar patterns in the aid allocations of other donors can be used to explain the large number of negative correlations shown in Tables 4–5. Scatter diagrams of the statistically significant negative correlations for Italy and Norway based on the 1966 voting data do suggest that a relatively small number of cases (particularly for Norway) contribute heavily to the negative associations. Again the substantive interpretation would seem to be that enemies are rewarded more than friends. Put differently, the relative amount of aid these nations have received from the respective donors has had little impact on their propensity to vote with the donor in the UN, or, conversely, the position these nations have taken on the range of issues before the UN vis-à-vis each donor has had relatively little impact on the allocation of aid by the donor. Particularly important in this respect seems to be the position on decolonization and related issues taken in the UN by a number of developing nations, notably in Asia and Africa.⁵¹ This is especially apparent for France, for which the correlations based on the 1963 Assembly indicate a strong inverse association between aid and votes.

The position France's former African colonies have taken on many UN issues in opposition to France is reflected in their high negative

VRA's with their former ruler. At the same time, however, these nations receive the largest proportion of their aid from France and therefore have correspondingly high aid *RA*'s. In contrast to these African states, some recipients of French foreign aid, notably those in Europe and Latin America, are among those developing nations least prone to disagree with Western states on decolonization and related UN issues.⁵² Given the proportionately larger share of aid received by these states from the United States, however, the aid *RA*'s of France's European and Latin American aid recipients tend to be much lower than the *RA*'s of the African states. Consequently, a line fitted through these data points shows that aid and voting agreements are inversely rather than positively associated.

The interaction of these factors is illustrated in the scatter diagrams of the relationship between the 1964 aid *RA*'s (excluding Soviet bloc commitments) and the 1963 *VRA*'s for France and the United States displayed in Figures 3 and 1, respectively. It is readily apparent from the diagram for France (Figure 3) that the inclusion of Chile, Brazil, Greece, and Turkey accounts for the high negative correlation between the two variables ($r = -.61$). With the exception of Madagascar, none of France's former African colonies agreed more often with France (in relative terms) than did these four non-African aid recipients. At the same time, none of these four nations received as much foreign aid from France (in relative terms) as did France's former African colonies. In fact, the aid *RA*'s are less than an indifferent amount (i.e., less than zero), partly because these nations received a relatively large proportion of the foreign aid disbursed by the United States. This fact is vividly illustrated in the scatter diagram for the U.S. (Figure 1).

Again, then, we are faced with the temptation to argue that France (like other donors) is prone to reward its enemies more than its friends.⁵³ There are alternatives, however. On

⁵⁰ Estimates of Soviet bloc aid commitments in millions in U.S. dollars to European and Latin American developing nations are as follows:

	1965	1966	1967		1965	1966	1967
ARGE	15			ECUA			5
BRAZ		128		GREE	84		
CHIL			55	TURK	200		200
				URUG			10

⁵¹ For a discussion of decolonization issues, with special reference to African states, see David A. Kay, *The New Nations in the United Nations, 1960–1967* (New York: Columbia University Press, 1970), pp. 80–85.

⁵² Kay, p. 84.

⁵³ In a separate analysis of the two basic component categories of foreign aid, grants and gross official loans, it was found that there is a positive (but not significant) relationship between France's *VRA*'s and aid *RA*'s when the latter are calculated only on the basis of grants, and a negative relationship similar to those shown in Tables 4 and 5 when the aid *RA*'s are calculated on the basis of gross loans. The reason lies in the fact that France chose not to allocate grants to its European and Latin American aid recipients, thus excluding those nations most prone to agree with her in the UN as the above results indicate. For details, see E. Wittkopf, "The Distribution of Foreign Aid in Comparative Perspective," pp. 124–33.

Figure 3. Relationship Between French Total Aid Relative Allocation Indices, 1964, and General Assembly Roll-Call Relative Agreement Scores with France, 1963

the one hand, it could be argued that "matters could be worse." This is very close to the notion suggested by Mason when he observes that "[d]iplomats are frequently worried by voting records in the United Nations and suggest that an increase in aid to their particular country would improve this record."⁵⁴ The implication of this argument is that aid does serve, at least minimally, as a form of influence by moderating the positions of developing nations in the UN; that without this aid, frequently high in relative terms, the positions of aid recipients would be even more antidonor (meaning in most cases anti-Western) than they already are.⁵⁵ The corollary of this notion is that those

states that appear generally more prodonor in terms of their voting preferences can be considered "safe."

On the other hand, it could also be argued that a large number of considerations and motivations undergird the aid programs of developed nations, of which the international political behavior of aid recipients in the UN is only one. Similarly, the UN voting behavior of developing nations is also conditioned by domestic as well as international political considerations other than those concerning foreign aid. Therefore we should not be surprised by the generally weak, albeit inverse, association between voting agreements and aid allocations observed for most donors. What this argument implies, of course, is the need for multivariate analysis of both voting preferences and aid allocations. But it also suggests that insofar as we can generalize from the present data and meth-

⁵⁴ Mason, p. 33.

⁵⁵ As Benjamin J. Cohen has put it in discussing the rationale for a U.S. development aid program, "In at least one fundamental respect . . . the promotion of the growth of poor countries is in our national interest: economic concessions on our part serve as a kind of insurance against belligerency on the part of the less developed countries" ("The Third World: The Issues," in *American Foreign Economic Policy*, ed.

Benjamin C. Cohen [New York: Harper and Row, 1968], p. 339).

odology, the preferable substantive interpretation of the findings seems to be that in terms of their allocation of foreign aid most donor countries are indifferent to the roll-call voting behavior of developing nations in the United Nations.⁵⁶ The reason for this may well be quite simple—the types of foreign policy positions and behavior represented by UN roll calls may be largely irrelevant to the central concerns of decision-making elites dealing with foreign aid allocations.

The exception to this generalization is the United States. Even here, however, care must be used. The fact that the results for the United States were found to be statistically significant might lead one to conclude that foreign aid is indeed used as an instrument of influence in the UN. But this is far from conclusive. It may be that the results reflect little more than the co-occurrence of two indicators of states' general foreign policy orientations, which means the question of a causal link between the indicators remains largely unanswered. Even in the case of the United States, then, additional and alternative lines of inquiry are in order.

Between-group differences. The final question to be addressed is whether the exclusion of nonrecipients of aid for each donor is in part responsible for the results discussed above. For this purpose, group *VRA* scores have been calculated for each donor's set of recipients and nonrecipients of aid in 1963 and 1966. The results of the analyses are displayed in Table 6.

Looking first at the United States, we see

⁵⁶ This conclusion must, of course, be used advisedly. From the perspective of aid donors, what is being said is if foreign aid donors are motivated to allocate their aid on the basis of how developing nations vote in the UN, then we would expect to find patterns of association different from those found for most donors. The United Kingdom is an illustrative case similar to France. In 1964, Kenya, Tanzania, and Uganda had among the highest aid *RA*'s of any British aid recipient. These states were also among those least prone to agree with Britain in the 1963 General Assembly. The result is an inverse association. If, however, a primary consideration was how these nations voted in the UN vis-à-vis the United Kingdom, then we would expect that Britain would not have allocated as much of its aid proportionately to these nations as it in fact did. Although it is generally the case that developing nations agree with most aid donors (notably DAC donors) relatively infrequently (i.e., virtually all DAC donors' *VRA*'s are negative), clearly some developing nations among those that Britain chose to aid in 1964 agreed relatively more often with the United Kingdom than either Kenya, Tanzania, or Uganda. Accordingly, our hypothesized relationship between aid and votes suggests that these other states should have received a relatively greater amount of British aid than they did.

that in 1963, the 68 recipients of U.S. aid as a group agreed with the United States 34 per cent less often than would be expected on the basis of the behavior of all members of the General Assembly. In comparison, the three nonrecipients agreed, as a group, 38 per cent less often than would be expected. In 1966, the corresponding group *VRA*'s indicate that the 71 recipients of U.S. aid agreed with the United States 34 per cent less often than would be expected, while the four nonrecipients agreed 59 per cent less often than would be expected.

If the hypothesis is correct that the exclusion of nonrecipients of aid results in a stronger relationship between aid allocations and voting agreements than would otherwise be the case, then we would expect the group *VRA* scores of the aid recipients to be substantially higher than the group *VRA*'s of the nonrecipients. In general, however, this is not the case. The difference of twenty-five percentage points between the recipients and nonrecipients of U.S. aid in 1966 is the largest difference (in the predicted direction) between the two percentages for any donor. But the number of nonrecipients is so small as to make this difference between the groups of questionable substantive interest. Other than the United States, the only differences approximating the same magnitude are those for Belgium and the Soviet bloc in 1966. In the case of the Soviet bloc the number of nations comprising the recipient group is so small as again to cast doubt upon the substantive meaning of the differences between the two groups.⁵⁷

For many of the remaining donors the difference between the two group *VRA*'s is slight; in fact, in ten of the remaining twenty cases the difference is less than six percentage points. Moreover, in half of all the cases based on the 1966 data, and in just under half of the cases based on 1963, the relative agreement scores of the group receiving aid from the donor are in fact less than the *VRA*'s for the nonrecipients. In general, then, exclusion of the nonrecipients of aid for each donor does not appear to qualify significantly the findings regarding the association—or lack of it—between the allocation of foreign aid and patterns of agreement in General Assembly voting. “Between-group” differences, in other words, do not appear to be more important than “within-group” differ-

⁵⁷ Because the Soviet bloc data are commitments rather than disbursements, this is the one donor for which group *VRA*'s could show more than minimal fluctuations from one year to the next if they were calculated for all six years included in the study.

Table 6. General Assembly Group Relative Agreement Scores of Developing Nations Receiving and Not Receiving Foreign Aid, 1963 and 1966^a

(Number of nations in each group shown in parentheses)

Donor Country	1963		1966	
	Group receiving total aid from donor	Group not receiving total aid from donor	Group receiving total aid from donor	Group not receiving total aid from donor
Australia	NA	NA	-35 (20)	-25 (58)
Austria	03 (16)	-06 (43)	-15 (32)	-21 (32)
Belgium	—	—	-21 (26)	-35 (52)
Canada	-17 (27)	-16 (47)	-26 (45)	-15 (29)
Denmark	—	—	-16 (25)	-14 (53)
France	-58 (20)	-50 (53)	-41 (26)	-42 (49)
Italy	-06 (20)	-16 (45)	-25 (44)	-21 (21)

United States	-34 (68)	-38 (3)	-34 (71)	-59 (4)
Soviet bloc ^b	-02 (8)	-17 (66)	21 (12)	00 (66)

^a Recipients of negative foreign aid and recipients that missed more than 40 per cent of the Assembly roll calls are excluded. A dash indicates that the group receiving aid comprises less than eight Assembly members. NA indicates that foreign aid data are not available.

^b Soviet bloc members are Bulgaria, Czechoslovakia, Hungary, Poland and the Soviet Union in 1963; and Bulgaria, Czechoslovakia, Hungary, Poland, Rumania, and the Soviet Union in 1966.

ences in terms of roll-call agreements between developing nations and foreign aid donors.

Summary and Conclusion

A striking feature of the analysis is that the hypothesized association between aid and votes was found to hold only for the United States, and only in that portion of the analysis using deviations from idealized norms as the operational measures of aid allocations and voting agreements. Although positive associations were discerned for other donors as well, such as the Soviet bloc in 1964, for no aid donor other than the U.S. was the association found to be consistently strong over time. In some respects, then, the results support Keohane's observation that the use of extra-parliamentary instruments of influence in the United Nations is confined almost exclusively to the United States and the Soviet Union.⁵⁸ This appears to be the case even though for other donor countries (notably Britain and France vis-à-vis their former colonies) foreign aid is clearly part of a general dependency relationship between developed and developing nations. Apparently, then, the voting behavior of developing nations is largely irrelevant to the concerns of most foreign aid donors.

Even in the relationship between aid allocations and voting behavior observed for the United States, it is unclear which of the two variables should be considered a cause and which a consequence. With the possible exception of the analyses of Soviet bloc aid commitments, most of the results based on a lagged relationship between the variables examined have failed to point toward significantly different relationships between aid and votes within either of the two three-year periods analyzed.

Certainly the association between aid and votes is sufficiently strong in the case of the United States to warrant further research into the exact nature of the causal nexus—if, indeed, it exists at all. As suggested above, multivariate analysis would be a logical next step. Alternatively, longitudinal rather than cross-national analysis of some selected subset of developing nations might be pursued. Or one might attempt to measure the perceptions that UN participants have of the use of aid as influence. Whatever the particular strategy pursued, from the viewpoint of the student of international organization the results for the United

States do suggest that continued examination of the extraorganizational links between UN members may prove useful in describing and explaining the outcomes of the political processes in the United Nations.

A word of caution is in order, however. Although the results do show a statistically significant positive association, neither 10 per cent nor even 25 per cent covariation is sufficiently large to lead one to believe that extraorganizational links alone will suffice to explain organizational politics. Indeed, another researcher viewing these results may find here a case for directing greater attention to intraorganizational processes and influence patterns in an effort to explain political outcomes.⁵⁹ There is merit in this position.

Similarly, the foreign policy analyst could interpret the results for the United States as suggesting the need for continued examination of the impact of external variables on foreign policy outputs, for both developed and developing nations. When we move beyond the United States, however, the results also suggest that external variables—at least insofar as they are tapped in this study—may well be insufficient explanations of foreign policy behavior; that we may have to examine role, governmental, and societal variables⁶⁰ as well in order to explain foreign policy outcomes.

Should there be a relationship between foreign aid and United Nations votes? A dual interpretation of the findings can also be made by those interested in this normative question. Those who prefer that "appreciation" for foreign aid be reflected in the United Nations will find little solace in the generally moderate levels of association between aid and votes. Conversely, those who subscribe to the opposite view may well find discomfort in the fact that there is *any* association whatsoever between the variables, particularly considering that the association appears to be confined almost exclusively to the United States. Which perspective is adopted probably depends on one's view of

⁵⁸ The utility of examining intraorganizational processes is demonstrated in Chadwick F. Alger, "Interaction in a Committee of the United Nations General Assembly," in *Quantitative International Politics*, ed. J. David Singer (New York: The Free Press, 1968), pp. 51-84; and Kathleen Maas Weigert and Robert E. Riggs, "Africa and United Nations Elections: An Aggregate Data Analysis," *International Organization*, 23 (Winter, 1969), 1-19.

⁵⁹ The potential impact of these factors on foreign policy is discussed in James N. Rosenau, "Pre-theories and Theories of Foreign Policy," in *Approaches to Comparative and International Politics*, ed. R. Barry Farrell (Evanston, Ill.: Northwestern University Press, 1966), pp. 27-92.

⁶⁰ Because the Soviet bloc and DAC data do differ in kind, it seems reasonable to tentatively regard the absence of comparable results for the United States and the Soviet bloc (a surrogate for the Soviet Union) as at least partially attributable to the absence of comparable data.

the role of foreign aid as an instrument of influence and the role of the United Nations as an instrument of conflict management and resolution. One perspective is represented by Kaplan's normative position that "... the United States should not seek to starve a poor country into support for its foreign policy. An incentive system cannot operate in the case of every vote in the United Nations or every meeting of de-

veloping nations."⁶¹ The other perspective is represented by Westwood: "It seems likely that one of the major questions for the future is whether aid should not be included within the broad process of give and take on concrete issues which produces cooperation among mature, independent, and equal nations."⁶²

Democratic Committee Assignments in the House of Representatives: Strategic Aspects of a Social Choice Process*

DAVID W. ROHDE

Michigan State University

KENNETH A. SHEPSLE

Washington University, St. Louis

Since Woodrow Wilson wrote *Congressional Government*, the dominance of the standing committees in the House of Representatives in determining legislative outcomes has been accepted by students of Congress. In light of recent studies of groups of House committees¹ and in-depth studies of individual committees,² the generalization about the central role of committees in the legislative process remains intact. These studies, however, indicate that there are major differences among these "little legislatures" in regard to their organization and behavior, and that these differences are in part a function of differences in their memberships. Furthermore, as Charles Clapp has said,

Not only is the fate of most legislative proposals determined in committee: to an important degree the fate of individual congressmen may be decided there too. A person's congressional career may rest largely on the kind of committee post he is given.³

Therefore, given the importance of committee membership, both in policy making and in

determining the success of individual congressmen's careers, the process by which members are assigned to committees is of the greatest importance.

A good deal of research has been devoted to the committee assignment process in the House.⁴ Most of this research, however, has been based on the *results* of the process, i.e., the committee assignments that were actually made. For example, the desirability of committees has been measured in terms of the proportion of the freshmen on each committee, or the number of transfers from a committee versus the number of transfers to it. The variable missing from such treatments has been the desires of the members. Also, success in achieving committee assignments has been treated in only the most general terms, again because of the absence of data on what committees members requested.

The purpose of this paper is to analyze committee assignments by focusing on this "missing link." Our subject will be the committee assignments of Democratic members of the House of Representatives. Committee assignments, as Clapp's observation above suggests, are valued, are in limited supply, and are allocated by

* We would like to express our gratitude to Richard Fenno of the University of Rochester and John Manley of Stanford University for making available to us the request data for the 87th, 88th, and 90th Congresses, and to Robert Salisbury of Washington University, St. Louis, for the request data from the 86th Congress. We also wish to acknowledge the research assistance of Robert Delgrosso of Michigan State University. We finally want to thank Richard Fenno, Morris Fiorina of the California Institute of Technology, and the two anonymous referees for their helpful comments on previous versions of this study. An earlier draft of this paper was presented at the 67th Annual Meeting of the American Political Science Association, Chicago, September 7-11, 1971.

¹ Richard F. Fenno, Jr., "Congressional Committees: A Comparative View," a paper presented at the 66th Annual Meeting of the American Political Science Association, Los Angeles, September 8-11, 1970; George Goodwin, Jr., *The Little Legislatures* (Amherst: University of Massachusetts Press, 1970).

² Richard F. Fenno, Jr., *The Power of the Purse: Appropriations Politics in Congress* (Boston: Little, Brown and Co., 1966); John Manley, *The Politics of Finance: The House Committee on Ways and Means* (Boston: Little, Brown and Co., 1970).

³ *The Congressman: His Work as He Sees It* (New York: Doubleday and Co., 1963), p. 207.

⁴ The classic treatment of the process is Nicholas A. Masters, "Committee Assignments in the House of Representatives," *American Political Science Review*, 55 (June, 1961), 345-357. Assignments are discussed at length in Clapp, *The Congressman*, pp. 207-240, and Goodwin, *The Little Legislatures*, pp. 64-79. Some recent studies include Louis C. Gawthrop, "Changing Membership Patterns in House Committees," *American Political Science Review*, 60 (June, 1966), 366-373; Charles Bullock and John Sprague, "A Research Note on the Committee Reassignments of Southern Democratic Congressmen," *Journal of Politics*, 31 (May, 1969), 493-512; Charles Bullock, "Correlates of Committee Transfers in the United States House of Representatives," a paper delivered at the Annual Meeting of the Midwest Political Science Association, Chicago, April 29-May 1, 1971; Charles Bullock, "The Influence of State Party Delegations on House Committee Assignments," *Midwest Journal of Political Science*, 15 (August, 1971), 525-546; and Charles Bullock, "Freshman Committee Assignments and Re-election in the United States House of Representatives," *American Political Science Review*, 66 (September, 1972), 996-1007.

rather well-defined mechanisms and procedures. By viewing committee assignments as the culmination of a special sort of allocation process, we shall be in a position to *explain* the results of this process, the *descriptions* of which have constituted the bulk of research on this topic to date. It is explanations we seek, and we find more general theories of social choice particularly well-suited for this purpose. More specifically, we examine the data of committee assignments in terms of actors in pursuit of personal goals, constrained only by scarcity and institutional procedures. We will consider the process from the point of view of the members requesting assignment and the members who make the assignments: who wants what committees, and whose requests are satisfied. The basic data which will be employed are the requests for committee assignments, by all House Democrats, made to the Democratic Committee on Committees in the 86th-88th and 90th Congresses.

Democratic Committee Assignments⁵

In the House, the Democratic Committee on Committees is made up of the Democratic members of the Ways and Means Committee.⁶ At the beginning of each Congress they are faced with the task of filling vacancies on the other standing committees of the House. Each member of the Committee is assigned a geographic zone, containing his own state and perhaps others, and he is responsible for handling requests for assignments from members in his zone.⁷

Some time after the November election, new Democratic congressmen submit to the Committee on Committees their requests, in order of preference, for committee assignments. At

the same time, returning congressmen may submit requests for second assignments or for transfers from committees they held in the previous Congress.

After members submit requests, lobbying for assignments begins. Many representatives seeking assignments write letters to some or all members of the Committee on Committees, setting forth arguments on their own behalf. Many also pay personal visits to the members of the Committee (especially their zone representative), to the Democratic leaders, and to the chairmen of the committees they are requesting. Often letters are written to members of the Committee on Committees to support the cause of some requesters. Typically these letters came from the deans of state delegations (either from themselves alone or on behalf of the whole delegation), from party leaders or office-holders outside the House, from committee chairmen and from leaders of interest groups relevant to the work of the committees requested.

At the beginning of the Congress, the size of committees as well as party ratios are set by negotiation between the leaders of both parties.⁸ Thus the members of the Committee on Committees are faced with the task of filling the vacancies on the standing committees which have resulted either from the failure of some Democratic members to return or from the creation of new positions. The Committee meets in executive session, and each of the committees is called up (usually alphabetically). For each committee the members proceed in order of seniority to nominate candidates from their zone.⁹ The names of nominees are written on a blackboard, and they are discussed by the members. After nominations are completed, the members vote by secret ballot.

Finally, after the Committee on Committees has filled all the vacancies, their decisions are placed before the Democratic Caucus for ratification. This is, however, almost always a *pro forma* action.

For our purposes, then, the time sequence of the committee assignment process, which culminates in the creation of a committee structure for a new Congress, may be characterized by the following stages:

⁵ While party ratios usually reflect the partisan division in the House, it is not unlikely that the decisions on both these questions are influenced by the leadership's knowledge of the requests of the members of their party.

⁹ It is important to note that the only way a requester can be nominated for a committee post is to be nominated by his zone representative.

⁵ In addition to our own data, this description relies heavily on Masters, "Committee Assignments," and on Clapp, *The Congressman*, Chapter 5.

⁶ The Democratic delegation on Ways and Means is made up almost entirely of members drawn from the South and Border States and from the large industrial states. They are elected to membership by a vote of the full Democratic caucus. During the period covered by this study the committee was dominated by the Southern and Border State group, who were greatly over-represented compared to their proportion of the Democratic delegation in the House. In the 86th-88th Congresses, they had 8 members out of the total of 15, and in the 90th Congress they had 7 of 15. For a discussion of assignments to Ways and Means, see Manley, *Politics of Finance*, pp. 22-38.

⁷ Zone assignments in the 86th Congress are listed in Masters, "Committee Assignments," p. 347. The number of states represented varies greatly, with Keogh of New York, for example, representing only his own state, while Metcalf of Montana represents seven small Western and Midwestern states.

(1) the committee configuration in the previous Congress;

(2) an election;

(3) requests for assignments by newly elected members and by returning members who held assignments in the committee configuration of the previous Congress;

(4) the establishment of size and party ratios for committees in the new Congress;

(5) committee assignments by the Democratic Committee on Committees for the new Congress.

Stage 1 provides initial conditions which are "disturbed" by an election (stage 2). The election disturbs the initial committee structure in several obvious ways. First aggregate party proportions in the chamber are altered, requiring the renegotiation of the committee structure by party leaders: committee sizes and party ratios are fixed at this stage (stage 4). Second, individual and aggregate election results effect a change in the opportunity structure in the chamber. Individual defeats of party members in the election create party committee vacancies (which may or may not be lost to the party depending on the aggregate election results and its effect on stage 4). At the outset of the new Congress, then, there are unfilled committee vacancies and demand for those slots by newly elected and returning members (as expressed at stage 3).

Our concern in this paper is with the process of committee assignments for the Democrats. We take the first, second and fourth stages of the process as exogenous to our concerns (though, as we suggested earlier, stage 4 may well be conceived as as endogenous, since it is probable that deviations from the aggregate party ratio on any given committee are partly a result of the configuration of requests at stage 3). Before getting into the details of our analysis, we should first outline the general theoretical context within which we view the requests of the members and the decisions of the Committee on Committees.

Member Goals and Committee Assignments

As the title of this paper implies, we view the committee assignment process as an instance of "social choice" (or "collective decision making"). That is, a group (the Committee on Committees) is charged with allocating the valuable resources (places on committees) of the collectivity (the Democratic members of the House). We view the participants in the process as rational actors, that is, actors who have goals that they want to achieve, and who, when confronted with a decision-making situa-

tion, examine the available alternatives and choose the alternative which seems most likely to lead to the achievement of those goals.

On the question of goals, Richard Fenno has argued that "of all the goals espoused by members of the House, three are most basic. They are re-election, influence within the House and good public policy. There are others; but research on the House acknowledges these to be the most consequential."¹⁰ If this view is accepted, we may now consider each of the participants in the assignment process and show how the outcomes of that process affect their goals.

(1) *Requesters*. The impact of committee assignments on the members requesting those assignments is so obvious that it hardly needs to be discussed. If a congressman holds any or all of the goals mentioned above, his committee assignment will have a substantial impact on the probability of achieving them.

A "good" assignment may greatly enhance his value to his constituents and provide unusual opportunities to publicize his activities in Congress; here he can develop the expertise and the reputation as a "specialist" that will enable him to influence his colleagues and important national policies.¹¹

(2) *The Committee on Committees*. The interest of members of the Committee on Committees in what assignments are made is less direct than that of the requesters, but important nonetheless. If a member has a general interest in the policy area of a particular committee, he may support the assignments of congressmen whose views are most congruent with his own. Furthermore, when a piece of legislation important to a member of the Committee on Committees comes before the House, he may call in debts owed to him by congressmen he has sponsored for committee assignments in order to influence such legislation.¹²

(3) *The Leadership*. The filling of committee vacancies is also important to the Democratic leadership, for much the same reasons as it is to the members of the Committee on Committees.

¹⁰ Fenno, "Congressional Committees," p. 3.

¹¹ Clapp, *The Congressman*, p. 207.

¹² It is clear that such debts are recognized, and that they are called in. One member, commenting on the influence another member had within the House, said, "Much of his power rests with the fact he is on Ways and Means. Since that Committee determines committee assignments, he is in a very important and strategic spot. He makes his deals with various groups as to which people he will support for certain spots. Naturally when the time comes that he wants something, he can make a request and people reciprocate." Quoted in Clapp, *The Congressman*, pp. 29-30.

Committee assignments are vital to the leadership in two ways. First, to the degree that the leadership affects assignments it has an important resource for doing favors for members, for rewarding members for past favors, and for establishing bonds with members that may provide some leverage in future legislative situations. Second, committee assignments are vital to the policy for which the leadership is responsible.¹³

(4) *State Delegations.* Members of a state delegation have an interest in other delegation members serving on committees which affect the interests of their state. Such members serve as a source of information about the committee's business and a resource for influencing the course of legislation on that committee.¹⁴

This discussion could be extended to include the committee chairmen and persons outside the House (e.g., interest groups), but the essence of our point is established. How committee slots are assigned is of vital interest to many individuals and groups, because those assignments will have an impact on the achievement of their goals within the House.

Data and Analysis

The empirical analysis, which constitutes the bulk of this current study, employs *request* data from four Congresses. In all, we have data on the committee requests, in order of preference, of 106 freshmen and 89 nonfreshmen Democratic representatives. It is important to reiterate the distinctiveness of these data. Ordinarily, analyses of committee assignments are based on the *results* of the process, from which inferences about the process are drawn.¹⁵ By using request data, however, we are in a position to assess the extent to which the process links requests on the one hand with final assignments on the other. Moreover, we may now determine who benefits and who is harmed by the assignment process, not in terms of so-called objective standards of "good" and "bad" assignments, but rather in terms of the subjective preferences of the actors affected. All these possibilities permit somewhat keener insights into the characteristics of this important internal process.

The first aspect of the assignment process we will consider is the requests themselves: what committees are requested most often, and how many requests are made. For this part of the

analysis we will consider only the requests of freshman Congressmen. Nonfreshmen already hold committee assignments and, because of service restrictions,¹⁶ are prevented from applying for certain committees (unless they are trying to transfer from the committee they hold).¹⁷

Table 1 presents these data on freshman requests. The first column gives the total number of requests for each of the standing committees. The second column gives the percentage of all requesters who applied for a slot on each of the committees. The last column indicates the percentage (and number) of all requests that were the requesters' first choices. Thus, 15 congressmen (nearly 14 per cent of all freshmen) requested Agriculture Committee slots. It may be further noted, however, that of these 15 requests, 7 were first preference requests.¹⁸

Although this table does indicate the distribution of preferences for the various standing committees, consideration of aggregate demand to determine committee desirability is potentially misleading. First, the distribution of pref-

¹⁶ The standing committees of the House are divided into three classes: exclusive, semi-exclusive, and non-exclusive, and there are rules which govern assignments to each class. Members of exclusive committees may serve on no other committee. Members of semi-exclusive committees may be given a second assignment only on a nonexclusive committee; and members of nonexclusive committees may be given second assignments on any semi- or nonexclusive committee. During the period covered by this study the committees in these classes were: *exclusive*: Appropriations, Rules, and Ways and Means; *semi-exclusive*: Agriculture, Armed Services, Banking and Currency, Education and Labor, Foreign Affairs, Interstate and Foreign Commerce, Judiciary, Public Works, and Science and Astronautics; *nonexclusive*: District of Columbia, Government Operations, House Administration, Interior and Insular Affairs, Merchant Marine and Fisheries, Un-American Activities, and Veterans Affairs. In addition, Post Office and Civil Service was changed from semi-exclusive to non-exclusive status at the beginning of the 88th Congress. Finally, the twenty-first standing committee, Standards of Official Conduct (established in 1967) seems to occupy a special status since it is a third assignment for a number of members.

¹⁷ We do, however, include the requests of two nonfreshmen who were first elected in special elections near the end of a Congress. They were not assigned to any committees then, and thus they are in the same position as freshmen.

¹⁸ The reader will note that only 18 committees are listed in Table 1. Ways and Means is excluded here, and throughout the rest of the analysis, because its vacancies are filled by the caucus. Rules and Standards of Official Conduct are excluded because they were never requested, by either freshmen or nonfreshmen. In regard to Rules, this absence of requests probably reflects the special importance this committee has to the leadership, since almost never is a vacancy on Rules filled by a member not first sponsored by the leadership. See Clapp, *The Congressman*, p. 218; and Manley, *Politics of Finance*, p. 77.

¹³ Manley, *Politics of Finance*, p. 24.

¹⁴ See Bullock, "The Influence of State Party Delegations."

¹⁵ Most of the individual committee studies (e.g., Fenno, Manley) also draw on interviews with committee members to generalize about what led them to seek assignment to the committee and why they were successful.

Table 1. House Committee Requests and First-Choice Preferences of Freshmen^a

Committee	Total Requests	Percentage Requesting ^b	Percentage of Requests First Choice (N) ^c
Agriculture	15	14	47 (7)

Public Works	29	27	31 (9)
Science and Astronautics	15	14	33 (5)
Un-American Activities	2	2	0 (0)
Veterans Affairs	8	7	13 (1)

^a Number making requests = 108.

^b Since requesters submitted multiple requests, this column sums to more than 100%.

^c The number totals to 109 because one requester asked for "Foreign Affairs or Agriculture," and so both requests were considered first choices.

erences reflects the *opportunity structure* as well as the preference structure, so that observations about committee popularity on this basis are necessarily ambiguous.¹⁹ Second, even if we discount the effects of opportunity, the aggregate demand for a committee vacancy may not accurately reflect the intensity of preference for that vacancy. To take one example, although aggregate demand for Agriculture and Post Office-Civil Service is approximately the same (14 per cent and 12 per cent, respectively), there is a great difference in the proportion of those requests that are first choices (47 per cent and 23 per cent, respectively).

More important than the two previous points, however, is that attempts to provide an aggregate measure of committee desirability are inconsistent with the conception of the legislator's behavior as goal-directed. All congress-

men are not the same. Their goals differ, and the kinds of constituencies they represent vary. Thus, we would expect committees to have *differential* appeal to different types of congressmen.

The next two tables lend credence to this expectation. While it is difficult to measure the personal goals of legislators, it is probably safe to assume that most freshmen are initially concerned with firming up relationships with their constituencies. This is probably a minimal requirement for the pursuit of policy goals and internal House influence, and is, of course, directly relevant to the goal of reelection. Thus, we can classify members according to the kinds of districts they represent in order to demonstrate the extent to which "committee popularity" varies with constituency types.

In Table 2 we have classified districts according to region and population per square mile. Although the classification is crude and the choice of variables somewhat arbitrary,²⁰ this

¹⁹ Thus a problem with using requests or appointments as a measure of committee desirability results from anticipated reactions. A freshman will probably refrain from requesting the committee he most wants if he believes there is no chance of getting it. Table 1 seems to support this view in regard to requests for Appropriations, which (along with the other two exclusive committees) is generally recognized to be the most sought-after committee. It is, however, also recognized that freshmen have little chance to be appointed. (Indeed, in the four Congresses analyzed here, no freshman was appointed.) There does not, however, seem to be any evidence of anticipated reaction in regard to requests for other committees.

²⁰ Differences among districts on a regional basis are well known, hence the selection of that variable. Regions are defined as follows: *Northeast*: Conn., Del., Me., Mass, N.H., N.J., N.Y., Penn., R.I., Vt.; *Border*: Kent., Md., Mo., Okla., W.Va.; *South*: Ala., Ark., Fla., Ga., La., Miss., N.C., S.C., Tenn., Tex., Va.; *Midwest*: Ill., Ind., Ia., Kan., Mich., Minn., Neb., N.D., Ohio, S.D., Wisc.; *West*: Alaska, Ariz., Cal., Colo., Haw., Ida., Mont., Nev., N.M., Ore., Utah, Wash., Wyo.

Population per square mile was selected to tap the relatively urban or rural nature of districts. While per-

scheme suffices to exhibit the very real differences in committee appeal. We have listed those committees requested (at any preference level) by 30 per cent or more of the members in each category containing at least seven requesters.²¹ Immediately one notes that com-

percentage urban would have been a preferable measure in this regard, such data were available on a district basis only for the 88th and 90th Congress. To operationalize this variable the districts were divided into three categories: sparse (less than 100 persons per sq. mi.), medium (100-999 persons per sq. mi.), and concentrated (1,000 or more persons per sq. mi.). Population data were obtained from *Congressional District Data Book: Districts of the 87th Congress* (for the 86th and 87th Congresses) and from *Congressional District Data Book: Districts of the 88th Congress* and its supplements (for the 88th and 90th Congresses). Both books and the supplements are published by the Bureau of the Census.

²¹ The excluded categories and the number of members in each were: East, sparse (3); Border, sparse (4); Border, medium (5); West, medium (3); Border, concentrated (0); South, concentrated (0); Midwest, concentrated (4).

mittees differ greatly in their relative attractiveness to the various groups of representatives. Interior is one striking example. That committee was the most requested for both Midwestern and Western congressmen from sparsely populated districts. These members, moreover, accounted for 80 per cent of the total requests for that committee (16 of 20). The reason is clear: Congressmen from these constituencies can probably serve the interests of their districts better on that committee than on any other. In the words of one Western representative on the committee:

I was attracted to it, very frankly, because it's a bread and butter committee for my state. I guess about the only thing about it that is not of great interest to my state is insular affairs. I was able to get two or three bills of great importance to my state through last year. I had vested interests I wanted to protect, to be frank.²²

²² Quoted in Fenno, "Congressional Committees," p. 6.

Table 3. Requests by Freshmen for Selected House Committees

(Controlling for Interesteds and Indifferents)^a

^a See footnote 23 for definitions.

Other specific examples may be cited. Public Works is requested by 17 of the 41 representatives from sparsely populated districts in the South, Midwest, and West, and they account for 59 per cent of the requests for that committee. Banking and Currency, part of whose jurisdiction includes housing legislation, was the most requested committee by members from districts with concentrated populations in both the East and West.

Thus, as these data demonstrate, there is indeed a difference in the attractiveness of committees to various groups of representatives, and in most instances there is a clear relationship between the type of district represented and the committees most requested.

Table 3 provides even more direct evidence on this score. For five selected committees, we partitioned members into two groups—interesteds and indifferents—depending on constituency characteristics.²³ Although the relation-

²³ These committees were selected because of the availability of constituency data which seemed reason-

ably related to representatives' probable interest in the committee. We borrowed the terms "interested" and "indifferent," and the basic ideas on measuring interest, from Charles Bullock (see "Correlates of Committee Transfers," pp. 22-23), although our specific measures are somewhat different. Bullock, in turn, adopted the terms from David R. Mayhew, *Party Loyalty Among Congressmen* (Cambridge: Harvard University Press, 1966).

Data on constituency characteristics were obtained from the *Congressional District Data Book: Districts of the 88th Congress* and its supplements. In this source data were available on freshmen representatives in the 86th and 87th Congress only if they came from states which were not redistricted after the 1960 census. Therefore the number of members considered in Table 3 is 81 instead of 108.

For each committee a constituency measure was selected, and each representative's district was ranked as either above or below the national average on that measure. If the district was above the national average, the congressman was classed as an interested; if the district was below the national average, the congressman was classed as an indifferent. The measures of the committees are as follows (national averages are in parentheses); Banking and Currency and Education and Labor, percentage of population residing in urban areas

ship between ascribed interest and request behavior varies from committee to committee, it is always in the predicted direction and quite strong. The ratio of the proportion of interests applying for a committee to the proportion of indifferents applying varies from a low of nearly 2 to 1 (Armed Services) to a high of more than 16 to 1 (Agriculture). Moreover, a high proportion of requests for each committee is accounted for by interested requesters.²⁴

These findings lead us to the following conclusions: Since the attractiveness of a committee does vary from member to member, a broad-gauged, systemic property like "committee desirability" may not be appropriate for an understanding of congressional behavior. A few committees (e.g., Appropriations, Ways and Means) may be almost universally desired, but beyond these few, the attractiveness of a committee, and the value of an assignment to it, may depend solely on the interests and preferences of the member under consideration. While to an urban congressman an assignment to Agriculture might be viewed as disastrous, a farm-belt member might prefer it second only to an appointment to Appropriations.

To this point we have been characterizing the empirical request configuration. Before we turn to the data on assignments proper, we should report several additional features of this configuration as it relates to the opportunity structure of the House.

Clearly the decision about *which* committees to request is a complex strategic one for a member to resolve. Additionally, however, he must decide the strategic question of *how many* committees to include in his preference ordering. In many instances (at least with regard to freshmen) the final preference ordering submitted comprises the entire "information environment" of the Committee on Committees. In any event, it does provide one of the few pieces of hard data on members' desires. The extent to which a goal-directed member chooses to vary that information environment, then, becomes an important strategic consideration. (Shortly we examine the relationships among length of

(69.9 per cent); Interior and Insular Affairs, land area of district (8,159 sq. mi.); Armed Services, percentage of the total labor force who are members of the armed forces (2.5 per cent); and Agriculture, percentage of the employed civilian labor force employed in agriculture (6.6 per cent).

²⁴ The proportion of Armed Services requests made by interested is by far the lowest. This is probably because interest in this committee is determined by other things besides a relatively large number of servicemen in a district (e.g., large defense plants or a hope of attracting defense bases or plants to a district in the future).

Table 4. Number of Requests by Freshmen and Nonfreshmen^a

Number of Requests	Freshmen		Nonfreshmen	
	N	%	N	%
1	24	22	71	82
2	15	14	9	10

Total	108	100	87	100

^a Here also the two unassigned nonfreshmen are included with the freshmen (see note 17).

preference ordering, assignment success, and other features of the opportunity structure.)

Initially we consider this decision as faced by freshmen and nonfreshmen. The strategic problems facing these two groups are very different. The freshman has no committee assignment at all. He desires a good committee, but he knows for certain that he will be assigned to *some* committee. That is, any committee assignment is possible, the range of alternatives open to the Committee on Committees is maximal, and the member is entirely at the Committee's mercy. The nonfreshman, on the other hand, already has a committee, one which he may keep as long as he wishes. Thus, he need not worry about being given a committee less desirable than the one he holds.

Therefore, if the member assumes that, circumstances permitting, the Committee on Committees will attempt to satisfy his request (obviously he must assume this, or else it would be irrational to bother making any requests at all), the two groups are likely to follow different strategies regarding the number of requests they make. Freshmen are likely to offer the Committee on Committees a wider range of alternatives (i.e., make more requests), while nonfreshmen will probably be much more specific in their requests. As Table 4 shows, the data are in accord with these expectations. Only 22 per cent of the freshmen make only one request, while 82 per cent of the nonfreshmen do so.

Within the freshman category in Table 4, there is considerable variation in the number of requests.²⁵ Some of this variation in request behavior reflects variations in opportunities con-

²⁵ We restrict the following discussion to freshmen because the argument about a nonfreshman's ability to be more specific in his requests applies as well here as it did above.

Table 5. Number of House Committee Requests by Freshmen^a
(Controlling for State Vacancy and State Competition on First-Choice Committee)

Number of Requests	State Vacancy				No State Vacancy

^b Error is due to rounding.

fronting members.²⁶ The data of Table 5 are wholly consistent with this hypothesis. In this table we look at two features of the opportunity structure (unfortunately, our total N is too small to permit the meaningful introduction of other relevant features). The first is whether a member is confronted by competition for his first-choice committee by another member of his state delegation. Since the only way a member can get assigned to a committee is to be nominated by his zone representative, a member's probability of getting a particular assignment is substantially reduced if the zone representative or the Committee on Committees must choose among two or more members from the same state. Therefore, we would expect a member to "hedge his bets"—that is, make a greater number of requests—if another member from his state is requesting his most-preferred committee.

The second feature of the opportunity structure that may influence the decision concerning the number of requests a congressman makes is the source of vacancies. It is apparent that at least the large states regard themselves as entitled to one or more seats on important committees, and that members, when requesting assignments, feel that a claim made on "their state's" vacancy is a persuasive argument in their favor.²⁷ Thus a member whose most preferred committee (as revealed by him in his preference ordering) contains a state vacancy

may be more likely to list few options, *ceteris paribus*, than other members.

As Table 5 reveals, when a state vacancy exists, the presence of state competition makes a great deal of difference in the number of committees requested. With state competition, no member makes fewer than three requests, but without state competition, 75 per cent do so. When no state vacancy exists, state competition has no effect; 36 per cent make fewer than three requests with state competition, and 36 per cent make fewer than three requests without it. (There is a large difference, in the predicted direction, in the number that make a *single* request.) Furthermore, in the absence of state competition, a member is much more likely to submit fewer than three requests if there is a state vacancy than if there is not (75 per cent versus 36 per cent). Thus, as we expected, both the existence of state competition and the presence of a state vacancy exert an independent impact on the number of committees requested by freshmen.

So far, we have examined the committee assignment process from the point of view of the requester. We now consider who is successful in getting the assignments he requests, viewing the process in terms of the goals of the members of the Committee on Committees and the leadership.

Above we stated that the member must assume that, if circumstances permit, the Committee on Committees will try to satisfy his request. We also argued that the number of requests a member makes depends on certain strategic considerations, and thus we implicitly argued that a member would think that his probability of getting *some* requested committee depends (at least in part) on the number of requests made. In Table 6 we present data re-

²⁶ Here we consider opportunities to depend upon certain objective conditions, such as number of vacancies for a given committee (supply), number of requests (demand), and service restrictions regarding dual requests (formal rules), and upon informal norms which may guide the allocation of committee vacancies, such as "same-state" norms for appointment.

²⁷ See Bullock, "The Influence of State Party Delegations," and Clapp, *The Congressman*, pp. 220, 238.

lating to these points. Freshmen and nonfreshmen are treated separately to prevent seniority from contaminating the results.

When the data are examined we find that in regard to freshmen our first statement is more correct than our second. That is, almost three-fourths of the freshmen do get *some* committee that they requested, and the probability of getting *no* choice is affected little by the number of requests. For nonfreshmen, on the other hand, more requests do increase chances of some success.

The most striking finding in Table 6, how-

ever, results from our treating freshmen and nonfreshmen separately. Contrary to what one might expect in a body in which seniority is often important, freshmen are much more successful in getting requested assignments than are nonfreshmen. This finding is reinforced by the data in Table 7, which shows assignment success by amount of seniority. We find that the probability of receiving *no* request monotonically *increases* as seniority increases.

This result should not be entirely unexpected, for many references in the literature on committee assignments claim that seniority is

Table 7. Seniority and Success in Assignment to House Committees

often ignored when circumstances dictate. For example, Clapp claims that

given a contest for an important committee assignment, in which returning members of Congress may wish to transfer from another committee and find themselves competing with each other and with freshmen congressmen, seniority is not infrequently brushed aside, if it will not bring about the outcome desired by those making the decision.²⁸

Another observer of the process stated:

Seniority may control if all other things are equal. But other things usually are not equal. Sometimes you begin to think seniority is little more than a device to fall back on when it is convenient to do so.²⁹

To assess the accuracy of this last statement, we examined a situation where it is more likely for "other things" to be "equal": the case when two members from the same state are competing for the same committee. We looked at all committees that had vacancies, and determined for each requester whether another member from the same state was applying for that committee, and if so, whether the other member was more senior. The relevant data are presented in Table 8. It is clear that a request for

which there is no same state competition has a likelihood of about one chance in three of being granted. When there is competition, however, a member has about one chance in four of success if his competitor is not more senior, while he has only one chance in fourteen if the competitor is more senior. Thus in this instance, where "other things" are more likely to be "equal," seniority may become very advantageous, although it is generally not.

What then are the things that in other situations are *not* "equal"? That is, in terms of the goals of members who determine committee assignments, what factors cause them to ignore seniority? Clearly, many kinds of interacting and even conflicting motivations may influence the members of the Committee on Committees. Thus it is dangerous to posit either a single motive for all members of the Committee on Committees or even for any one member. Still, it is not unreasonable to assess the extent to which the data support any of these motives.

The first motive or goal for Committee on Committees members we have posited might be termed the *management goal*. The Committee on Committees, in this view, is concerned solely with satisfying requester demands. Thus, it acts as an "impersonal" preference aggregation device in an effort to keep requesters happy. In reporting on this motive, we find it useful to contrast it with another, the *constituency interest goal*. According to this goal, committee makers ignore request data, concerning themselves instead with matching individual members to committee vacancies on the basis of constituency characteristics and interests.

The data relevant to this comparison are presented in Table 9. For the committees investigated in Table 3 we partitioned freshmen³⁰

²⁸ Clapp, *The Congressman*, pp. 226-227.

²⁹ Quoted in Clapp, *The Congressman*, p. 226. We should note here that the data in Tables 6 and 7 indicate only overall success and not success in those instances where the requests of freshmen and nonfreshmen are in direct competition. Masters states that "when two or more members stake a claim to the same assignment, on the ground that it is essential to their electoral success, both party committees usually, if not invariably, will give preference to the member with longer service" (Masters, "Committee Assignments," p. 354). We do not know what arguments were made about electoral success, but in our data 50 nonfreshmen were in competition with one or more freshmen for assignments to semi- or nonexclusive committees which had insufficient vacancies to satisfy all requests. Of these 50 members, 23 were passed over in favor of freshmen. This does not include instances where the passed-over member received another, more preferred, assignment.

³⁰ We restrict our attention here to freshmen not only because of the effects of seniority on both request behavior and success, but also because the situation is much more complex in regard to nonfreshmen. Mini-

Table 9. Interesteds, Requests, and Success in House Committee Assignments^a
(Freshmen)

Interested ^b Requested	Yes Yes	Yes No	No Yes	No No	Total
<i>Committee</i>					
Banking and Currency	47 (17)	0 (19)	33 (9)	3 (36)	15 (81)

^a Each cell gives percentage of *N* assigned to that committee (*N* in parentheses).

^b See footnote 23 for definition of interesteds.

members according to two criteria: whether they qualify as interested and whether they requested the committee. The results suggest that the management goal dominates the constituency interest goal. In most instances (the small *N*s make firm conclusions difficult), interested-requesters get the nod. Moreover, for every committee, requesting-indifferents are more successful than nonrequesting-interesteds. Minimally, we conclude that committee makers do not take member requests lightly—that, in requesting a committee, a member is not waltzing before a blind audience.

A third obvious candidate as a motivational hypothesis for members of the Committee on Committee in *party maintenance*. Whether a member is interested in influencing policy outcomes or in influence for its own sake, one thing that in part determines the amount of such influence is the majority or minority status of his party. A member has more influence if he is Speaker than if he is Minority Leader, more influence if he is chairman of a committee than if he is ranking minority member, and probably more influence if he is on the majority side of the committee than if he is in the mi-

nority. Therefore it is in the interest of most Committee members to help insure the reelection of party colleagues. Thus the question arises, who needs the most help? Clearly, the members most in need of help are those who were elected by the smallest margin. *Ceteris paribus*, a member elected with 51 per cent of the vote is more likely to be defeated than one elected with 61 per cent. Thus, we would expect members from marginal districts to be more successful than members from safe districts. (We have termed a district marginal if the member was elected with less than 55 per cent of the vote.)

As the data in Table 10 show, our expectations are correct. Marginal freshmen are slightly less likely to fail to receive a requested committee and are much more likely to receive their first choice than are safe freshmen.

Marginal nonfreshmen are *much* less likely to receive no choice than are safe nonfreshmen, but they are about equally likely to receive their first choice as are safe nonfreshmen. We also find that some of the difference in success between freshmen and nonfreshmen disappears here—that is, safe freshmen are treated about the same as marginal nonfreshmen. When one recalls that these nonfreshmen, even though they are marginal, have demonstrated (at least once) their ability to get re-elected, it does not seem surprising that these two groups are about equally successful.

The perceived stand of the individual member on specific issues is yet another basis on which committee makers may determine as-

minally we would have to control for whether a representative is already a member of a committee for which he would be classified as an interested. Further, we would probably want to control for whether the requests made are for transfers or dual service assignments. Also we would want to exclude prestige committee requests. These controls would make the *N*s so small and would break them into so many categories that a meaningful test would be impossible.

signments.³¹ Their prime concern here is the degree to which members will support the party position on issues which come before the standing committees (*party support goal*). While detailed considerations of individual committees are beyond the scope of an initial study such as ours, two pieces of evidence may shed some light on this question. Generally speaking, southern Democrats are less likely to support their party's position than are northern Democrats. Therefore, whether we consider the granting of a specific request a reward for past behavior or an attempt to gain influence over future behavior, the leadership should be less likely to intervene with the Committee on Committees on behalf of a southerner than a northerner. Moreover, since the Democratic members of the Ways and Means Committee are more liberal and more supportive of their party than is the average House Democrat,³² those members, even when acting on their own, are likely to be more favorably disposed toward the requests of northern Democrats than toward those of southerners. Therefore, we would expect southerners to be less successful than northerners in obtaining requested committees.

As Table 11 shows, the data support this hypothesis. For both freshmen and nonfreshmen, southerners are more likely than nonsoutherners to receive *no* request. They are less successful than their colleagues from other regions in getting their first choices as well. One might wonder, however, whether this finding of lesser success among southerners does not simply repeat our finding concerning marginal versus safe districts. That is, since southerners are more likely to come from safe districts,³³ they may be less successful than nonsoutherners simply because they are elected by larger margins. To examine the possibility we present in Tables 12 and 13 data on region, margin of election, and assignment success for freshmen and nonfreshmen, respectively.

Since there are few marginal freshmen southerners and no marginal nonfreshmen southerners, we will focus our discussion on members from safe districts. As the data demonstrate, even when marginal members are removed, southerners are less successful than are nonsoutherners. Among both freshmen and

³¹ In addition to our discussion of member goals above, see Masters, "Committee Assignments," pp. 354-355, and Clapp, *The Congressman*, pp. 228-230.

³² See Fenno, "Congressional Committees," pp. 33-34, and Manley, *Politics of Finance*, pp. 29-32.

³³ Using a different definition of safe seats, Wolfinger and Hollinger found that while southerners held only 38 per cent of the Democratic seats in the 88th Congress, they held 63 per cent of the safe seats. See Raymond E. Wolfinger and Joan H. Hollinger, "Safe Seats, Seniority, and Power in Congress," in *New Perspectives on the House of Representatives*, ed. Robert L. Peabody and Nelson W. Polsby, 2nd ed. (Chicago: Rand McNally, 1969), pp. 60-61.

nonfreshmen, safe southerners are more likely to receive no request than are safe nonsoutherners, and are less likely to receive a first request. The evidence is unequivocal: Region has a strong, independent impact on committee assignment success, even when election margin is controlled.³⁴

The second piece of evidence bearing on the

difference between the success of members who are from the same state as their zone representative and that of members who are not.

^b Error due to rounding.

³⁴ This finding is all the more striking in light of the southern Democrats' dominance of the Committee on Committees during this period (see footnote 6). It is, admittedly, dangerous to treat a variable like region as a surrogate for, in this case, expected policy behavior. Support for party policies clearly varies within regions. Moreover, other informal, nonpolicy, behavioral norms are likely to cloud the relationship between region and appointment success. A clear indication of this intra-regional variation is the rather startling differential in success between members from the South and those from outside the South when we control for the state of their zone representative. As the data in Table A show, the southern member who is from the same state as his zone representative is much more likely to secure a requested assignment than are his southern colleagues who are not from the same state as their zone representatives. Whereas 60 per cent of the freshmen who are *not* from the same state as their zone representative fail to receive any committee request, only 18 per cent of those from the zone representative's state delegation are in the same unenviable position. The differential is somewhat smaller for nonfreshmen (75 per cent versus 50 per cent receive no request), but the pattern is the same. For members from outside the South, however, this differential does not appear. There is virtually no

^a Supporters are members whose party support scores were above or equal to the mean for the party for the previous Congress. Cell entries are percentages; *Ns* are in parentheses.

party support goal is presented in Table 14. To construct this table we examined the party support scores of nonfreshmen requesters³⁵ for each of the Congresses in the sample, and compared the assignment success of those whose support surpasses the mean for the party in the previous Congress with those who gave the party less than the mean support. In each of the four Congresses, high party supporters were more successful in securing assignments (i.e.,

being granted any one of their requests) than low party supporters. Part E of this table gives the aggregate totals: 58 per cent of the high party supporters, as opposed to 37 per cent of the low party supporters, secured a requested committee.

Summary and Conclusions

In this paper we have viewed the Democratic assignment process as an instance of social choice. We have examined the process from the point of view of the members requesting assignments and of the members making assignments. We have assumed that both groups are goal-directed and that an understanding of their behavior derives from an analysis of alternative goals and alternative means (behaviors) of achieving them.

³⁵ We exclude the two nonfreshmen elected in special elections near the close of the preceding Congress for whom there was no party support score data. For each Congress, a member's party support score is tabulated from his voting behavior in the previous Congress. Party support data is found in the appropriate volumes of the *Congressional Quarterly Almanac*: vol. XIV (1958), pp. 124-125; vol. XVI (1960), pp. 140-141; vol. XV/III (1962), pp. 764-765; vol. XXII (1966), pp. 1030-1031.

In regard to those members requesting assignments, we have shown that their choice of committees is related to the type of district they represent. Also, the data indicate that the decision concerning the number of requests to make appears to be affected by certain strategic considerations such as whether the requester is a freshman, whether there is a vacancy from his state on his most preferred committee, and whether another member from his state is competing with him for his most preferred committee.

We next considered the making of assignments. Here we found that about three-fourths of the freshmen are granted some committee they requested. The data showed, however, that nonfreshmen are much less successful. Indeed, the probability of success decreased as seniority increased; therefore other factors were sought in order to explain assignment success. We considered several alternative goals for committee makers—the management goal, the constituency interest goal, the party maintenance goal, and the party support goal—and found strong support in the data for most of them. However, the interaction (and collinearity) among goals precludes any unqualified conclusions.

The assignment process in the House of Representatives is obviously complex, and it is affected by a host of factors, some of them detailed in the body of this paper. Our purposes here have been severalfold. First, we believe it is useful to view the assignment process as an institutionalized allocation process involving goal-seeking actors, scarce but valued commodities, and behavioral constraints. Second, given this view, we have sought to supply a “missing link” in the literature on committee assignments, namely the preferences of committee requests. Not only does this link provide some interesting insights about one group of actors in

the process (requesters); additionally, it provides empirical knowledge about the constraints and information confronting the other significant group in the process—the committee makers. Third, the heuristic use of a social choice construct and the new data on the preferences of committee requesters have brought into focus and provided some order to the complex of strategic factors involved in this process.

The questions for future empirical analysis appear to be almost limitless. For example, future research should consider, instead of surrogate variables like region, the position of members on specific issues before and after the assignment decision. Another aspect to be examined is the behavior of individual members of the Committee on Committees. What requesters from which zones are most successful? Do zone representatives appear to nominate members whose views are like their own? A third aspect of the process which deserves further consideration is the opportunity structure: Are members who are granted their first choice more likely to make further requests in the future, and if so are they very successful? Are members who receive no request initially granted a good assignment at some later time, or are they perpetually unsuccessful?

The research reported here is not distinctive in one respect: It raises as many questions as it answers. Nevertheless, we feel this study has provided some initial direction for a more comprehensive, formal understanding of the committee assignment process, and thus of internal relationships in the House as a whole. In this fashion, we believe, students of the public sector will begin to ascertain some of the operating characteristics of its institutions and thus be in a better position to make sound evaluations and prescriptions.

Candidates' Perception of Voter Competence: A Comparison of Winning and Losing Candidates*

CHONG LIM KIM
DONALD P. RACHETER

University of Iowa

The purpose of the research reported in this article is to test the "congratulation-rationalization effect," a highly provocative hypothesis that John Kingdon has formulated in regard to politicians' beliefs about voters.¹ Comparing the beliefs that winning and losing candidates held about voters, Kingdon discovered that the winners manifested significantly more favorable beliefs than the losers.² Drawing upon a theory of cognitive dissonance of the Festinger variety, he offered an interesting interpretation of the findings.³ Both winners and losers, argued Kingdon, are likely to confront a dissonance-producing situation after an election and therefore are likely to alter their beliefs about voters. This reasoning led him to hypothesize that winners tend to develop complimentary beliefs about voters while losers tend to rationalize their defeats by downgrading voters' competence. The essence of the "congratulation-rationalization" hypothesis in Kingdon's original formulation is this: As a result of the election outcomes, winners tend to change their beliefs about voters in a favorable direction, whereas losers tend to alter such beliefs in an unfavorable direction.

The hypothesis is important, for it has theoretical implications for the role of elections in

the democratic process. This hypothesis implies, in the first place, that elections produce a favorable change in the beliefs that an elected official holds about voters' competence. Because of his victory, the politician believes even more than he did previously that the voters are well informed, genuinely interested, and capable of making intelligent choices. Consequently, the elected official may pay closer attention to the voters' opinions and be more responsive to them than if he were not elected. The manifest function of elections in this case is the inducement of responsible behavior on the part of the representative through a rearrangement of the candidates' cognitions.⁴

The hypothesis also has implications for constituency influence on the representative. The "congratulation-rationalization effect" may magnify such influence. The politician often acts according to his conception of the voters' reactions to alternative courses of action he might choose.⁵ The extent to which the representative anticipates the reactions of his constituency is likely to be related to his beliefs about the voters' competence. Hence, the tendency for a winning politician to develop beliefs complimentary to the voters implies that his anticipation of the voters' reactions will weigh heavily on his action. Constituency influence on a representative may therefore increase as a result of the "congratulation-rationalization effect."⁶

Although Kingdon demonstrated a significant difference between winners and losers in

* Research for this project was supported by two grants from the Graduate College of the University of Iowa to one of the authors and we acknowledge our gratitude. We also wish to thank John W. Kingdon of the University of Michigan for his helpful criticisms of an earlier version of this article.

³ See, for example, Leon Festinger, *A Theory of Cognitive Dissonance* (New York: Row, Peterson, 1957); Leon Festinger and J. M. Carlsmith, "Cognitive Consequences of Forced Compliance," *Journal of Abnormal and Social Psychology*, 58 (March, 1959), 203-10; Robert B. Zajonc, "The Concepts of Balance, Congruity, and Dissonance," *Public Opinion Quarterly*, 24 (Summer, 1960), 380-96; Jack W. Brehm and Arthur R. Cohen, *Explorations in Cognitive Dissonance* (New York: John Wiley, 1962); and Florence L. Denmark and Brunhilde Ritter, "Differential Cognitive Dissonance and Decision Latency," *The Journal of Social Psychology*, 86 (February, 1972), 69-74.

⁴ Political theorists have attributed various functions to elections. Elections have been considered as devices for selecting leaders and legitimizing the regime, means of giving the citizens direct and indirect control over government policies, channels for the expression of public choices, and links between officials and the voting public through which influence is exchanged. However, cognitive effects of elections such as the one stated in this hypothesis have not been explicitly formulated as part of the functions of elections. See, for example, Richard Rose and Harve Mossawir, "Voting and Elections: A Functional Analysis," *Political Studies*, 15 (June, 1967), 173-201; and Gerald Pomper, *Elections in America* (New York: Dodd, Mead, 1968), pp. 16-40.

⁶ Kingdon, "Politicians' Beliefs," pp. 144-45.

their beliefs about voters, he was unable to test the hypothesis. Since his study was based on interview data collected after an election, it was not possible for him to compare candidates' beliefs about voters before and after the election, a comparison essential to test such a hypothesis.⁷ Therefore, whether winners really change their beliefs in a favorable direction and whether losers alter their beliefs in an unfavorable direction still remains an open question.

The Iowa Election Study provides an excellent opportunity to test the "congratulation-rationalization" hypothesis. Candidates for office were asked to indicate their beliefs about voters both before and after an election. All contested candidates who ran in the 1970 Iowa general election were included in the study. The data were collected by means of mail questionnaires.⁸ The pre-election survey, conducted in October and November 1970, included 262 candidates.⁹ Of these, 202 candidates returned usable replies, which represents a 77 per cent response rate. Given our before-and-after design, we sent out questionnaires after the general election only to those who had responded to the pre-election survey. One hundred seventy-three of the winning and losing candidates responded to the follow-up questionnaire, an impressive 86 per cent of all those who responded to the first questionnaire. In addition to various standard information on the candidates' social and career background characteristics, we also solicited information regarding their beliefs

about voters, their pre-election anticipations of the election outcomes, their political ambition, their support for the institution of elections, and the 23 paired-item *Rotter Internal Versus External Control Scale*.

Measurements of Key Variables

Candidates' beliefs about voters consist of their theories, implicit or explicit, about the manner in which voters make their electoral choices.¹⁰ An important part of such beliefs relates to candidates' perceptions of voters' competence, that is, the extent to which they believe the voters are deeply interested in campaigns, the extent to which they believe the voters are informed of key issues, and the extent to which they believe the voters make intelligent choices on the basis of the issues rather than on the basis of party labels or candidate characteristics. When elected, the candidates who believe that the voters are politically interested, informed, and capable of making intelligent choices are probably more likely to be constrained by the voters' opinions than are other candidates who have less favorable perceptions of voters' competence.¹¹

Another part of candidates' beliefs is their conception of what factors influence voters' choices. The voting studies have identified three major factors of this sort: party identification, issues, and candidate orientation.¹² The candidates were asked both to rate and to rank the relative importance of each of these three factors, before and after the election. If the "congratulation-rationalization effect" is indeed operative, one would expect that winners change in their rankings of the three factors in the direction complimentary to voters, whereas losers change in the direction deprecating to voters. More specifically, one might expect that the winners who ranked party or issues as first in importance before an election, would subsequently rank the personal characteristics of candidates as first.¹³ Conversely, the losers who

⁷ The "congratulation-rationalization" hypothesis involves changes in candidates' beliefs and the direction of such changes. To test the hypothesis, one needs data on attitude changes. Interview data collected at a single point in time, the kind of data used in Kingdon's study, do not provide an adequate basis to test the hypothesis.

⁸ Certain typical problems are associated with the use of mail surveys. Briefly, these problems relate to the type of data which can be gathered, the type of respondents who can be reached, and the response rate. In the present study, these problems were recognized and dealt with as fully as possible. First, the questionnaire used was brief, and the questions asked were simple and straightforward. Moreover, many of our questions had been used in several previous studies and their reliability had been tested. Second, our respondents were an ideal sample for a mail survey. They were candidates for public office, a relatively well-educated and articulate group. We found almost no "nonresponses" in the returned questionnaires. Finally, the response rate for the pre- and postelection surveys were impressive. For a good discussion of the problems associated with the use of mail surveys, see William J. Goode and Paul K. Hatt, *Methods in Social Research* (New York: McGraw-Hill, 1952), pp. 170-83.

⁹ This figure represents all contested candidates who ran in the 1970 general election in Iowa. There were also 32 candidates who were unopposed in the election. We did not include these unopposed candidates in our survey.

Scale Scores

Increase in perception

Decrease in perception

initially ranked issues or candidate characteristics as first, would rank party labels as the most important factor after an election.

The operational measurement of candidates' perceptions of voters' competence is a summated scale, constructed on the basis of the candidates' responses to three questions.¹⁴ These questions have to do with the candidates' beliefs concerning voters' political interests,

their political knowledge, and their capacity to make intelligent electoral choices.¹⁵ Each candidate who responded was assigned a score based on the arithmetic sum of his coded responses. The scale scores range between 0 (least favorable) and 6 (most favorable).¹⁶ Table 1 displays data concerning the candidates' perceptions of voters' competence before and after the election. Of 159 candidates who re-

(2) we assume that when a candidate rates party labels as first in importance, he is rationalizing his defeat by blaming voters for blindly voting for party. These are the assumptions which Kingdon has made in his study. We recognize at this point that another plausible assumption which contradicts our first assumption can be made: when a candidate rates candidate characteristics as the most important factor, he might be downgrading the voters. To believe that the voters make their choices on the basis of candidates' personal characteristics could mean that a candidate is disparaging their political sophistication. However, our objective is to test the validity of Kingdon's hypothesis and therefore we adopted his assumptions. See his "Politicians' Beliefs About Voters," pp. 139-40.

¹⁴ When responses to several questions are aggregated to form a single measure as was the case in our summated scale, we might be in effect losing some information. Therefore we have also scrutinized responses to

individual questions. The results of the item-by-item analysis did not change our basic arguments. See Donald P. Racheter, "Representation and the Congratulation-Rationalization Effect" (M.A. thesis The University of Iowa, 1972).

¹⁵ The questions used were: (1) Would you indicate how important you think the candidates' issue positions are to the voters in determining their choices? (2) Generally speaking, how interested in the campaign do you think the voters in your district are? (3) How well informed do you think the voters in your district are about the candidates' issue positions? The same set of questions was repeated in the postelection survey with only the tense changed.

¹⁶ Responses to the three voter competence items were coded: (0) Not important (or informed), (1) Somewhat important (or informed), and (2) Very important (or informed). These coded responses were summed to form a simple index.

Table 2. Change in Candidates' Perception of Voters' Competence by Election Outcomes
(Percentages)

Election Outcomes	Change in Perception													Total (N)
	+6	+5	+4	+3	+2	+1	0	-1	-2	-3	-4	-5	-6

turned usable questionnaires before and after the election, 51 (or 32 per cent) reported an increase in their favorable perceptions of voters, while 55 (or 35 per cent) reported a decrease. Almost one-third of the candidates indicated "no change" in their perceptions. From these results, a measure of the direction and the magnitude of changes in candidates' perceptions was constructed. This measure, which ranges between scale scores of +6 and -6, is designed to indicate the degree of increase or decrease in favorability of a candidate's perception of voters' competence.¹⁷

Findings

1. Changes in Candidates' Beliefs About Voters. The hypothesis that winners tend to develop complimentary beliefs about voters while losers tend to develop deprecating beliefs may be tested in two ways: (1) a comparison of winners and losers in terms of the direction and the magnitude of changes in their perceptions regarding the competence of voters, and (2) an analysis of changes that take place in candidates' rankings of the relative importance of three factors which influence voters' choices: party labels, issues, and candidate characteristics.

The data presented in Table 2 show little difference between winners and losers in terms of the direction and the magnitude of changes in their perceptions regarding the competence of voters. Among the winners, roughly 37 per cent did not change in their perceptions. Among the losers 31 per cent did not change, indicating a slight, but statistically insignificant, tendency for winners to have more stable perceptions than losers ($t = 0.53$, $df = 157$, *n.s.*). While some 30 per cent of the winners showed an increase in their complimentary beliefs, 34 per cent of the losers also did. Similar proportions of the winners and losers indicated a decrease

in such beliefs: 33.8 per cent and 35.3 per cent respectively. Thus, the evidence makes it quite clear that winners do not necessarily develop complimentary beliefs more than do losers. Conversely, losers do not necessarily develop more deprecating beliefs than winners.¹⁸

A supplementary analysis was performed to test the hypothesis. Instead of relying upon the candidates' perceptions of voters' competence, we focused on changes that took place in the candidates' rankings of the relative importance of the three factors influencing voters' choices. By comparing their pre- and postelection rankings, we were able to determine shifts that occurred in their relative rankings of party labels, issues, and candidate characteristics.

According to the "congratulation effect," one might predict that the winners who initially ranked party or issues first in importance are likely to rate their own characteristics as first after an election. Conversely, the losers who ranked issues or candidates as first in importance are likely to rank party as the most im-

¹⁸ Additional evidence is available. When we compared the winners and losers in terms of their pre- and postelection perceptions, we discovered as shown in Table A that the winners manifested much more favorable perceptions than the losers after the election, and that the subsequent winners also manifested significantly more favorable perceptions than the subsequent losers before the election. This means that the winners had more favorable perceptions than the losers from the outset.

Table A. Candidates' Perception of Voters' Competence Before and After General Election
(Percentages)

Scale Scores	Before Election		After Election	
	Winner	Loser	Winner	Loser
Least Favorable	0	3.4%	7.2%	2.7%
	1	0.0	6.2	0.0
	2	9.1	13.4	9.5
	3	3.4	7.2	6.8
Most Favorable	4	19.3	20.6	21.6
	5	28.4	15.5	29.7
	6	36.4	29.9	29.7
	6	36.4	29.9	29.7
Total (N)	100% (88)	100% (97)	100% (74)	100% (85)
$t = 2.04$		$p < .025$	$t = 2.72$	$p < .005$

¹⁷ The measure for the direction and the magnitude of changes in candidates' perceptions regarding the competence of voters was constructed from the two summated scales of voters' competence: the pre- and post-election scales. To obtain scores for changes in candidates' perceptions, the postelection scores were subtracted from the pre-election scores.

Table 3. Change in the Relative Ranking of Three Factors
(Percentages)

Change in Ranking	Most Important Factor		Least Important Factor	
	Winner	Loser	Winner	Loser
From Issues or Candidate to Party Label	25%	78%	28%	66%
From Party Label or Issues to Candidate	75	22	72	34
Total (N)	100% (20)	100% (27)	100% (40)	100% (29)
	$\chi^2 = 12.95,$	$P < .001$	$\chi^2 = 12.10,$	$P < .001$

Note: The total in the table does not add up to 173 candidates, because many did not fit the four types of change reported above. Of all candidates, 39 per cent did not change in their rankings; 19 per cent changed from party to issues; and 10 per cent changed from candidates to issues.

portant factor after an election, due to the "rationalization effect." With respect to the shifts that occur in the least important factors, one might expect that the winners who initially ranked issues or candidates as last in importance are likely to rank party labels as the least important after an election. In a similar vein, the losers who ranked party or issues as last in importance at the outset, are likely to rank candidate characteristics as the least important after the election.

There are six logically possible types of change in the candidates' rankings of the relative importance of party, issues, and candidates.¹⁹ Table 3 reports only that portion of the data most relevant to testing the hypothesis.²⁰ Focusing upon factors ranked as the most important, one finds that the winners more than the losers tended to alter their ranking from party or issues to their own characteristics, suggesting that the winners tend to congratulate voters for "making the right choices." By comparison, the losers more than the winners tended to change their ranking from issues or candidates to party label, which indicates that the losers tended to downgrade voters for "blindly voting for party labels." Looking at the shifts which occurred in the least important factors, however, one is struck by a finding contradictory to the prediction. The winners

who ranked party or issues as least important at the outset tended to rank candidate characteristics as least important after the election. Among the losers, those who ranked issues or candidate characteristics as least important tended to rank party labels "least important" after the election. Thus, the evidence about ranking shifts is also inconclusive, and does not offer confirmation of the hypothesis that winners develop complimentary beliefs about voters while losing candidates develop deprecating beliefs.

2. Effect of Candidates' Anticipation of Election Outcome. It is quite possible that candidates anticipate the election outcome long before election day. Because of such anticipations, the "congratulation-rationalization effect" might take place even before the actual outcome is known. The candidates were asked to rate their chances of winning in the first questionnaire.²¹ Fifty-seven per cent rated their chances favorably, while some 30 per cent gave pessimistic assessments. If the "congratulation-rationalization effect" does take place before the election as a result of candidates' anticipations of the outcome, one might expect that among the subsequent winners, those who anticipated an election victory at the outset as compared to those who anticipated a defeat, would manifest more favorable beliefs about voters. Again, among the subsequent losers, those who anticipated a victory as compared to those who anticipated a defeat at the outset, should have more favorable beliefs.

The data presented in Table 4 show no evidence to confirm such an effect of candidates' anticipations upon their beliefs about voters.

¹⁹ The six types of change in the candidates' rankings include: (1) from party to issues, (2) from party to candidates, (3) from issues to party, (4) from issues to candidates, (5) from candidates to party, and (6) from candidates to issues.

²⁰ Of the six types of change, only four are directly relevant to testing predictions derived from the hypothesis. Since we assume that changes from issues or candidates to party reflect the rationalization effect and that changes from party or issues to candidates reflect the congratulation effect, we report data on these four types of change. Nevertheless, we have also examined all six types of change separately, and have found no evidence to contradict the conclusion suggested in the text.

²¹ The question was: "How do you rate your chances in the upcoming election?" Responses were coded: (1) Excellent chance to win, (2) Good chance to win, (3) Some chance to win, (4) It's a toss-up, (5) Probably will lose, and (6) Almost sure to lose.

Table 4. Effect of Anticipation on Candidates' Pre-Election Beliefs
(Percentages)

Pre-election Perceptions of Voters' Competence		Winner		Loser	
		Anticipated Victory	Anticipated Defeat	Anticipated Victory	Anticipated Defeat
Most Favorable	6	35.5%	42.9%	32.1%	31.2%
	5	32.9	14.3	20.8	10.4
	4	15.8	28.6	20.8	16.7
	3	2.6	7.1	13.2	2.1
	2	9.3	7.1	9.4	16.7
Least Favorable	1	0.0	0.0	0.0	12.5
	0	3.9	0.0	3.7	10.4
Total (N)		100% (76)	100% (14)	100% (53)	100% (48)
		$X^2 = 3.96$, n.s.		$X^2 = 11.12$, n.s.	

Among the subsequent winners, no significant difference was discovered between those who anticipated a victory and those who anticipated a defeat in terms of their perceptions of voters' competence ($X^2 = 3.96$, n.s.). Similarly, among the subsequent losers, there was no significant difference between those who anticipated a victory and those who anticipated a defeat ($X^2 = 11.12$, n.s.). A supplementary analysis in which we compared candidates' anticipations and the direction of changes in their beliefs also revealed a negative result: the anticipations of the election outcome did not effect changes in candidates' beliefs about voters.²² Thus, one can conclude that neither the actual election outcome nor the anticipations of the outcome have significant effect upon candidates' beliefs about voters.

3. Dissonance States and Changes in Candidates' Perceptions of Voters' Competence.

Thus far, our analysis has concentrated on the

²² The results of this analysis are reported in Table B. It is clear that no significant difference obtains between those who expected to win and those who expected to lose within each group of the winners and losers. This indicates that differences in pre-election anticipations of the election outcomes have no visible impact upon the direction and magnitude of changes in candidates' perceptions regarding the competence of voters.

difference between winners and losers in their beliefs about voters, and changes in such beliefs. The overall evidence lends no clear support for the "congratulation-rationalization" hypothesis. Nevertheless, it seems yet possible to confirm the hypothesis if it is cast in somewhat different terms, terms more consonant with the theory of cognitive dissonance as originally outlined by Festinger. Although Kingdon acknowledged his debt to Festinger's theory, his formulation actually departed from the theory by placing a heavy emphasis upon the independent impact of election outcomes.²³ When Kingdon stated that winners tend to develop complimentary beliefs about voters while losers tend to develop rationalizations for their defeats by downgrading voters' competence, he was evidently assuming that dissonance is a direct consequence of the election outcome. Although a state of cognitive dissonance may result from the election outcome, it depends also upon the candidates' pre-election beliefs about

²³ Kingdon stated that: "winners develop complimentary beliefs about voters and losers develop rationalizations for the losses *simply by virtue of the outcome of the election*" [our emphasis]. See his "Politicians' Beliefs About Voters," p. 142.

Table B. Anticipation of the Outcomes and Change in Perceptions
(Percentages)

Change in Perception	Winner		Loser	
	Anticipated Victory	Anticipated Defeat	Anticipated Victory	Anticipated Defeat
Favorable Change (Increase)	26.6%	33.3%	34.3%	35.0%
No Change	36.7	33.4	15.8	40.0
Unfavorable Change (Decrease)	36.7	33.3	49.9	25.0
Total (N)	100% (60)	100% (12)	100% (38)	100% (40)

voters. What precipitates the "congratulation-rationalization effect" may be a state of dissonance induced by the incongruence between a candidate's beliefs and the election outcome, rather than the winning or losing in itself.

Restated in direct dissonance terms, the hypothesis asserts that within each group of winners and losers it is only those experiencing a high degree of dissonance who will change in their beliefs about voters. The dissonance, rather than the election outcome, is the critical variable in this formulation. High and low dissonance states were established on the basis of (1) the pre-election scale scores for candidates' perceptions of voters' competence, and (2) the election outcomes.²⁴ A candidate who entered the campaign with favorable beliefs about voters and subsequently emerged as a winner may experience less dissonance than other successful candidates who had unfavorable beliefs from the outset. Similarly, a candidate who initially had favorable beliefs but was later defeated may feel greater dissonance than other losers who had unfavorable beliefs from the outset.

In Table 5, the direction and the magnitude of changes in candidates' perceptions of voters' competence are compared by different dissonance states within each group of winners and losers. Looking at the winners first, one finds that as compared to the "low dissonance" group, the "high dissonance" group—the candidates who had unfavorable beliefs about voters at the outset—tended to change their beliefs in a more favorable direction. The rank-order correlation between dissonance states and changes in candidates' perceptions was quite high ($\tau c = .48$). This suggests that winners whose initial beliefs about voters were incongruent with the election outcomes tended to upgrade their beliefs. Thus, there is evidence to conclude that the "congratulation effect," a part of Kingdon's hypothesis, is operative, insofar as winners' initial beliefs about voters and the subsequent election outcomes are not congruent.

With respect to the "rationalization effect," another part of the hypothesis, a strong correlation

was found between dissonance states and negative changes in candidates' perceptions ($\tau c = -.41$). Among the losers, the "high dissonance" group consists of the candidates who entered the election campaign with highly favorable beliefs about voters. These candidates believed at the outset that the voters were well informed on key issues, were deeply interested in the campaign, and were capable enough to make their choices on the basis of issues rather than on the basis of a candidate's party label or his personal characteristics. Despite the highly complimentary beliefs that these candidates held, the voters did not reciprocate with electoral support: they were subsequently defeated. Thus, these candidates were likely to perceive a dissonance between the election outcome and their beliefs about voters. The data indicate that the "high dissonance" group of the losers more than the "low dissonance" group tended to change their beliefs in the direction deprecating to voters. Evidently, the "rationalization effect" is also operative among the losers, insofar as the losers' initial beliefs about voters and the subsequent election outcome are not congruent.²⁵

What emerges in this analysis is this: The "congratulation-rationalization" hypothesis can be confirmed, but only if cast in terms of "dissonance states" rather than "election outcomes." In his original formulation, probably because he lacked pre-election data, Kingdon emphasized the independent effect of the election outcomes—winning and losing. Consequently, he hypothesized that winners tend to develop complimentary beliefs about voters while losers tend to relinquish such beliefs. Clearly, this formulation obfuscates the critical importance of dissonance states by implicitly assuming that changes in candidates' beliefs are direct effects of the election outcomes. Our analysis has shown, however, that the election outcomes do not in themselves effect changes in candidates' beliefs. What causes change in such beliefs is dissonance induced by the *discrep-*

²⁴ The "high" and "low" dissonance groups among the winners and losers were established in the following manner:

Election Outcomes	Scale Scores for the Pre-Election Perceptions						
	0	1	2	3	4	5	6
Won	High Dissonance Group (N=26)			Low Dissonance Group (N=48)			
Lost	Low Dissonance Group (N=56)			High Dissonance Group (N=29)			

²⁵ The data reported in Table 5 also show considerable cognitive changes for the low dissonance groups. For instance, 54 per cent of the low dissonance winners changed their perceptions in both favorable and unfavorable directions. Among the low dissonance losers, almost 72 per cent either increased or decreased in their evaluations of voters. Thus, it seems evident that factors other than dissonance states also act upon changes in the candidates' perceptions. These unidentified factors notwithstanding, the overall evidence clearly indicates that cognitive dissonance explains a large part of the variation in changes of candidates' perceptions. The problems of validating dissonance theory are succinctly discussed in Natalia P. Chapanis and Alphonse Chapanis, "Cognitive Dissonance: Five Years Later," *Psychological Bulletin*, 61 (January, 1964), 1-22.

Table 5. Relation Between Candidates' Dissonance States and Perceptions of Voters' Competence
(Percentages)

Change in Perception*	Winner		Loser	
	High Dissonance	Low Dissonance	High Dissonance	Low Dissonance
Large increase	—	—	—	3.5
Medium increase	11.6	—	—	20.7
Small increase	53.8	10.4	25.1	27.6
No change	19.2	45.8	32.1	27.6
Small decrease	11.6	37.5	28.5	17.1
Medium decrease	3.8	6.3	10.8	3.5
Large decrease	—	—	3.5	—
Total (N)	100% (26)	100% (48)	100% (56)	100% (29)
	Kendall's $\tau c = .48$		$\tau c = -.41$	

* These seven categories were established from the scale scores for the direction and the magnitude of changes in perceptions of voters' competence: Large increase (+6, +5), Medium increase (+4, +3), Small increase (+2, +1), No change (0), Small decrease (-1, -2), Medium decrease (-3, -4), and Large decrease (-5, -6)

ancy between a candidate's beliefs and the election outcome. Therefore, whether or not winners will develop complimentary beliefs and whether or not losers will develop deprecating beliefs depends upon the states of dissonance that such candidates confront after an election, rather than on the election *per se*.

Conclusions

The analysis has disclosed no clear evidence to support the hypothesis that winners tend to develop complimentary beliefs about voters while losers develop deprecating beliefs. Although nearly two-thirds of the candidates were found to have changed in their perceptions of the competence of voters, no significant difference in direction and magnitude of such changes was discovered between the winners and losers. The evidence was again inconclusive when we focused on the shifts that took place in the candidates' rankings of the relative importance of three factors influencing voters' choices: party labels, issues, and candidate characteristics. The winners did not change their rankings of the three factors in a direction visibly more complimentary to voters than the losers, nor did the losers change their rankings in a direction more deprecating to voters than the winners. Therefore, it seems evident that winners do not necessarily develop more complimentary beliefs than losers. Conversely, losers do not necessarily develop more deprecating beliefs.

The "congratulation-rationalization" hypothesis, however, was strongly supported in the analysis when it was refined. In this new formulation, the state of dissonance rather than the election outcome was made the major in-

dependent variable. The results of analysis show that among the winners, the "high dissonance" group more than the "low dissonance" group tended to upgrade their beliefs concerning the competence of voters. By contrast, among the losers, the "high dissonance" group more than the "low dissonance" group tended to downgrade their beliefs about voters. Thus, the evidence suggests that the "congratulation-rationalization effect" is operative to the extent that candidates' beliefs about voters and the election outcomes are incongruent.

Finally, one may ask whether the congratulation-rationalization hypothesis formulated by Kingdon offers a sound explanation of the divergent beliefs held by winning and losing candidates. The findings reported in this article suggest that the hypothesis does not provide an efficient explanation for the phenomenon that winners manifest markedly more favorable beliefs than losers do. It seems clear that winners more than losers have favorable beliefs, but not because winners change their beliefs in a favorable direction as a result of their election victories nor because losers alter their beliefs in an unfavorable direction. Alternative explanations must be sought for the divergent beliefs that winning and losing candidates manifest.²⁸ Possibly such explanations might be found in such factors as the incumbent status of candidates, the degree of competitiveness in their districts, their career socialization, and the level of their political ambition.

²⁸ Kingdon suggested alternative explanations based on the incumbent status of candidates and the marginality of the district. We plan to test some of these explanations in future research. See Kingdon, "Politicians' Beliefs About Voters," pp. 142-43.

Residential Location and Electoral Cohesion: The Pattern of Urban Political Conflict*

TIMOTHY A. ALMY

University of Georgia

Urban scholars, whatever their discipline, have shared a concern for identifying the structural and environmental factors which shape local politics. The literature has become too extensive for a thorough discussion of the many variables which influence local politics, but one possibly important aspect that has largely been ignored by political scientists is the ecological structure of cities.¹

In an effort, therefore, to remedy an apparent oversight in urban analysis, this paper will focus upon the theoretical and empirical relationships between the residential location of social-class groups in selected American cities and the electoral cohesion displayed by such population groups. Attention will also be directed at studying the consequences of this intragroup cohesion upon intergroup conflict as it is manifested in electoral competition. This analysis of residential location and electoral cohesion may provide an opportunity to examine existing propositions concerning the effects of location upon urban political conflict.

Residential location reflects a variety of class-based considerations. Studies have indicated that occupational and educational groups tend to cluster spatially in their selection of residential areas.² Even with low rates of interaction in most neighborhoods, neighbors in homogeneous areas are not only of similar status, but also tend to share the same values and lifestyles.³ Residential location may also be a strat-

egy for minimizing the social and spatial distance between the individual and the population he desires to emulate. Conversely, location also serves to maximize the distance from groups with which the individual does not wish to interact.⁴ Additionally, the creation and erection of homogeneous and exclusive residential areas may also serve to increase the cohesiveness and solidarity of the inhabitants and lead to the development of distinctive group standards.

Several urban scholars have been concerned with the social implications of such group cohesion.⁵ Apparent disagreement about the effect of residential segregation upon group cohesion exists, however, which suggests that we need further empirical study of the relationship between intragroup cohesion and intergroup disagreement. The disagreement centers on whether residential segregation increases or decreases the frictions between social-class groups. The solidarity of segregated classes may also be influenced by the intensity of the electoral disputes between these same groups. The more intense the disputes between class groups, the more may be their intragroup cohesion.⁶

One method that may prove useful in the examination of intragroup cohesion and intergroup disagreement is the analysis of the voting choices of urban residents. The policy choices of various social-class groups reflected in referendum voting on such local concerns as education, civic improvements, taxation, and similar items, can provide an index of both the cohesiveness and distinctiveness of community groups. The analysis of social-class support and opposition to local ballot issues facilitates the identification of segments of the urban popula-

tion that are politically opposed to one another. By focusing upon local referenda voting, we can identify the nature and intensity of political conflicts that exist between electoral groups within many communities.

In summary, this paper is concerned with a pattern of urban conflict. This theme suggests that conflict is spatially patterned and thereby associated with residential location. The following hypotheses will be examined:

(1) Residential location will significantly influence the development of electoral cohesion *within* social-class groups. Social-class groups that are spatially segregated (located in socially homogeneous sectors) in a city will exhibit greater intragroup electoral cohesion in local referenda than spatially integrated social-class groups (located in socially heterogeneous sectors).

(2) Residential location will significantly influence the amount of electoral disagreement *between* different social-class groups. The residential segregation of class groups will promote the development of interclass disagreements, while spatial integration will hinder the development of these disagreements.

(3) The degree of interclass electoral disagreement will influence the degree of intraclass electoral cohesion. This relationship will be influenced, however, by the spatial distribution of class groups within each city. Cities with segregated classes will display high intraclass electoral cohesiveness, irrespective of the degree of interclass disagreement. On the other hand, cities with integrated classes will manifest low electoral cohesion independent of the degree of class disagreements.

Sources of Data and Methods of Measurement

Eighteen cities from a U.S. Public Health Service study of local voting behavior were selected for this study. The two criteria used for the selection of cities were size of city and number of referenda issues for which voting records and precinct maps were complete.⁷ Despite the small base, these eighteen cities represent nearly all regions of the U.S. and offer a good basis for comparison. The two sources of information for this paper are city block demographic characteristics from the 1960 United

States Census of Housing, and precinct-voting results from five types of referenda.⁸

The examination of the distribution and cohesion of population groups is not intended to be a study of the properties of the individuals within the city, instead, it is an examination of the aggregate properties of population groups residing within specified geographical sections of each community. Census statistics give valuable information about the environmental characteristics of an area, while precinct returns provide information about the political texture of an area. Aggregate data, therefore, appropriately provide the basis for the operationalization of the key concepts discussed in this paper. The next task is to elaborate on the methods used in defining these concepts operationally.

A social-class group is comprised of all of the precincts within a city that manifest similar social characteristics. A useful measure of social class presented in the Census of Housing is mean house value, and since housing values appear to be valid indicators of the social status of homeowners, they may be employed as surrogates for such typically used variables as education, occupation, and income. To determine the social-class rank of an individual precinct, the mean house value of each city block within each precinct is aggregated, and the mean house value of the precinct is computed.⁹

Social-class electoral cohesion is the amount of variance between precincts of the *same* social-class group in voting on referenda.¹⁰ A group with low electoral cohesion manifests higher intensity of conflict than a class that is electorally cohesive. If precincts within a social class exhibit a relatively high amount of variance in their voting behavior, there is an electoral division within that class. This division of

⁸ A good discussion on the use of these specific data is provided by Harlan Hahn, "Ecological Data and Structural Characteristics: Some Notes on the Homogeneity of Precincts and Census Tracts (paper presented at the annual meeting of the Western Political Science Association, Albuquerque, N.M., April 8-10, 1971).

⁹ Social-class groups, computed on the basis of mean house values, were the following: Rank 1: mean values less than \$7,320; Rank 2: mean values from \$7,321 to \$11,880; Rank 3: mean values from \$11,881 to \$18,120; Rank 4: mean values from \$18,121 to \$22,680; Rank 5: mean values above \$22,681.

¹⁰ Each city was ranked according to its mean social-class variance in voting for each referendum. The ranks were split at the median into two groups. Two-way analysis of variance statistics also indicated that splitting the ranks at the median resulted in the best homogeneous groupings possible. For fluoridation referenda the cutting-point was 73.6; for education, 70.6; for parks, 70.4; for civic improvements, 76.8; for public works, 82.2.

⁷ Peoria: 125, 736; St. Joseph: 71, 996; Medford: 29, 750; Rockford: 144, 707; Greensboro: 140, 672; Dayton: 239, 591; Fremont: 100, 739; Yakima: 45, 060; Flint: 193, 371; Lima: 53, 373; Berkeley: 113, 165; Allentown: 108, 926; Knoxville: 169, 766; Trenton: 102, 211; Lincoln: 148, 092; Eugene: 77, 284; Beaumont: 115, 716; Sioux Falls: 72, 557.

support for the referenda issues is a demonstration of intragroup electoral conflict.

Interclass electoral disagreement is the degree of variation in voting on referenda between different social-class groups within a city. High variation in voting indicates high disagreement between classes. High disagreement is indicative of electoral conflict within the community.¹¹

It is possible to specify the amount of spatial segregation or integration that a social-class group displays by examining the social dissimilarity scores of each of the precincts within a class group. This dissimilarity score is the amount of class difference between a precinct and all spatially contiguous precincts. Differences are translated into ordinal values varying between zero and one. Precincts with index scores near zero are in areas of very few class differences (socially homogeneous), whereas precincts with index scores approximating one are located in areas of great class distinctions (socially heterogeneous). The aggregation of the dissimilarity scores for all precincts within each class of precincts allows the comparison of the classes in a city on the basis of residential location, i.e., segregated or integrated.¹²

The empirical determination of the spatial contiguity of precincts is made by calculating the geographical distance between all possible pairs of precincts within each city. The calculation of the distance between all pairs of precincts is based upon the designation of the ex-

act geographic location of each precinct. In this manner, the distance between any specific precinct and all other precincts can be examined, and those precincts that are nearest to the precinct in question can be identified according to social-class characteristics.

In addition, each precinct is given a value which reflects the average geographical distance between that precinct and all other precincts of the same class. Another statistic that has been calculated for each precinct is a measure of electoral disparity—the mean difference (percentage of the vote in favor of the referendum) between the precinct and all others within the same social class. Social dissimilarity and electoral disparity are similar to the measures of residential location and electoral cohesion except that dissimilarity and disparity are calculated on a precinct level rather than a social-class level.

The referenda under study include voting on the addition of fluorides into local water supplies, school bond and tax override elections, parks and recreation bonds and tax levies, bonds for the construction and improvement of civic buildings, and bonds for the construction of public works projects, such as streets, sewers, and city water works. This analysis encompasses 58 municipal elections held in these 18 U.S. cities since 1955. Fluoridation referenda account for 12 of the elections, education for 14, parks and recreation for 8, civic improvements for 12, and public works for 12 elections. This rich variety of ballot issues allows cross-community comparison of the pattern of political conflict.

In brief, this paper will test three major hypotheses: (1) An increase in the spatial segregation of social-class groups will be associated with an increase in the electoral cohesion displayed within each group; (2) an increase in the spatial segregation of social-class groups will be associated with an increase in the electoral disagreements between class groups; (3) an increase in interclass electoral disagreements will be associated with an increase in the electoral cohesion within each group but this relationship will be modified by the spatial distribution of social classes within each city.

Residential Location and Electoral Conflict

This investigation is principally concerned with examining the empirical associations between specified ecological variables and patterns of electoral behavior. Previous studies have indicated the need for research identifying the linkages between contextual factors and political processes. To clarify these linkages,

¹¹ Essentially the same technique was used to determine high and low disagreement among classes. For fluoridation referenda, the dichotomy was 136.8; for education, 49.2; for parks, 44.2; for civic improvements, 68.8; for public works, 121.4.

¹² Social class dissimilarity is computed in this way:

$$D_i = \frac{\sum_{i=1}^N \left(\frac{X_{i1} - X_i}{d_{i1}} \right)^2}{\sum_{j=1}^M \left(\frac{M}{d_{ij2}} \right)^2},$$

where D is the amount of dissimilarity between precincts in the i th case, and all surrounding precincts, X_i is the social class of the i th precinct, and X_{i1} is the rank of the i th precinct which surrounds the i th precinct. N_i is the number of precincts with data that are spatially proximate to the i th precinct. M equals maximum ($N_i - X_i, X_i - 1$), where N_i is the number of class groups ($N_c = 5$).

The numerator of the above ratio sums the rank dissimilarities between a precinct and its nearest surrounding precincts. This sum is weighted by the inverse of the square of the geographical distances (d_{i1}^2). (My thanks to W. Bruce Shepard, Oregon State University, for his assistance in developing this formula.) Social-class dissimilarity scores ranged from 5.497 to 22.730. For example, cities above 8.918 were categorized as high in dissimilarity, i.e., residentially integrated.

this paper suggests a model in which electoral cohesion within social-class groups and electoral disagreements between these groups are associated with the residential location of class groups in cities. In addition, the model implies that the association between interclass electoral disagreement and intraclass electoral cohesion is mutual in that each variable affects the other. The following indicates the direction of the hypothesized associations. As the model suggests, the associations between location and cohesion, and location and disagreement, are hypothesized to be direct and statistically significant, and the relationship between disagreement and cohesion is also assumed to be direct and significant.

data are not amenable to χ^2 tests of significance.¹³ The relationships were examined for each category of referendum to determine how much patterns of municipal conflict vary according to the policy content of local ballot issues. The associations between residential location and social-class electoral cohesion are presented in this first table.

Perhaps the most striking finding in Table 1 is the consistency in the association between location and cohesion. In each referendum the direction and strength of the statistical associations remain essentially unchanged. Those cities with a high degree of spatial segregation (whose class groups are ecologically isolated) tend to have classes with high electoral cohe-

Associations between the residential location of social-class groups and social-class electoral cohesion, between residential location and electoral disagreement, and between electoral disagreement and electoral cohesion were tested for statistical significance utilizing Fisher's Exact Test. This statistic is useful in the instance of bivariate tables where N is small and the

sion. Conversely, the spatial integration of class groups is significantly associated with the development of low electoral cohesion within classes. Although examination of Table 1 reveals variation by referendum type in the pro-

portion of cities that display high electoral cohesion, this cohesion may be explained primarily by the spatial segregation of the class groups within those communities.

The findings in this table appear to be consistent with previous appraisals of the effects of residential segregation upon group cohesion. In general, segregated residential areas are thought to provide the physical contiguity for group cohesion and loyalty.¹⁴ Studies indicate that if citizens move into neighborhoods inhabited by people of similar class, this demographic homogeneity is influential in the development of psychosocial homogeneity.¹⁵ Similarly, other studies suggest that the class groups that are residentially located in homogeneous and segregated neighborhoods display distinctive group standards.¹⁶ Distinctive group standards may also affect the electoral cohesion of classes in voting in local referenda. The distributions in this first table confirm that residential segregation is associated with the presence of electoral cohesiveness and solidarity.

Since residential location may also affect the development of intergroup disagreements and friction, the residential location of class groups was statistically related to the degree of electoral disagreement between class groups. The associations are presented in Table 2.

¹⁴ Beshers, *Urban Social Structure*, p. 122.

¹⁵ Robert C. Tryon, *The Identification of Social Areas By Cluster Analysis* (Berkeley: University of California Press, 1955), p. 8.

¹⁶ Beshers, p. 111.

The patterns evident in Table 2 confirm that residential location significantly influences the amount of electoral disagreement between classes. Communities with segregated class groups display more electoral friction between classes than do integrated communities. Interestingly, the significant association was not found to fluctuate by referendum—a finding that is consistent with the analysis in the first table. The strong positive association between segregation and intergroup disagreement supports the inferences of the model, and in addition, may provide evidence to resolve some of the apparent contradictions of previous studies.

Several scholars have argued that intergroup conflict is a product of the spatial integration of incompatible groups. Physical proximity, they claim, may increase the probability of interaction which normally results in hostility and conflict between groups with distinctive standards.¹⁷ Additional studies have noted that spatial integration brings about increased accessibility between unlike groups, which produces intergroup frictions.¹⁸ Others speculate, however, that conflict between groups is influenced by residential segregation, leading to a decrease in interaction and communication, which further isolates groups.¹⁹ The speculation linking spatial integration to conflict and intergroup

friction does not seem to be supported by the findings in this table, and therefore, may need qualification. Residential segregation appears to actually increase interclass disagreement rather than lower disagreement. Apparently, the association posited in the model between residential location and interclass electoral disagreement is confirmed by the data in Table 2.

The association between disagreement across class groups and electoral cohesion within them is imputed to be mutual and symmetrical. Analysis reveals that for all referenda, most of the cities that manifest high electoral disagreement between classes also display high electoral cohesion within class groups. This disagreement is not posited to cause cohesion because each variable is presumed to occur simultaneously. The more interclass disagreement exhibited in a city, the higher is the electoral cohesiveness, but if cohesion is taken as the independent variable, the higher the cohesion, the higher the disagreement becomes.

Although disagreement and cohesion are symmetrically related, it is easier to focus upon the influence of disagreement upon cohesion. The association has been found to be moder-

ately, but not statistically, significant. To ascertain whether or not the relationship may be real and not spurious, Table 3 presents the associations between disagreement and cohesion controlling for residential location. If the association is indeed spurious, i.e., if the two variables depend upon residential location for their value, rather than upon each other, then the moderate positive relationship between high interclass disagreement and high social-class electoral cohesion will be invalidated.

Analysis of Table 3 indicates that the association may, in fact, be spurious, because whatever the level of class disagreement, the residential location of class groups exerts strong influence upon cohesiveness. In each referendum, cities with spatially segregated class groups display high electoral cohesiveness irrespective of the degree of interclass electoral disagreement. It is also evident that spatially integrated communities generally possess low electoral cohesiveness uninfluenced by amount of electoral disagreement.

These conclusions suggest that the original model needs reformulation. Reliance upon Fisher's Exact Test indicates that the associa-

tions between location and cohesion, and location and disagreement are direct and statistically significant. As Table 3 reveals, the relationship between disagreement and cohesion may be spurious. Since residential segregation has been shown to affect cohesion and electoral disagreement, any association between cohesion and disagreement is significantly affected by the residential distribution of class groups.

These conclusions have been drawn from an analysis of social-class groupings within cities. Social-class segments constitute a useful and appropriate unit of analysis when attempting to draw inferences about the distribution and co-

areas of a city will display fewer electoral differences between themselves than do precincts of the same class when they are located in integrated areas. Precincts in these highly dissimilar, or integrated, areas will manifest a high degree of electoral disparity because the electoral cohesiveness associated with segregated areas is not developed. As the spatial distance increases between similar classranked precincts, the likelihood that these precincts will be located in residentially segregated sectors of a city will also tend to decrease, thereby raising the level of electoral disparity. The following relationship may be inferred from these hypotheses.

GEOGRAPHICAL DISTANCE BETWEEN PRECINCTS

SOCIAL-CLASS DISSIMILARITY
BETWEEN PRECINCTS

BETWEEN PRECINCTS

hesion of class groups. The utilization of class groups within cities as the unit of analysis, however, limits the number of observations under investigation and may increase the probability of error. A more specific level of analysis may provide the opportunity to examine additional hypotheses related to location and urban electoral behavior.

The study of precinct voting patterns furnishes the occasion for investigating spatial location and electoral cohesion on a more precise scale, and with an increased number of observations. It is the purpose of this inquiry to determine if the patterns evident in the prior model are supported by investigation at a different level.

Two hypotheses are presented for scrutiny: (1) Precincts displaying high social-class dissimilarity will tend to display high electoral disparity. Dissimilarity is a measure of the amount of class difference between a given precinct and all of its contiguous precincts. Disparity refers to the degree of electoral difference (defined as the percentage of the vote in favor of the referendum) between precincts of the same class rank, irrespective of their location within a city. (2) Precincts revealing high distance scores will tend to exhibit high electoral disparity. A distance score is a measure of the average geographical distance between a precinct and all other precincts of the same class. It is an indicator of the geographical dispersion of similarly ranked precincts.

The logic of these hypotheses is that precincts of the same class arranged in segregated

Social class dissimilarity and geographical distance occur simultaneously, but there is no theoretical ground for assuming any causal relationship, even though a weak relationship is evident upon examination of correlation matrices. Class differences (dissimilarity) do not logically produce a situation of increased geographical distance between precincts of the same rank, nor does the reverse pattern occur. This model posits that both dissimilarity and distance independently produce disparity. Table 4 presents the Kendall coefficients of correlation (τ) between these variables. Kendall coefficients are used because dissimilarity is an ordinal measure, and assumptions of normality cannot be inferred.²⁰

The finding most evident in Table 4 is that the coefficients between social-class dissimilarity and electoral disparity are generally of a high magnitude. As precincts increase in the amount of social-class dissimilarity they possess, they also display more electoral disparity between themselves and other precincts of the same class-rank. Interestingly, the coefficients between distance and disparity are also significant, but of a slightly lower magnitude than the associations between dissimilarity and disparity. Precincts revealing high distances between themselves and other similarly class-ranked precincts tend to manifest high levels of electoral disparity (voting difference between similar precincts). The data seem to indicate that the hypothesized relationships do exist, but that the strengths of relationships vary.

To determine if the relationship between dissimilarity and disparity is spurious, and if it is largely through the geographical distance between precincts that dissimilarity influences high disparity, partial rank-order coefficients of correlation (tau) between dissimilarity and disparity are calculated controlling for distance.

The results of this partialling are presented in Table 5. When dissimilarity and disparity are correlated controlling for distance, the strong association is somewhat reduced and modified but not eliminated. The conclusion drawn from this finding is that the relationship is not spurious.

* Controlling for Dissimilarity.

The association of distance and disparity is also tested for spuriousness in Table 5 to ascertain the effect of dissimilarity upon the relationship. Examination of Table 5 indicates that the partial coefficient of correlation between distance and disparity is significantly reduced and almost eliminated. Usually, if the introduction

of a third variable into a partial correlation eliminates or reduces the original correlation, it may be inferred that the original relationship was spurious if the third variable, i.e., dissimilarity, occurred prior in time to either of the other variables. In this instance, however, distance and dissimilarity occur simultaneously;

therefore, the conclusion may be that the manner in which distance modifies disparity has been traced.²¹

In summary, distance alone does not cause disparity to vary, but rather, high dissimilarity provides the conditions under which the increasing distance between precincts produces high disparity. These findings generally support the conclusions previously developed that social-class electoral cohesion is associated with the residential location of social-class groups. The strength of the association between the social-class dissimilarity of precincts and the electoral disparity between precincts confirms the previous findings. Moreover, the hypothesized association between residential arrangements of class groups and class electoral cohesion has been supported by two levels of empirical investigation.

Summary and Conclusions

Ecologists have theorized that there is a geographical basis upon which human behavior depends and some have studied how the spatial relationships of humans have been affected by a variety of forces in the urban environment.²² To determine if the geographical distribution of social-class groups in a city has influenced the intensity of political conflict between classes, this paper has examined class voting responses to five types of referenda.

Those communities in this study that contained spatially segregated social-class groups also exhibited high social-class electoral cohesion and solidarity. Those groups located in areas of the city with few class differences appeared to have a commonality of voting behavior. Class groups not located in homogeneous areas did not exhibit this solidarity. In those cities, however, that had geographically fragmented classes with few segregated areas, the electoral cohesion of each class was low. A social-class group located in an area of wide class dissimilarity was likely not to vote in concert

with other groups of the same social class located elsewhere in the city. The geographical separation of precincts of the same class would appear to produce voting behavior that is not uniform or consistent within that class group.

The segregation of population groups may tend to fuse neighborhood sentiment together. The adherence to common values and attitudes within each group is mirrored in the cohesiveness in voting by the groups within the area. Apparently certain areas in a city attract groups that come to possess similar political viewpoints. That this process of mutual attraction occurs seems to be indicated by the low variation in voting within residentially segregated areas of cities.

Interestingly, the cohesiveness of class groups was not affected by the type of issue voted upon by the residents of the city. Presumably distinct referendum issues, which appear to exhibit different policy contents, would elicit varying responses from the electorate. The analysis indicated, however, that each referendum type was associated with similar patterns of class cohesion.

Although location influenced intraclass cohesion, the spatial patterning of classes in each city also affected the level of disagreement between class groups. Communities with segregated classes exhibited a high degree of social-class cohesion and solidarity. Conflict theorists have contended that such a situation may create intense intergroup conflict. The findings of this paper, however, did not fully confirm those assertions. Instead, interclass disagreements appeared to be associated more with the geographical distribution of class groups than with class solidarity. Those cities that displayed segregated social-class groups also manifested higher levels of interclass disagreements than those social class groups in spatially integrated communities.

In summary, ecologists have contended that location is important in determining the behavior of population groups; the conclusions of this paper seem to support these contentions. Although this study is somewhat limited in scope, the findings indicate that the theoretical contributions of human ecology may be helpful in explaining certain patterns of local politics and the conflicts that shape them.

The Politics of Redistribution: A Reformulation*

BERNARD H. BOOMS

The Pennsylvania State University

AND

JAMES R. HALLDORSON

F. W. Woolworth Company, Tax Department

Fry and Winters introduced a new dimension of public policy output analysis in a recent article published in this *Review*.¹ In many ways their effort is a truly groundbreaking endeavor. It is imaginative, innovative and raises several important questions. As we shall suggest in the following analysis, however, the techniques Fry and Winters employed, while appropriate, were misused in several ways. After reformulating their analysis, we have found that the calculated values of their redistribution index as well as the nature of their findings, change substantially.

Fry and Winters's study is concerned with two broad questions: 1) Does politics make a difference in public policy outcomes, and 2) How are certain factors (socioeconomic and political variables) specifically related to policy outcomes?

Fry and Winters contend that previous studies addressed to these questions were formulated to bias the results against political variables. They suggest that:

... prior findings have been the result of the examination of a measure of public policy in which the influence of the political system is likely to be negligible, that is levels of public revenues and expenditures. To examine this proposition empirically, our study shifts attention to the allocation of the burdens and benefits of state revenue and expenditure policies across income classes. In redirecting analysis to allocations rather than levels

of state revenues and expenditures, we focus on a province we believe to be more predictably political.²

Their alternative is to derive a new measure of public policy output:

We have taken as our dependent variable the net redistributive impact of revenues and expenditures as represented by the ratio of expenditure benefits to revenue burdens for the three lowest income classes in each state. The major hypothesis of our study is that, in regard to the allocation of the burdens and benefits of state government revenues and expenditures, political variables will have a stronger influence on policy outcomes than will socioeconomic variables.³

They raised the question of the impact of politics on public policy outcomes because most recent expenditure studies have suggested that political variables have little or no impact on policy outcomes.⁴ In particular, the results have shown that socioeconomic variables seem to be more strongly related to state revenue and expenditure levels than are political variables, although the results have varied by function.⁵ Given these findings, Fry and Winters state:

... The political analyst may have to look beyond levels of taxes and expenditures to find politics having an independent or dominant influence on policy outcomes in the states. ... As Key originally

³ Fry and Winters, p. 508.

⁴ This literature starts with Richard E. Dawson and James A. Robinson, "Inter-Party Competition, Economic Variables and Welfare Policies in the American States," *The Journal of Politics*, 25 (May, 1963), 265-289. Fry and Winters provide a concise review of the literature. For a critique of the literature in this field see, Joan B. Booms and Bernard H. Booms, "A Critique of Recent Public Policy Output Studies," unpublished paper, The Pennsylvania State University, 1972.

⁵ Fry and Winters, "The Politics of Redistribution," p. 510. Others have also pointed to the interesting fact that public welfare is the one function for which outcomes are least well accounted. See, for example, Peter S. Albin and Bruno Stein, "The Determinants of Relief Policy at the Sub-Federal Level," *Southern Economic Journal*, 37 (April, 1971), 446. Since public welfare is mainly a redistributive program, this finding suggests that redistributive elements of public policy are not well accounted for in previous studies.

* While this paper was being written, Mr. Halldorson was a Masters Degree candidate in the Department of Economics, The Pennsylvania State University. Michael R. King and Robert S. Friedman of the Political Science Department offered their valuable comments and criticisms on earlier versions of this paper. The authors gratefully acknowledge their help. Special thanks are also due Joan B. Booms, and our colleagues in the Economics Department, Teh-wei Hu, D. Lynne Kalreider, and James D. Smith for their interest and help. Stuart Scantlebury provided essential computation assistance. Special mention needs to be made of Richard F. Winters's open willingness to discuss the techniques he and Brian R. Fry used in their study and to provide the authors with some of the data used in their study.

¹ Brian R. Fry and Richard F. Winters, "The Politics of Redistribution," *American Political Science Review*, 64 (June, 1970), 508-522.

hypothesized, a fruitful area of search for such influence may be the redistributive policies of state governments.⁶

Public policy studies to date have been concerned with the allocation dimension of public policy, i.e., *how much* is provided for what program or function. In other words, research has emphasized the *levels* of resources allocated for alternative functions, implying that most public programs can be considered primarily allocative in nature. This view seems somewhat unrealistic. Obviously, public assistance is aimed purposely at redistribution within society, but most other public functions are not specifically designed for redistribution, but rather for the provision (allocation) of services that either would not be produced by the private sector because of total market breakdown, or would be underproduced because of partial market failure.⁷

Few, if any, of these allocation programs, however, are neutral in distribution impact. "Even programs that apparently benefit most of the population—such as education and highway construction—have a variable incidence of benefits."⁸ So virtually all government programs contain an element of redistribution. Fry and Winters suggest that a look at the redistributive aspects of allocation should constitute a new focus for research because it is here that politics may play a central role.

We add that it is important to study redistribution effects because they are an important determinant of the quality of life for many people in our society. The allocation of public burdens and benefits is a major point of conflict in our society. It is obviously advantageous to know something about the factors influencing the distribution of public outcomes.

Incidental to this concern of knowledge for policy purposes is the question of whether political, socioeconomic, historical, or geographical variables are more helpful in studying this question. *A priori* Fry and Winters's contention that political variables should be most important in determining the distribution of output seems reasonable. While the *level of funds*

spent seems more likely to be a function of ability-to-pay factors such as income, *who pays* and *who benefits* from a *given* level of operation may lie more in the realm of politics. It might be hypothesized that political forces design the program and influence its administration.⁹

Fry and Winters's Method

Fry and Winters sought to measure the "net redistributive impact of revenues and expenditures" in each state expressed as a ratio of expenditure benefits to tax burdens for the lowest three income classes.¹⁰ The process by which these ratios were derived was adapted from a Tax Foundation Study (1967).¹¹ The purpose of that study was

to provide broad estimates of (1) the total tax burden—Federal and state-local—on families and unattached individuals by income class and major type of tax, and (2) the benefits of government expenditures by major groups of programs.¹²

Bases of allocation were assumed for each major tax and expenditure category in order to explain the incidence of burdens and benefits to families in each income class. The statistical bases of allocation used by Fry and Winters were taken from the Bureau of Labor Statistics (BLS), *Survey of Consumer Expenditures 1960–1961*¹³ which reported families' average dollar expenditures and average dollar income receipts for specific expenditure and income categories by income class. In this study (BLS) expenditures and income were reported for the entire nation for both urban and rural families. Fry and Winters adapted these data to determine the percentage distribution of tax burdens and expenditure benefits for each income class by state.¹⁴

⁹ John P. Crecine presents some evidence which tends to support these statements. His results seem to indicate that level of expenditures and revenues is, in the short run, relatively immune to political pressure. He concludes that political pressure and influence are more likely to affect whose street gets repaired, and how much is spent per pupil at a school, rather than the level of the total street repair or school district expenditures. See John P. Crecine, *Government Problem Solving: A Computer Simulation of Municipal Budgeting* (Chicago: Rand McNally, 1969).

¹⁴ For example, it was assumed that expenditures for automobile operations served as the basis of allocation

⁶ Fry and Winters, p. 510.

⁷ See Richard A. Musgrave, *The Theory of Public Finance* (New York: McGraw-Hill, 1959), for a discussion of the distinction between the allocative and distributive functions of government, and a definition of public outcomes based on the performance of the market.

⁸ Herbert Jacob and Michael Lipsky, "Outputs, Structure, and Power: An Assessment of Changes in the Study of State and Local Politics," *Journal of Politics* (May, 1968), 515, cited in Fry and Winters, "The Politics of Redistribution," p. 510.

The Tax Foundation considered each revenue and expenditure category for the federal and state-local levels of government. The bases of allocation were then applied to the aggregate total amounts collected and expended by each level of government to determine the expenditure benefits and tax burdens for each income class for the entire nation. It is important to note that the statistical bases of allocation were adapted from national averages for expenditures and income, and referred to a *national distribution of families by income classes*.

Fry and Winters adapted directly the method used in the Tax Foundation study to determine the distribution of benefits and burdens for states' expenditures and revenues by income class for each state. To do this Fry and Winters assumed those bases of allocation from the Tax Foundation study that were applicable to state government expenditures and revenues (see Tables 1 and 2). They also adapted the same statistical bases of allocation used by the Tax Foundation and converted them into percentage amounts to explain the percentage distribution of burdens to benefits by income class for each expenditure and revenue category. Because they assumed the statistical bases of allocation from the Tax Foundation study, they used one set of percentages for the distribution of revenue burdens and one set for expenditure benefits. These two sets of percentages were then applied to each state's expenditures and revenues to determine the actual amount of tax burdens and expenditure benefits by each income class for each state. They then summed the amount received as expenditure benefits,

and the amounts spent as tax burdens for each state for the lowest three income classes, i.e. those with an income under \$4,000. Finally, they expressed these amounts as a ratio of expenditures to revenues in each state.

Critique of Fry and Winters's Methods

This technique, which should yield a meaningful approximation of the distribution and benefits from the public sector, is not problem-free. Fry and Winters acknowledge this, citing some of the "problems"—the necessity of selecting somewhat arbitrarily the allocation bases from which they constructed their indices, and the assumption that the consumption pattern of a given income group does not vary from state to state.¹⁵ This latter assumption results from the lack of Bureau of Labor Statistics data on a state-by-state basis. Fry and Winters thus necessarily assume that people in the \$3,000 to \$3,999 group (regardless of the state in which they reside) spend the same percentage of their income on the allocation bases commodities (e.g., cigarettes, automobile operation). While this is clearly not true for all goods, the items used here for assigning benefits and burdens to an income class are universal American consumption items. Thus this assumption seems realistic.

The above-cited problems do not invalidate their calculations and results; however, Fry and Winters make some errors in using the technique which *do* seem to destroy much of the value of their work and cast doubt on their results. We will discuss these errors, describe our reformulation and then compare the Fry and Winters findings with our own.

The *major* error committed by Fry and Winters in deriving their redistribution index is their application of the Tax Foundation's calculated distributions of expenditures and revenues (which refers to the U.S. as a whole) to each state. The Tax Foundation used expenditures by each income class as a percentage of the total; in doing this, they validly based their work on national figures for the number of families in each income class as reported by the Bureau of Labor Statistics. *But* this procedure should not be followed when developing separate state-by-state estimates of redistribution, since the number of families in each income class varies widely across the states.

Fry and Winters adapt the bases of allocation used by the Tax Foundation in order to explain the distribution of tax burdens and expenditure benefits by income class. The Tax

for motor vehicle taxes. The average amount spent for automobile operations in each income class was multiplied by the number of families in that income class to determine the total amount spent by each income class for automobile operations. This amount was summed across income classes to determine the amount spent by all families in all income classes. The amount spent by each specific income class was then taken as a percentage of that total. If the families in the income class of \$15,000 and over accounted for 10 per cent of all automobile operation expenditures, they were allocated 10 per cent of the burden for Motor Vehicle taxes. Similarly, on the expenditure side, it was assumed that benefits of government highway expenditures were allocated to each income class according to one-half its expenditures for automobile operation and one-half its expenditures for total current consumption. The same process was repeated to determine the percentage of the total amount spent for automobile operation and total current consumption by each income class. If the income class of \$15,000 and over accounted for 12 per cent of expenditures for total current consumption and 8 per cent of expenditures for automobile operation, they would then be allocated 10 per cent of the benefits for government highway expenditures.

¹⁵ Fry and Winters, pp. 514–515.

Table 1. Bases of Allocation for State Government Expenditures

Expenditure Category	Basis of Allocation
<i>Direct Expenditures</i>	
Education	
Elementary and Secondary	Number of children under 18.
Higher and Other	Higher education expenditures.
Highways	Half automobile operation and half total current consumption.
Public Welfare	Income from public social assistance and private relief.
Agriculture	Farm money income before taxes.
Insurance Trust	Public unemployment and social security benefits.
Interest	Interest income.
Other—General	Half money income before taxes and half number of families and unrelated individuals.
<i>Intergovernmental</i>	
Education	Half number of children under 18 years of age and half higher education expenditures.
Highways	Same as Direct Highway Expenditures.
Welfare	Same as Direct Welfare Expenditures.
General	Same as Direct General Expenditures.

Foundation took the average amount spent or received in each category as reported by the Bureau of Labor Statistics and multiplied it by the number of families in each income class and summed these amounts across classes to determine the amount spent or received by all income classes for each category for the country as a whole. Fry and Winters took this amount spent by each income class, and expressed it as a percentage of the total amount spent by all income classes. These figures were assumed to express the proportion of burdens and benefits allocated to each class. The single set of percentages, derived as it was from national distributions, was then applied by Fry and Winters to each state's revenues and expenditures to determine the amounts spent and received by the income classes in each state.

This method of index construction is inappropriate because it is derived from percentages based on a *national* distribution of families by income class (from the Bureau of Labor Statistics' study). The proportion of families in each income class obviously varies from state to state.¹⁶ Consequently, the application of these percentages to each state's revenues and expenditures erroneously assigns burdens and benefits to income classes. For example, if on the na-

¹⁶ An examination of 1960 Census data proves that the distribution of families by income class does vary significantly from state to state. As an illustration, the national percentage of families and unattached individuals in the income class of \$3,000 to \$3,999 is 11.0 per cent as reported by the BLS. According to 1960 Census data, the percentage of families who earn from \$3,000 to \$3,999 varies from 6.2 per cent in Connecticut to 14.3 per cent in Maine.

Table 2. Bases of Allocation for State Government Revenues

Revenue Category	Basis of Allocation
<i>Taxes</i>	
Sales and Gross Receipts	
Alcoholic Beverage	Alcoholic beverage expenditures.
Tobacco	Tobacco expenditures.
Motor Vehicle	Automobile operation expenditures.
All Other	Total current consumption.
Individual Income	Personal taxes.
Corporation	Half total current consumption and half dividend income.
Property Tax	Half total current consumption and half housing expenditures.
Death and Gift	Completely to the \$15,000 and over income class.
All Other	Total current consumption.
Social Insurance Contributions	Combination of social security, railroad, and government retirement contributions and total current consumption.
Charges and Miscellaneous	Total current consumption.
Intergovernmental	Distribution of federal taxes.

tional level, the income class of \$15,000 or over spends 10 per cent of the total spent for automobile operation. Fry and Winters assign 10 per cent of the burden for Motor Vehicle taxes to this income class in each state. But in some states, the proportion of families who make \$15,000 or more is, for example, less than the national average, and thus in those states this income group accounts for less than 10 per cent of the total spent on automobile operation expenditures. By Fry and Winters's method this income class would be allocated 10 per cent of the burden of motor vehicle taxes in each state no matter what the distribution of families who earn \$15,000 or more is in that state.

A less serious error is Fry and Winters's inclusion, as part of revenues to be allocated, of those connected with the sale and consumption of alcoholic beverages. In 16 states liquor retailing is limited by law to state owned monopoly liquor stores. The revenue from these stores is correctly included by Fry and Winters as an item of burden to be allocated. However, Fry and Winters also include purchases by state liquor stores for resale as an item of benefit to allocate and thus as a factor in calculating their output measure. There seems to be no clear rationale for doing this. Not since prohibition have federal or state governments decreed the amount of liquor *purchases*. Purchase amounts are not the subject of public policy. Also, since the official figures on liquor store expenditures reflect total price, i.e., both price of item and tax, and since only figures for states with government monopoly on sales are collected, an unknown bias is introduced into the calculation of the redistributive index. The extent of this bias must be investigated, or the calculations corrected, before the redistribution measure can be accepted as actually measuring what it is purported to measure. In reformulating a redistribution index, we correct for Fry and Winters' handling of revenues and benefits allocated on the basis of the sales of alcoholic beverages, by excluding liquor store expenditures from consideration.

The Method of Reformulation

To provide a measurement of distribution of the tax burdens and expenditure benefits on a state-by-state basis, it would be ideal to have data on consumer expenditures and income by income class for each state. Unfortunately, the extensive study done by the BLS is the only one that provides sufficient figures of families' expenditures and income by income-class. As mentioned above, due to the sampling

method that study does not provide data on a state-by-state basis.

It is the purpose of the reformulation to adapt the national figures provided by the BLS for a state-by-state analysis. Instead of using one set of national averages for the number of families and single consumers in each income class, as Fry and Winters did, the reformulation accounts for the distribution of families and single consumers by income class in each state.

The reformulation employs seven equations that determine the distribution of burdens (benefits) for each category of revenues (expenditures) to each income class, as well as the redistribution of income. The reformulation determines burdens and benefits, along with the redistribution ratios, for each category of revenues and expenditures, for each income class, in each state. (See Appendix 1 for equations.)

The first equation considers the BLS categories of expenditures and income that serve as the bases of allocation for the corresponding categories of state expenditures and revenue. (See Tables 1 and 2 for bases of allocation.) The average amount spent (received) by each income class for each BLS category is divided by the average money income before taxes for each income class. The average amount spent (received) for each BLS category is presented as a percentage of the average money income before taxes for all nine income classes.

The second equation derives the aggregate total money income before taxes for all families and unattached individuals in each income class for each state. The *distribution* of families and unattached individuals, by income class in each state is accounted for here, thus overcoming the major error of the Fry and Winters study.

The third equation derives the average dollar amounts of expenditures and income for each category that serves as a basis of allocation to the corresponding categories of state revenues and expenditures.

The fourth equation sums the average dollar amounts of expenditures (income) across all nine income classes. Each individual income class is then taken as a percentage of this total.

The fifth equation derives the actual dollar amount of burdens for state government revenues and benefits of state government expenditures for each income class in each state.

The sixth equation sums the dollar amount of benefits for all twelve categories of expenditures, for each income class, as well as the burdens for all twelve categories of revenues for each income class in each state.

The final equation derives the ratio of redis-

tribution for the lowest four income classes, i.e., those earning less than \$4,000 by dividing total expenditure benefits received for the lowest four income classes by the revenue burdens paid out for the same income classes.

A Comparison of Results

We now turn to the relationship among our index of redistribution, that of Fry and Winters, and facets of the social, economic, and political structure of the states. Our results are presented in the same manner as Fry and Winters's in order to facilitate comparisons.¹⁷

Table 3 gives the redistribution ratios for the subject states. A rank ordering of the states according to each version of the index is also provided. It is obvious the absolute values of the two versions of the index differ greatly, and the rank ordering shifts significantly. (The simple correlation between the two indices is .63.) These discrepancies seem to indicate that our revision is an important change. The errors we discussed above appear to have more than just academic import.

To check for further differences between the two approaches, a state-by-state comparison would be ideal. Unfortunately, such a direct comparison is not possible since Fry and Winters do not list the figures on the amount of burdens and benefits for each state. One possible means of comparison, however is to examine the single set of percentage distributions presented by Fry and Winters and the percentage distributions for *each* state obtained in the reformulation, but not presented here because of space limitations. Such a comparison bears out the thesis of the reformulation. For example, the percentage allocation for the burden of motor vehicle taxes for the income class of \$3,000 to \$3,999 is 8.2 per cent according to Fry and Winters's methods, while the percentages yielded by the reformulation ranged from 1.7 per cent in Idaho to 12.6 per cent in Arkansas for the same category and the same income class. Similar striking differences were found for most categories and income classes.

After constructing their index of redistribution, Fry and Winters proceeded to test several basic hypotheses regarding the factors associated with redistribution. The results of these tests are found in Table 6, Summary of Findings, in their article. For purposes of comparison and illustration only, we carried out identi-

¹⁷ The error of assuming a uniform income distribution among states made it possible to use only two tables, one for burdens, the other for benefits. Our technique yields two such summary tables for *each* state so it is impossible to include these summary tables.

cal tests using the reformulated version of the dependent variable.

It should be pointed out there are some statistical problems with the method Fry and Winters used to test their hypotheses. The most ob-

vicious problem is one of multicollinearity.¹⁸ The existence of heavy multicollinearity still yields unbiased estimates for the regression coefficients but inflates their standard errors. This, in effect, lowers the chance of a variable's being

¹⁸ See comment by James J. Noell and reply by Fry and Winters. *American Political Science Review*, 64 (December, 1970), 1249-1251. An unknown referee pointed out a problem that neither Noell nor we mention, viz., that caution should be used in choosing which income variables to include as independent variables, since the dependent variable is in part income-defined. Obviously it would be meaningless to regress a variable on its own constituent parts.

statistically significant and thus may lead to improper assumptions concerning the absence of correlation between the dependent variable and specific independent variables. In essence, the danger is not of erring in favor of finding a statistically significant correlation when one does not exist, but, rather, of missing true correlation linkages.

Noell states without specific evidence that multicollinearity exists in the Fry and Winters regressions. Our efforts provide evidence to prove this allegation. A test of orthogonality on the determinate of the correlation matrix of in-

dependent variables showed values of .0000000069 and .0000001525.¹⁹ Since a value of unity means no multicollinearity, and a value of zero indicates the matrix is singular, or perfect multicollinearity exists, problems of multicollinearity are obviously present.

There are also some difficulties in interpreting Fry and Winters's presentation of their find-

ings. No measure is provided of the impact that a change in each variable has on the dependent variable (other things constant). Regression coefficients, which provide a quantitative measure of these impacts, are useful for judging the potential impact of alternative policy changes or outcomes. Regression coefficient values as well as beta coefficient values are presented in Table 4. Beta coefficients can be used to measure the importance of individual explanatory variables for the calculated value of the dependent variable, just as partial correlation coeffi-

¹⁹ For a description of this test, see Donald E. Farrar and Robert R. Glauber, "Multicollinearity in Regression Analysis: The Problem Revisited," *Review of Economics and Statistics*, 49 (February, 1967), 92–107.

cients are used for this purpose.²⁰ This measure provides an alternative method for comparing the relative importance of variables in "explaining" the dependent variable. Note that the regression coefficient is inappropriate for this purpose, since the size of the coefficient can be changed by changing the units of measurement for the variable. Regression coefficients show the degree of impact, not degree of correlation. For these reasons, we have computed regression and beta coefficients in addition to the various correlation techniques used by Fry and Winters. The results are presented in Table 4. In interpreting the table, one should bear in mind that while the zero-order and partial correlation coefficients allow one to make statements about the degree of association among variables, the regression coefficient gives a quantitative measure of the impact of changes in the independent variable on the dependent variable. As was indicated above, this statistic allows for judgements regarding proposed policy changes. It also points to what might be altered if significant changes in redistribution are desired.²¹

Table 4 shows major differences between our results and those of Fry and Winters. Several are particularly interesting. Note that by reformulating the redistribution index, we have raised considerably the relative explanatory power of the socioeconomic variables (from .17 to .56 for the multiple coefficient of determination, and from .39 to .53 for the multiple-partial coefficient of determination). More significantly, we find that the amount of explained variance between all 48 states and the non-South states (Table 5) is very nearly identical (.84 and .87), contrary to Fry and Winters's results (.55 and .67). This finding tends to make Fry and Winters's lengthy explanation of South vs. Non-South differences less meaningful.

Also interesting is that the relationship between interparty competition and redistribution changes direction. Contrary to Fry and Winters's own findings, when our index is related to

competition, the data support the original Fry and Winters hypothesis; namely, that competition leads to greater redistribution.

The primary purpose of this paper was to reformulate a redistribution index for the impact of state government activities on the incomes of individuals and to show how such a reformulation was important because it yielded results significantly different from those originally obtained by Fry and Winters. The above regression analysis was carried out for comparison purposes only. In addition to the few specific comparisons made here, others could be made and important hypotheses tested; this work however awaits more appropriate analytical techniques.

APPENDIX I

Methodological Appendix

Presented below are the seven equations that were used to determine the distribution of burden (benefits) for each category of revenues (expenditures) to each income class as well as the redistribution of income. (See pp. 928 and 929 in text for a discussion of these equations.)

Equation 1:

$$P_{ih} = \frac{(\bar{C}_{ih})}{\bar{Y}_i}$$

P_{ih} = Percentage of money income before taxes spent (received) for BLS categories of expenditures and income that serve as bases of allocation

h = Bases of allocation that correspond to state expenditure and revenue categories.
 h from 1 to 24

i = Income classes. i from 1 to 9

\bar{C}_{ih} = Average dollar amounts of expenditures and income for bases of allocation

\bar{Y}_i = Average money income before taxes

In some cases the BLS categories had to be combined. Therefore,

$$(\bar{C}_h), \left[\bar{C}_h = \sum_{i=1}^9 \bar{C}_{ih} \right]$$

represents the BLS categories or combination of categories that serve as the bases of allocation for the corresponding categories of state revenues and expenditures. The values of both (\bar{C}_h) and (\bar{Y}_i) were taken from the same BLS study used by the Tax Foundation and Fry and Winters.²²

²⁰ See Arthur S. Goldberger, *Econometric Theory*, John Wiley, New York, 1964, pp. 197-198. A note of caution is in order here. The fact that beta coefficients are themselves statistics is often overlooked by researchers. Before any meaning can be attributed to a beta coefficient, one must test whether it is significantly different from zero. Likewise, in comparing the magnitudes of beta coefficients, one should test for a statistical significance difference between the two beta coefficients. See Teh-wei Hu, "Beta Coefficients Used in Statistical Inference," unpublished paper (The Pennsylvania State University, 1971).

²¹ Note also that indications of statistical significances are given for the regression coefficients, making possible an evaluation of the reliability of these estimates.

²² The values of (C_h) for the category of elementary and secondary education were not included in this formula. The basis of allocation for this category is the

Equation 2:

$$T_{ij} = (M_{ij}) (\bar{Y}_{ij})$$

T_{ij} = Total aggregate money income before taxes for all families and unattached individuals

j = State, j from 1 to 48

M_{ij} = Number of families and unattached individuals

\bar{Y}_{ij} = Average money income before taxes

The values of (M_{ij}) were taken from the 1960 census.²³

Equation 3:

$$A_{ijh} = (P_{ih}) (T_{ij})$$

A_{ijh} = Average dollar amount of expenditures (income)

P_{ih} = Percentage of money income before taxes spent (received)

T_{ij} = Total aggregate money income before taxes for all families and unattached individuals

This step recalculates the values of (C_{ih}) for each individual state. The values of (A_{ijh}) take into account the difference in the distribution of families and unattached individuals, by income class, from state to state.

Equation 4:

$$a_{ijh} = \frac{A_{ijh}}{\sum_{i=1}^9 A_{ijh}}$$

a_{ijh} = Percentage of expenditures (income) spent (received) by each income class in relation to the total amount spent by all nine income classes

A_{ijh} = Average dollar amount of expenditures (income)

number of children under 18 years of age for each family. The values of (P_{ih}) for this category were taken directly from the BLS study.

²³ U.S. Bureau of the Census, *U.S. Census of the Population: 1960, Vol. 1, Characteristics of the Population* (Washington, D.C.: U.S. Government Printing Office, 1963), pts. 2-9, 11-52. A problem arises here since the income classes used by the BLS and those used by the Bureau of the Census do not coincide in all cases. To solve this problem, those income classes between \$6,000 and \$9,999 were lumped into one class. To combine the BLS data, weighted averages were taken (according to the number of families and single consumers in the income class to be combined) to determine the average amounts of income and expenditures for the income class of \$6,000 to \$9,999. For the Census data the classes were simply added together.

The values of (a_{ijh}) represent the percentage burden (benefit) of state government revenues (expenditures) allocated to each income class.

Equation 5:

$$BE_{ijk} = (a_{ijh}) (SE_{jk})$$

$$BU_{ijl} = (a_{ijh}) (SR_{jl})$$

BE_{ijk} = Dollar amount of benefits from state expenditure program

BU_{ijl} = Dollar amount of burden from state revenue program

k = Category of state government expenditure program

l = Category of state government revenue program

SE_{jk} = Dollar amount of state government expenditures

SR_{jl} = Dollar amount of state government revenues

The dollar amounts of state expenditures (BE_{jk}) and state revenues (BU_{jl}) were taken from the *Compendium of State Government Finances in 1961*.²⁴

Equation 6:

$$be_{ij} = \sum_{k=1}^{12} BE_{ijk}$$

$$bu_{ij} = \sum_{l=1}^{12} BU_{ijl}$$

be_{ij} = Total dollar amount of benefits for all categories of state expenditures

bu_{ij} = Total dollar amount of burdens for all categories of state revenues

BE_{ijk} = Dollar amount of benefits from state expenditure program

BU_{ijl} = Dollar amount of burden from state revenue program

Equation 7:

$$r_j = \frac{\sum_{i=1}^4 be_{ij}}{\sum_{i=1}^4 bu_{ij}}$$

r_j = The ratio of redistribution for the lowest four income classes

be_{ij} = Total dollar amount of benefits for all categories of state expenditures

bu_{ij} = Total dollar amount of burdens for all categories of state revenues

²⁴ U.S. Bureau of the Census (Washington, D.C.: U.S. Government Printing Office, 1962).

Voting Systems, Honest Preferences and Pareto Optimality*

RICHARD ZECKHAUSER

Harvard University

"In a capitalist democracy there are essentially two methods by which social choices can be made: voting, typically used to make 'political' decisions, and the market mechanism, typically used to make 'economic' decisions."¹ To economists, the freely functioning competitive market mechanism has alluring structural properties.² If each individual follows his own self-interest in making his market decisions, an efficient outcome is achieved.

What of the possibility of constructing a voting mechanism that would achieve a collective political outcome that would have desirable properties that parallel those of the competitive market outcome? Can a voting system be impersonal and decentralized, allow each individual to act on his own behalf, and guarantee that a Pareto-optimal outcome will be achieved?³

* Kenneth Arrow, Robert Klitgaard, Pamela Memishian, Howard Raiffa, Thomas Schelling, Michael Spence, Milton Weinstein, and a referee for the *American Political Science Review* provided me with helpful comments. This research was supported by NSF grants GS-28626x and Gr-58.

¹ Kenneth Arrow, *Social Choice and Individual Values* (New York: John Wiley and Sons, Inc., 1964), p. 1.

² It is with some discomfort that I leave aside the problem of distribution in this paper. The issue is attacked directly in a later effort, "Risk Spreading and Distribution," Kennedy School of Government, Discussion Paper No. 10 (August, 1972). There I argue that a profound belief in the efficacy of the outcome of a perfect market gives one insights into distributional questions. One can consider the problem of drawing the social contract equivalent to that of a group of future citizens starting in some initial position of equal potential (they face the same lottery on future possibilities). They draw up a contingent claims agreement, the magnitudes of payment to depend on their future fortune in securing endowments of goods and capabilities (that is the states of the world). In retrospect, we may decide that it is our duty to redistribute in the manner that would be prescribed by the hypothetical agreement that antedated our present position. For a philosophically compatible, but perhaps policy inconsistent view, see John Rawls, *The Theory of Justice* (Cambridge, Mass., Harvard University Press, 1971).

³ Thomas Schelling has commented at great length, interpreting and questioning the significance of Pareto optimality as a criterion for social choices. He states, "the significance of failure to achieve Pareto-optimality merely means that the situation is improvable . . . it is the degree of improvability that determines how important the nonoptimality is. Pareto optimality is not like virginity or justice. . . . Small departures are of small interest, large departures are of large interest." Personal communication, July 12, 1972.

Economists have long recognized that Pareto optimality by itself is a hopelessly incomplete guide to normative and descriptive considerations of social choice. An indication of this author's response is given by the conclusion to this paper.

A Desirable Voting Scheme

In the market, an individual indicates his preferences through his purchases and sales. In general, these tracings are insufficient to define an individual's complete preference mapping, but from the standpoint of efficiency this creates no difficulties. With merely the limited amounts of information fed to it, the market leads to a Pareto-optimal outcome. (It should be noted that no individual has an incentive to disguise his preferences.)

A voting system in theory could operate in the same decentralized fashion. Each individual would feed in some indication of his preferences, and the processing mechanism would employ this information to yield an outcome. To see whether such a procedure should be established as an ideal, we must determine how it can perform along a number of significant dimensions.

Major Characteristics of Social Decision Procedures

The flow diagram below provides the context for the major topics discussed in this paper. (At a later juncture, it will serve to summarize its principal results.) These topics are indexed A through F.

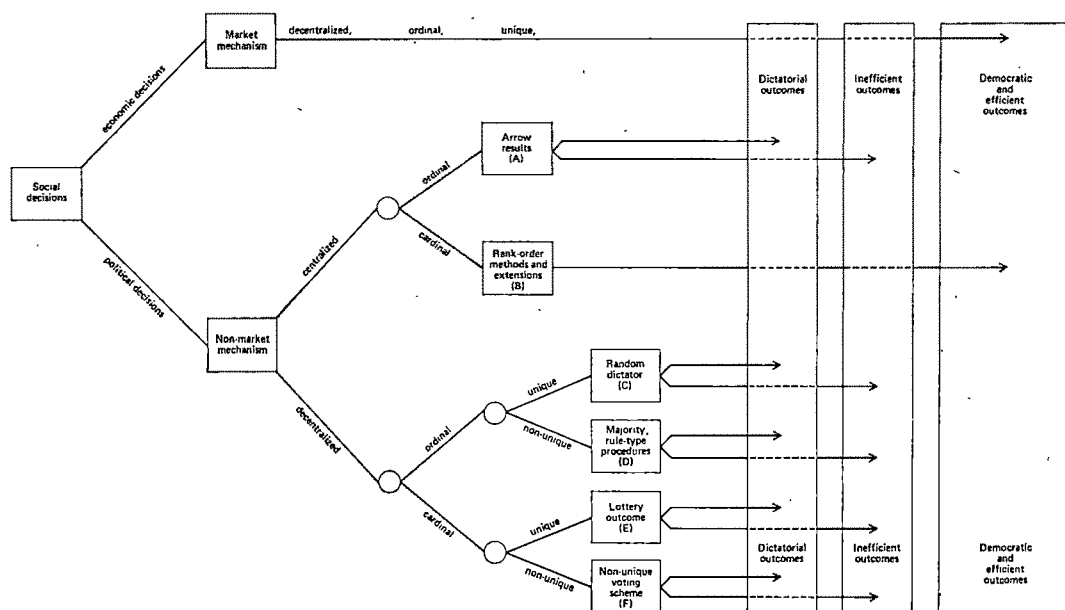

Social decision problems are first classed as economic or political. Economic decisions are handled by the market mechanism. Under the appropriate competitive conditions, the market outcome will meet some preassigned standards of acceptability. The principal standard to be met is efficiency. The measuring rod for this standard is Pareto optimality.

There are myriad situations in which the very restrictive competitive assumptions are not met. For these situations, much the subject of current economics debate, the unhindered play of the market will not lead to an attractive outcome. Perhaps the establishment of new areas of property rights, or innovative additions to present market mechanisms will set things right. Whatever, this is not material to the present discussion.

These situations would be of import for this paper if they were treated as political decisions. They then would be carried down the lower branch of the flow diagram, where they could serve as further exemplars for the analysis of that branch.

Political Decisions and the Individualist Approach

In evaluating outcomes in the economic arena,

Context and Summary Diagram

we rely on consumer sovereignty. Each individual is entitled to judge what is best for himself, and these individual judgments form the basis for assessments of social welfare. This paper carries over this individualist ethic to the evaluation of all social choices, including those that are conventionally considered to be of a political nature. Thus individuals' preferences form the basis for the social decisions considered here. In social decisions more than one individual is involved. Together, social decision and consumer sovereignty exclude from consideration any form of paternalistic rule.

The ground rules then are set. We are searching for a procedure that enables us to proceed from information on individuals' preferences to a social outcome that meets some conditions of acceptability. The ultimate objective is to discover a decentralized procedure, one which consciously or automatically takes the (perhaps incomplete) information provided by individuals' ballots and yields an acceptable social outcome.

Centralized Decision Procedures

For purposes of comparison, I shall begin with a look at the success or nonsuccess of centralized procedures. With centralized decision, a single decision authority with accurate knowledge of individuals' preferences selects an outcome.

Centralized Decision, Ordinal Preferences (A)

At first glance it would seem that centralized decision procedures hold out promise of great

success. Yet Kenneth Arrow, in a much celebrated work, has demonstrated that there is no general procedure to pass from individuals' preferences to social orderings that meets certain standards of attractiveness.⁴ The power of the Arrow result derives from the fact that the standards he imposed were both innocuous in appearance and intuitively appealing.

Arrow sets forth four standards. In unrigorous language, they are: (1) The procedure must include all logically possible combinations of individuals' orderings. (2) It must lead to Pareto-optimal outcomes. (3) The choice between any two alternatives cannot be influenced by the presence or nonpresence of a third alternative. (4) No individual can always secure his choice regardless of the preferences of others. A later expositor has provided a mnemonic for these properties:⁵ unrestricted domain, U; Pareto principle, P; independence of irrelevant alternatives, I; nondictatorship, D. Dealing with the simplest case of interest (at least two individuals and at least three alternatives), the famous Arrow result is that there is no social welfare function that satisfies U, P, I, and D.

Let us stop for a moment to get our bearings in the flow chart. We should like all of our social decisions to apply over an unrestricted domain. Condition U is imposed at all nodes in the flow diagram and throughout this paper. Next observe

⁴ For the conditions, see K. Arrow, *Social Choice*, pp. 22-33.

⁵ Amartya K. Sen, *Collective Choice and Social Welfare* (Holden-Day, Inc., San Francisco), pp. 41-42.

that the "Arrow result" box lies on the ordinal branch. The independence of irrelevant alternatives condition, I, requires that the centralized decision procedure rely on no more than individuals' ordinal preferences. The impossibility of simultaneously satisfying all four Arrow conditions is indicated by the paths of the arrows emanating from the box. They are stopped either by inefficiency (nonsatisfaction of P) or dictatorship (nonsatisfaction of D).

Centralized Decision, Cardinal Preferences (B)

Somewhat different formulations of the centralized social choice problem will lead to success stories. A number of analysts, some of whom substantially predate Arrow, have proposed that acceptable centralized decision procedures can relax one or another of the conditions he imposed. Perhaps the most frequently cited suggestion is that the independence of irrelevant alternatives condition, I, be softened or eliminated. The objective underlying this relaxation is to secure some cardinal measurement on individuals' intensities of preferences.

By way of example, more than two centuries ago, Borda proposed the rank-order method of election, a method now frequently employed to establish national rankings of college athletic teams. Under this system, preassigned weights are given to voters' first, second, third choices, etc. Sum each candidate's scores over all voters: highest aggregate score wins. The procedure is neither dictatorial nor inefficient.⁶ Reference to the flow diagram shows that its emanating arrow penetrates to the rightmost rectangle.

Are rank-order systems ethically appealing? Neither economic theory nor any other axiomatic system can give us any insight into this question. Each analyst of social choice must decide for himself whether in making the choice between A and B, it is of concern how each fares with the voters not only with respect to the other, but also with respect to C.

We need dwell no further on the appropriate constraints for centralized procedures; decentralized procedures represent the principal focus of

this paper. Thus far we have been merely setting the stage and filling in the complementary boxes.

Decentralized Decision Procedures

The remainder of this paper will follow out the implications of and possible standards of performance for a variety of decentralized decision procedures. It will index them, as it did the centralized procedures, by the capital letters in the flow diagram.

The analysis that follows is largely nonmathematical and thus almost by necessity, unrigorous. Other theorists, no doubt, will be able to reconstitute these results in more formal, perhaps stronger contexts. The purpose of this paper is to sketch some new methods and results, and the framework in which they apply.

With centralized decision, each voter's preferences are assumed to be known by the social choice mechanism. With decentralized decision, knowledge of preferences is gained only indirectly. Under decentralized procedures each voter fills out a ballot; he is assumed to follow as best he can his own self-interest. These ballots are processed by some mechanism to produce a social choice. Depending upon the particular choice mechanism that is in operation, and the situation in question, a voter's ballot may or may not be a complete and truthful indicator of his preferences. This observation provides a hint about where we are going. A whole new class of problems arises when we move from centralized to decentralized decision procedures. Essentially they revolve around getting individuals to reveal their preferences. The unfortunate result, as we shall see later, is that the very structure of social choice schemes that elicit true preferences on ballots leads to inefficiencies in outcomes.

An abstract representation of a decentralized choice procedure will facilitate discussion. There are

m voting individuals indexed over i , and
 n alternatives indexed over j .

An individual, i , fills out x_i as the ballot indicating his preferences. The voting system processes the received ballots, $X = (x_1, \dots, x_i, \dots, x_m)$ to arrive at a social choice. A social choice is represented by the probability vector $P(X) = (p_1(X), \dots, p_j(X), \dots, p_n(X))$ whose elements indicate the probability that an alternative is selected. In the language of mathematics, a voting mechanism maps X into P .

Most of the familiar voting procedures are deterministic. Given X , a single alternative is selected with certainty; one element of P is unity, the rest zero.

Later sections of this paper discuss voting pro-

⁶ Following Pareto optimality, efficiency requires that a switch away from the selected candidate would lower the welfare of at least one voting individual. If the selected candidate had the highest total score, then there could be no other candidate who received an equally high individual score from each voter. A switch from the man with the highest total would therefore involve a loss for at least one voter.

⁷ Special difficulties arise if lotteries on alternatives are permitted; and rank-order schemes need not lead to Pareto-optimal outcomes. See Richard Zeckhauser, "Majority Rule with Lotteries on Alternatives," *The Quarterly Journal of Economics*, 83 (November, 1969), 696-703.

cedures that may lead to randomized outcomes. These outcomes are analyzed and evaluated before the final results are known, before the lottery is conducted. Randomized outcomes may lead to gains in efficiency. More important for the purposes of this paper, they may help insure that individuals mark their ballots with their true preferences.

To evaluate probabilistic outcomes, a voter must be able to evaluate outcomes in a non-deterministic world. Even if the world is deterministic, there may not be full information, in which case the voter may be making a decision under uncertainty. Fortunately, there is a well-developed body of literature on prescriptive decision making under uncertainty. We shall follow the major track of that literature.⁷

A rational decision maker under uncertainty is assumed to assign a utility value to each possible outcome. The paradigm decision problem requires that he select one among alternative lotteries where each lottery is described by the probability vector it offers for the different outcomes. In choosing among lotteries, the rational decision maker selects the one that offers him the highest expected utility value.

Notice that judgments of welfare are made here on an ex ante basis, before lotteries are resolved. Thus certain social choices will be ruled non-Pareto optimal, even though they will eventually lead to situations that considered in isolation are Pareto optimal. An example displays the properties of this before-the-fact evaluation procedure. Two risk-averse individuals each have \$10,000 in the bank. They are given the opportunity to gamble their total savings on the flip of a coin. Both would decline as they both prefer their present situation to participation in the lottery. If they were forced to participate in the lottery, it would be a non-Pareto-optimal situation. This despite the fact that if the lottery were conducted and one man ended up with \$20,000 and the other with nothing the outcome would be Pareto-optimal.⁸

⁷ For a good introduction to this subject, see Howard Raiffa, *Decision Analysis* (Reading, Mass.: Addison-Wesley, 1968).

⁸ The ex-ante expected utility approach can be employed to make evaluations of social welfare. See Richard Zeckhauser, "Determining the Qualities of a Public Good—A Paradigm on Town Park Location," *Western Economic Journal*, 11 (March, 1973), 39–60. For an application of this principle in the social decision context, see Richard Zeckhauser, "Majority Rule With Lotteries on Alternatives." Peter Fishburn formalizes this argument in "Lotteries and Social Choices," *Journal of Economic Theory*, 5 (October, 1972), 189–207. Peter C. Ordeshook employs the principle to define candidates' mixed strategies as lotteries on social states should they get elected. See "Pareto Optimality in Electoral Competition," *The American Political Science Review*, 65 (December, 1971), 1141–1145.

To conduct an analysis of situations of this sort requires that individuals define what are called von Neumann-Morgenstern utilities for each possible outcome.⁹ The utility values for individual i are indicated by the v_i^j 's; they are normalized with a value of 1 assigned to the most preferred outcome, and 0 to the least.

The voting mechanism, however, may seek to elicit something much less than the individual's full cardinal preference structure. Majority rule procedures, for example, merely ask the individual which is his most preferred alternative.

It is useful to classify decentralized decision procedures on a couple of dimensions. Decentralized procedures, like those that are centralized, can rely on cardinal or merely ordinal indications of individual's preferences. The two alternatives are indicated in the first branching in the flow diagram.

Unique Voting Schemes

The second branching reflects a consideration that does not arise with centralized procedures; for with them, individuals' preferences are assumed to be known. With decentralized procedures, however, each individual ballots in his own self-interest. This raises the possibility that with some of these procedures and some situations an individual working in his own behalf will find it desirable to disguise his preferences. This may be unfortunate. It may be important for the apparatus that is processing the votes to be able to determine the exact preferences of an individual from his markings on the ballot.

If an individual will mark his ballot the same way for two or more preference structures, then the ballot is not unique.

Definition: A voting system is called *unique* if a voting individual will mark his ballot in a different manner for every possible configuration of his preferences.

Decentralized Decision, Ordinal Preferences, Unique (C)

If merely ordinal preferences are required, it would seem the task of constructing a unique scheme would be somewhat simpler. In many real world situations things are simpler still. Individuals are asked to indicate only a small portion of their ordinal preference structure, their first-place choice. This is the customary procedure in the United States when we are selecting a single individual for an office: the presidency, a mayorship, the local dog catcher.

⁹ Appropriate historical attribution would give much of the credit for this utility concept to Frank P. Ramsey.

A traditional majority-rule decision procedure will lead to honest revelation of preferences if there are but two alternatives. But when the competitors number three or more such honesty can no longer be assured. For example, if in a three-man race your preferred candidate *A* is likely to receive little support, you may choose to vote for your second choice rather than waste your vote on a lost cause. If your ordering is *A-B-C*, you will vote for *B*. You would vote the same way if your ordering were *B-A-C* or *B-C-A*. The voting procedure is not unique, but this should have been expected. There are six possible orderings and only three possible ballot markings. There is no way to have a unique marking for each ordering. What is disturbing is that the system is not unique with respect to the first-place preference, and it is information on that preference that the system was attempting to solicit. Considerations such as these lead us to a modified concept of uniqueness, one that applies in a more restricted context.

Definition: A voting system is called *unique with respect to a property of a preference ordering* if a voting individual will mark his ballot in a different manner for every possible configuration of that property.

For example, a voting system is unique with respect to first-place preferences if a voting individual will mark his ballot differently depending upon which candidate he likes best.¹⁰ Majority rule does not qualify.

Does a voting system exist that is unique with respect to first-place preferences? Yes, there is a type of system that meets this requirement. It is most easily understood with the aid of a mechanical example that has the required intrinsic properties.

The Random Dictator System: A Voting System That is Unique with Respect to First-Place Preferences

Each individual writes the name of a candidate on a ballot. The voters' ballots are collected and placed in a revolving drum. After shuffling, a ballot is chosen at random. The name on the chosen ballot is the elected candidate. In effect, the voter whose ballot is chosen dictates the outcome, hence the name of the system. (Matters would be just the same if a voter were first selected at random, and then the selected voter were asked to choose the elected candidate.)

The random dictator system is not determinis-

tic. If an alternative *j* is marked as first choice on *k* ballots, p_j will equal k/m . That is, a candidate will have a probability of election that is proportional to the number of first place votes he receives. The p_j 's will take on fractional values (except in the special case where there is a unanimous first choice); the system will not be deterministic.

We shall see here, and again later with cardinal preferences, that the consideration of probabilistic outcomes is essential if a voting scheme is to be unique. Consider the voter's behavior in the random dictator model. He assigns utility values v_A , v_B , and v_C to the three candidates. Why should he vote for his favorite, *A*? Assume that instead he had voted for *B*. This would reduce the probability that *A* gets elected by $1/m$; it would increase the probability that *B* got elected by $1/m$. The net change in the expected utility to the voter would be $(1/m)(v_B - v_A)$. By assumption, $v_B < v_A$; the voter would lose by switching; he also would lose if he decided to choose *C*. The key element here is that when the individual switches his vote the probability gain for the switched-up candidate is just equal to the probability loss for the switched-down candidate. This implies that the probability of election of the third candidate remains constant when a vote is switched between the other two. This absence of third-candidate effect is essential. Otherwise, the decision on whether to vote for *A* or *B* might depend on how the vote affects the probability that *C* gets elected.¹¹ A formal generalization of this argument requires a new concept.

Definition: A voting system will be said to be *probabilistically linear* if it is of the following form. Let *S* be the matrix of votes, where element $s_{ij} = 1$ if voter *i* submitted his ballot for *j*, and 0 otherwise. The vector *P* that gives the probability that each candidate is elected is calculated $P = wS + e$. Here *e* is a row vector giving exogenous contributions to the election probabilities, and *w* is a row vector of non-negative weights summing to $1 - \sum_j e_j$.

Theorem I: If a decision procedure that solicits individuals' first place preferences is to be unique, it must be probabilistically linear.

Note that probabilistic linearity is equivalent to the following property: For any voter *i* and for any pair of candidates *D* and *E*, switching his vote from *D* to *E* must increase the probability that candidate *E* gets elected by the amount w_i , de-

¹⁰ If we extend this concept to the market setting, we discover that market procedures are unique with respect to the information required for efficiency: individuals' marginal rates of substitution and producers' marginal rates of transformation among valued goods.

¹¹ Say v_A is only slightly greater than v_B , but much greater than v_C . If *C* had less probability of being elected if the individual voted for *B* rather than *A*, it might be reasonable for him to vote contrary to his true preferences.

crease the probability that D gets elected by the amount w_i , and leave all other election probabilities unchanged.

The proof of the theorem can be demonstrated with a three-man example. For notation, let $\Delta_{D \text{ to } E}^F$ represent the change in the probability that F is elected if voter i switches his vote from D to E . Consider the previous example where the present vote is for A . Necessary conditions for probabilistic linearity are that

$$\Delta_{A \text{ to } B}^A = -\Delta_{A \text{ to } B}^B = \Delta_{A \text{ to } C}^A = -\Delta_{A \text{ to } C}^C$$

and that

$$\Delta_{A \text{ to } B}^C = \Delta_{A \text{ to } C}^B = 0.$$

Given that the sum of the mutually exclusive probabilities of election must add to 1 as they did when the vote went to A , there are the conservation equations

$$\Delta_{A \text{ to } B}^A + \Delta_{A \text{ to } B}^B + \Delta_{A \text{ to } B}^C = 0$$

and

$$\Delta_{A \text{ to } C}^A + \Delta_{A \text{ to } C}^B + \Delta_{A \text{ to } C}^C = 0.$$

To see that $\Delta_{A \text{ to } B}^C$ must equal 0, assume it were negative. The voting system must handle any set of preferences. Thus, let the voter strongly dislike C , say $v_A - v_C = k$, where k is a large number, and let him slightly prefer A to B , $v_A - v_B = \epsilon$. Despite this preference, the voter will switch his ballot to B , as his net utility gain will be $-\Delta_{A \text{ to } B}^C(k - \epsilon)$, a positive number. Keep the same ordinal preferences, but let the gap between v_A and v_B be k , with the gap between B and C being the minimal ϵ . Then the individual will choose A over B , the utility gain once again being $-\Delta_{A \text{ to } B}^C(k - \epsilon)$. Thus, unless $\Delta_{A \text{ to } B}^C = 0$, the voter may ballot in two different ways, despite the fact that his ordinal preferences are the same in both instances. This contradicts the assumption that the voting system is unique. Therefore $\Delta_{A \text{ to } B}^C = 0$ as claimed.

An identical argument shows that $\Delta_{A \text{ to } C}^B = 0$. These results together with the conservation equations show that $\Delta_{A \text{ to } B}^A = -\Delta_{A \text{ to } B}^B$ and $\Delta_{A \text{ to } C}^A = -\Delta_{A \text{ to } C}^C$. To show that $\Delta_{A \text{ to } B}^A$ must equal $\Delta_{A \text{ to } C}^A$, merely apply the argument above to show that whether you ballot for B or C cannot influence the probability of election for A if a voting system is to be unique with respect to ordinal preferences. The conditions of the theorem are thus demonstrated.

This theorem and the random dictator system can be extended to deal with further places in voters' ordinal rankings. Provide each voter q ballots for his first choice, r for his second, s for his

third, etc., with $q > r > s$. The selection procedure is random as before.

Thus we find that only variants of the random dictator system will elicit ballots unique with respect to individuals' (portions of individuals') ordinal preferences. How well does the random dictator system perform? An example tells the sad news.

With the values shown in the box, Voter 1 will mark his ballot with A and Voter 2 will inscribe a C .

Utility Valuations in Two Voter World

	v_A	v_B	v_C
Voter 1	1	.90	0
Voter 2	0	.90	1

The resulting social choice when the random dictator system is employed will have the probability vector $P = (.5, 0, .5)$. The expected utility values for each of the voters will be .50. But this outcome is not Pareto optimal. Both voters would have preferred the social choice $P = (0, 1, 0)$.

The difficulty is apparent. The random dictator system does not take into account intensities of preference. (Indeed, no information is gathered on second and further preferences, but even if it were, this would not cover the intensities problem. With the same ordinal patterns, both voters could have assigned a value of .10 to v_B . In that case the social choice of the random dictator device would be Pareto-optimal, as would be any lottery on A and C .)¹²

To sum up, it is interesting to observe that there exists a class of unique ordinal voting schemes.¹³

¹² For further discussion of this matter, see R. Zeckhauser, "Majority Rule with Lotteries on Alternatives."

¹³ This paper is addressed to situations where a single outcome is selected, and all individuals vote to help determine that outcome. The model does not apply, for example, to the selection of a legislature. (With a stretch of the imagination, we might construe voters to be choosing among all possible legislatures, but usually an individual voter ballots to help determine only a small part of that body.) Strict proportional representation is the closest (but still imperfect) legislative equivalent to the random dictator system. The number of seats secured is proportional to the number of votes received.

Proportional representation will guarantee honest balloting if two conditions are satisfied. (1) Each voter's utility for the legislature must be an additive separable function of his utilities for each elected representative. (Otherwise, his preferred vote might depend on the candidates others were voting for.) (2) All ballots cast in the first round must count in the determination of the final legislature. This requires that representation be broken down into arbitrarily small units, and that there be no elimination of candidates. (Condition (2) can be violated if there are strict party interests, and if each voter is indifferent among the candidates of his party.) See Mark Thompson and Richard Zeckhauser, "Proportional Representation," mimeo (1971). A referee suggests that Kramer also has unpublished work on this subject.

We now know that such schemes perform terribly inefficiently. Leave aside the adverb, and this lesson could have been derived directly from the Arrow results.

Decentralized Decision, Ordinal Preferences, Nonunique (D)

This next class of social choice procedures merits discussion primarily because it is the one most frequently in use in the United States. Majority and plurality rule both fall under this category. The Arrow results tell us that these schemes cannot meet his four standards either.

One difficulty with these procedures, as is well known, is that they lead to intransitive choice patterns for certain combinations of individuals' preference orderings. Transitivity is required if we are to have a social ordering. The only way around the problem is to rule out patterns of individuals' preferences that do not satisfy the single-peakedness condition.¹⁴ To exclude in this way would be to violate Arrow's condition *U*.

Now that we are working on a decentralized basis, further problems may arise. The vote processing mechanism may not even be able to divine individuals' true preference orderings. It turns out, fortuitously, that single-peakedness is also sufficient to eliminate any incentive for a voter to disguise his preferences. Getting rid of one problem automatically eliminates the other. Whenever the structure of voters' preferences is such that majority rule can be guaranteed to work on a centralized basis, it can be guaranteed to work in a decentralized format as well.

Standards for Decentralized Schemes

One lesson we have learned thus far is that ordinal preferences do not provide sufficient information to enable social choices to meet Arrow's standards. For centralized procedures, we saw that information on cardinal preferences is sufficient to guarantee an efficient, nondictatorial outcome. The key question for the remainder of this paper is whether we can find decentralized procedures that perform satisfactorily when the balloting system elicits cardinal indications of the voters' preferences.

Satisfactoriness, like beauty, is in the eyes of the beholder. My criteria, consistent with the earlier analysis, are Pareto optimality and nondictatorship. The first concept is unambiguous; the latter is subject to a variety of interpretations. I shall provide one definition of dictatorial outcomes

that enables me to achieve my other results. The reader may come up with other definitions that serve equally well.

Dictatorial Outcomes—What They Are and Why They Should Bother Us

Most discussions of social choice are concerned with the selection of a candidate in a single election, or an outcome in a particular set of circumstances. Given the restricted domain of such a social decision, it might be perfectly acceptable to reach an outcome that catered heavily to one individual's or group's preferences and little or not at all to those of others. (Surely, this provides the normative justification for such practices as log-rolling.)

Other social decisions can be of much greater consequence. Indeed at the most general level, we can conceive of a grand social decision as selecting a single point from the entire space of social states. It is with reference to momentous social decisions of this sort that we impose distributional requirements on the outcomes of social choice processes. We should like to observe outcomes that demonstrate that the preferences of more than one individual have been taken into account.

Even if a series of social choices is made sequentially or in a variety of separate arenas, we might conceive of the combination of the voters' expressed preferences on all issues and the social choice mechanism as selecting one point in the space of social states. Thus even if a great number of social choices is to be made on a one by one basis, we should like to see the total social outcome reflect the fact that all individuals have participated in the selection process.

One indication that a group had been excluded from positive consideration in the social choice procedure would be that it selected an outcome that was most unattractive for that group. A more precise understanding of what is meant by unattractive is given by the term Pareto-terrible.

Definition: An outcome is called *Pareto-terrible* for a group of individuals if it is a strictly constrained minimum: if there exists an outcome that is preferred by all members of the group, and if there is no outcome that is worse for some member without being better for some other member.

An outcome is Pareto-terrible for a one-man group, an individual, if it is his least preferred outcome. With lotteries permitted there will always be outcomes that are not Pareto-terrible for any reference group.

I shall employ the Pareto-terrible concept as a cornerstone of my definition of dictatorial outcomes.

¹⁴ See A. Sen, *Collective Choice*, pp. 166–168 for a discussion of single-peakedness where individuals' preferences are defined over a single dimension. There is no equivalent to the single-peakedness criterion if two or more dimensions enter individuals' preferences; cyclical majorities will be the rule.

Definition: A voting scheme is *dictatorial* for a set of voting individuals preferences if it selects an outcome that is Pareto-optimal for one nonempty subset of individuals and is Pareto-terrible for the complementary nonempty subset of individuals.¹⁵

With this definition in tow, we can proceed on our search. Exposition is simplest if we step slightly out of order to the bottom of the Context and Summary Diagram and address first the question of honest balloting.

Decentralized Decision, Cardinal, Nonunique (F)

Nondictatorial, Pareto-optimal social choices cannot be made unless, in general, the voting scheme is unique with respect to individuals' cardinal preferences. In particular instances non-uniqueness may not matter. For every nonunique ballot marking for individual 1, however, there will be a set of preferences for individual 2 such that Pareto optimality cannot be assured.

A three-candidate example will reveal the difficulties. Assume that individual 1 marks his ballot x' whether his preferences are (1, .60, 0) or (1, .70, 0) for candidates A , B , and C respectively. Individual 2 has preferences (0, .35, 1). If individual 1's FIRST set of preferences hold, candidate B will have zero probability for all Pareto-optimal choices. With individual 1's SECOND preferences, all Pareto-optimal probability vectors have either A or C receiving zero probability.

tween two situations which require different outcomes to be Pareto-optimal.

The 1, 0, 0 and 0, 0, 1 vectors are ruled out because they are dictatorial. They allow one voter to get his first choice at the expense of the other who receives the outcome that for him is worst. This would be particularly objectionable if, as is quite possible, the voting scheme were selecting a single point from the space of social states, i.e., if all social decisions were being simultaneously resolved.¹⁶

To achieve Pareto optimality, any voting scheme that is nondictatorial for this set of preferences must be able to distinguish between FIRST and SECOND configurations of individual 1's preferences. An equivalent "counterexample" demonstration can be arranged for any indistinguishable pair of individual 1's preferences. The three-alternative case covers all essential complexities.

First consider the case where individual 1's indistinguishable configurations have different alternatives as the most preferred. Let individual 2 be indifferent between the two sometimes-most-preferred-by-1 alternatives, with the third alternative less attractive. Which of two alternatives is Pareto-optimal depends on which of individual 1's preference configurations applies; there is no way to tell.

Matters are a bit more complicated if individual 1's indistinguishable orderings rearrange his second and third candidates or merely change their

Pareto Optimality of Different Probability Vectors

Configuration of Individual 1's Preferences	Probability Vectors ($A+$ indicates positive probability)						
	1, 0, 0	0, 1, 0	0, 0, 1	+, +, +	+, +, 0	+, 0, +	0, +, +
FIRST	yes	no	yes	no	no	yes	no
SECOND	yes	yes	yes	no	yes	no	yes

Except for the first and third listed vectors, no probability vectors are Pareto-optimal for both of individual 1's possible preference configurations. The problem is simple. The mechanism that processes the votes is unable to distinguish be-

relative scores. To construct the counterexample first normalize the two individuals' utilities to 1 and 0. Add together 1's and 2's utilities for each of the three candidates. The candidate with the lowest total must receive zero probability in any nondictatorial Pareto-optimal outcome. (If the

¹⁵ The concluding theorem of the paper employs the dictatorship concept negatively. It states that no system can simultaneously be nondictatorial and at the same time guarantee that other desirable standards are met. The more restricted the definition of dictatorship, then, the stronger my final result. This result would still be achievable if the term "Pareto-optimal" in the above definition were replaced with "unanimously most preferred." The argument for the definition in the text is that it captures more of what we may mean by dictatorship in a general context.

It should be noted that Pareto-terrible is not a perfect counterpart to Pareto-optimal. There are situations where all outcomes are Pareto-optimal and none Pareto-terrible. The converse is not true.

¹⁶ On a less grandiose level, there are a number of ways that single social-choice decisions can be formulated to deal with a large number of issues. Issues can be compounded. The issues at hand might be whether Smith or Jones should be mayor and whether or not the new high school should be built. This can be viewed as a single decision with four possible outcomes. Alternatively, we might amalgamate issues by employing a lottery. A coin will be flipped to see whether a voting mechanism will select a mayor or decide on a high school. Here too there are four possible outcomes, each composed of two contingent decisions.

two voters have opposite orderings, then the extreme candidates may tie for lowest total. Then, at least one of these candidates will be excluded from any Pareto-optimal outcome.) Given the two different utility vectors for 1, select a utility vector for 2 so that (a) his first place choice is not the same as that of 1, and (b) the candidate receiving the lowest total will differ depending on which of 1's vectors applies. Such a selection will always be possible.¹⁷

It is true, of course, that for certain patterns of preference for 2, particular instances of non-uniqueness for 1 will not matter. This raises the question whether a voting individual can monitor other individuals' preferences or ballot markings to help select his own ballot marking. Such monitoring raises no problems so long as each individual's markings are unique, conditional on the ballot markings of others. For with this information, all individuals' accurate cardinal preferences can be deduced.

A definitional problem arises with the concept of uniqueness if voters monitor each others' ballots and only employ the same marking for two different preference orderings if they discover that it will not affect the set of Pareto-optimal outcomes. Notice that this monitoring would have to be most accurate, for as long as there is any positive probability that the other individual(s) have a "counterexample" set of preferences, Pareto optimality cannot be assured. In discussing uniqueness for the remainder of this paper, I shall assume either (a) that the required accurate monitoring is not possible, or (b) if it is possible, an individual who has an incentive to mark his ballot nonuniquely will sometimes do so in cases where other individuals have counterexample-relevant sets of preferences.¹⁸

This slightly tortuous argument leads to a general result that can serve as a building block for later arguments.

Theorem II: For nondictatorial voting schemes, if the ballot processing mechanism is always to lead to Pareto-optimal outcomes, the voting individuals' ballots must be unique with respect to their cardinal preferences.

¹⁷ Another numerical example may be helpful. Assume that 1 marks his ballot the same way whether his cardinal utility values are 1, 5, 0 or 1, 0, 2. Then if individual 2 has preferences 0, 1, 9, for example, a nondictatorial Pareto-optimal outcome cannot be assured. The third candidate can never be included for individual 1's first set of preferences and must always be included for his second set of preferences.

¹⁸ I strongly believe that it is possible to substantiate the arguments in the remainder of this paper without these assumptions. But the whole area is most elusive, and I have not been able to discover a convincing proof for this assertion.

Decentralized Decision, Cardinal, Unique (E)

To continue the thrust of our major investigation, we should like to know the properties of voting schemes that are unique with respect to cardinal preferences. In essence, we are asking: What voting schemes will get individuals to mark their true cardinal preferences? Unique schemes require one-to-one correspondences between ballot markings and preferences. If the mapping process is understood, we can say that in effect individuals are marking their true preferences.¹⁹

The required structural characteristics can be easily delineated in our three-candidate example. Before marking his ballot, the individual voter will consider his possible effects on the probability outcome vector. Matters are simplest if we start with the case of one individual.

What are the structural characteristics of a decision process that gets a single individual to reveal his true cardinal preferences? The individual is assumed to understand how the scheme works. The scheme is an announced function, s , that transforms the individual's ballot into a probability vector outcome. This process can be represented as

$$P = s(x).$$

The individual, knowing the form of s , will select x to maximize his expected utility. Representing his utility vector as V , and his optimal ballot as x^* , this can be expressed

$$\max_x s(x)V^T \text{ is achieved at } x^*.$$

We wish to discover the properties of the function s that will lead

$$x^* \equiv V.$$

That is, we wish to construct a function s such that it is in the individual's best interest to vote his true cardinal preference.

First, the function must obviously assign probabilities in the same rank order as the utilities that are provided through the x vector. (For simplicity,

¹⁹ It may be possible to construct voting schemes that are not unique for each individual taken alone, but are unique for all individuals taken together. This would require that individuals have some capability to monitor each others' preferences and ballot markings. For example, individual 1 might mark his ballot the same way when he has preferences V_1' and individual 2 marks X_2' as he does when he has preferences V_1'' and individual 2 marks X_2'' . The processing system can take 2's markings into account in deciphering individual 1's preferences.

If each individual's cardinal preferences are to be revealed, it is sufficient that *given other individuals' markings* there be a one-to-one correspondence between an individual's markings and his preferences.

we consider the case without ties.) Otherwise, the individual would have an incentive to misreport which alternative he liked best and which least.

With no loss of generality, we can normalize and assign a utility value of 1 to the most preferred alternative and 0 to the least. Assign the value y to the intermediate alternative; thus $V=(1, y, 0)$.

The key question then is, what additional properties must $s(x)$ have so that

$$\max_z s(1, z, 0) \begin{pmatrix} 1 \\ y \\ 0 \end{pmatrix} \text{ is achieved at } z = y$$

for all y , $0 < y < 1$.

The sum of the probabilities of the outcomes must equal 1. Thus, the function $s(x)$ is fully described by detailing the effect of the choice of z on p_1 and p_2 . Represent these relationships

$$p_1 = f(z), \text{ and} \\ p_2 = g(z).$$

The individual's expected utility is

$$1p_1 + yp_2 + 0(1 - p_1 - p_2).$$

He will select z to maximize

$$f(z) + yg(z);$$

the third term vanishes because of the zero multiplicand.

I will deal with the situation in which the f and g functions are continuous and differentiable; my results can easily be extended to noncontinuous cases. First-order maximization procedures applied to the preceding expression reveal that

$$f'(z) = -yg'(z).$$

If it is to be in the individual's self-interest to select $z=y$, a significant property of f and g is dictated.²⁰ For all z

$$f'/g' = -z. \quad [A]$$

Additional required properties are that for all z ,

$$f''(z) + zg''(z) < 0,$$

$$g(z) < f(z),$$

and

$$g(z) > 1 - f(z) - g(z). \quad [B]$$

²⁰ The uniqueness requirement is equally well satisfied so long as there is a one-to-one mapping between z and y . Any scheme that induces such a mapping has the key structural aspects that are discussed below in relation to this scheme.

The first requirement tumbles out of the second-order conditions that guarantee that the individual is at a maximum, not a minimum. The second and third requirements insure that the probability assigned to the highest value outcome is greatest, the second is second, and the lowest is lowest.

We should also like to have

$$f(1) = g(1),$$

$$g(0) = 1 - f(0) - g(0).$$

If alternatives are ranked the same, they should receive the same probability assessment.²¹

There is an infinite number of schemes that meet these requirements. One satisfactory scheme has the functions

$$p_1 = f(z) = .6 - .1z^2/2,$$

$$p_2 = g(z) = .25 + .1z,$$

and

$$p_3 = 1 - p_1 - p_2 = .15 + .1(z^2/2 - z).$$

Here $g'(z) = .1$; and to satisfy requirements

$$f'(z) = -zg'(z) = -.1z$$

for $z=y$. For all values of z , there must be the ordering $p_1 > p_2 > p_3$. This three-alternative scheme is illustrated in the figure below.

Figure 1. A scheme that leads an individual to express his true cardinal preferences.

	Value of z					
	0	.2	.4	.6	.8	1
p_1	.6	.598	.592	.582	.568	.55
p_2	.25	.27	.29	.31	.33	.35
p_3	.15	.132	.118	.107	.102	.10

²¹ I am indebted to Kenneth Arrow for this point among others.

The procedure just employed to construct a unique voting scheme for cardinal preferences can be readily extended to the many-alternative case. The computations get somewhat messy as the number of alternatives increases, but no new conceptual problems arise.²²

Pareto Optimality of the Unique with Respect to Cardinal Preferences Scheme

The scheme presented is unique with respect to the individual's cardinal preferences. Unfortunately, it is not Pareto-optimal. Pareto optimality would require that $p_1 = 1$. This misfortune, alas, is representative. With rare exceptions, schemes that are unique with respect to information required to make an efficient decision are by their very construction not Pareto-optimal.

The general difficulties that are encountered can be understood in the context of the simplest case where the difficulties matter, the case of two voters and three alternatives. (The one-voter case is not disturbing; Theorem II applies only to nondictatorial voting procedures. With one individual, dictatorship is acceptable; the cardinal preferences required by Theorem II are not needed to achieve a desirable outcome. Merely ask the individual which alternative he prefers and give it to him.)

Voting Schemes with Two Voters and Three Alternatives

With two or more individuals, as Theorem II tells us, efficient voting procedures that are democratic require cardinal preferences as inputs. The procedure must be unique with respect to individuals' cardinal preferences.

The insights we have derived from consideration of the one individual situation are readily extended. Look at the matter from the standpoint of voter 1. Assume that the vector giving voter 2's true cardinal preferences, γ , has been fed to the decision mechanism, and that voter 1 knows this γ .

The social outcome now is a function of both γ and x . Represent this relationship as

$$P = r(x, \gamma).$$

If honesty is to be insured, whenever

x^* is maximizer of $r(x, \gamma) V^T$, then

$$x^* \equiv V.$$

Paralleling our procedure from before, with z being the utility value of the in-between alternative, represent the function r fully by

²² To deal with discontinuous cases, merely replace $(f[x + \Delta x] - f[x])/\Delta x$ wherever $f'(x)$ appears, and similarly for $g'(x)$. Second derivatives can be handled in parallel fashion.

$$p_1 = j(z, \gamma),$$

and

$$p_2 = k(z, \gamma).$$

The efficiency condition that parallels [A] is for all z ,

$$j_1(z, \gamma) = -zk_1(z, \gamma).^{23} \quad [C]$$

There are no simply-stated conditions that insure the individual will write down his preferences in their true order. What is needed boils down to the tautological requirement that for all γ , the x that is the maximizer of

$$p_1 + \lambda p_2, \quad 0 \leq \lambda \leq 1$$

is of the form $(1, z, 0)$, where z too is a value between 0 and 1.²⁴

Consider a scheme that meets all requirements and is unique with respect to the individual's cardinal preferences. For such a scheme an individual with preferences $(1, y, 0)$ will select $z = y$ for all possible values of y . From condition [C], given that z is less than 1, the increase in p_2 as z increases is greater than the corresponding decrease in p_1 . The slack can only be taken up in p_3 , ($p_1 + p_2 + p_3 = 1$), which therefore must be decreasing over the whole range of z . This implies that p_3 must have positive probability (except in the case when the individual is indifferent between his first and second alternatives).²⁵ This observation suggests another general result.

Theorem III: A voting scheme that is unique with respect to individuals' cardinal preferences must lead to probability vector outcomes all of whose elements are positive.

²³ This analysis could be carried out equally well for a world where other individuals' ballot markings were uncertain parameters. A subjective probability distribution $f(\gamma)$ would be placed over that parameter. Thus, efficiency condition [C] would become

$$\int j_1(z, \gamma) f(\gamma) d\gamma = -z \int k_1(z, \gamma) f(\gamma) d\gamma.$$

Other conditions would be modified equivalently; the basic results would be the same. Where there is perfect information on other individuals' preferences and ballot markings, the case considered in the text,

$$f(\gamma) = 1 \quad \text{for } \gamma = \gamma^*, \quad \text{otherwise } 0.$$

²⁴ One scheme that elicits true preferences for this two-individual case allows either individual to allocate 50 per cent of the outcome probability. Each individual takes half his probability as given and deals with the rest as he would in Figure 1, with the vertical scale relabeled with .5 placed where there is now a 1.

²⁵ If $y = z = 1$, then p_3 can be 0. As z can no longer increase, p_3 need not further decrease in value.

Shortcomings of Schemes That Are Unique with Respect to Cardinal Preferences

Theorem III has a very unfortunate implication. No democratic voting schemes that are unique with respect to individuals' cardinal preferences will guarantee Pareto-optimal outcomes. (We saw this previously when there was but one individual.) With two individuals and three alternatives, say, all three alternatives will have positive entries in the probability outcome vector. The diagram below illustrates why, in general, such a probability vector cannot represent a Pareto-optimal outcome. In the diagram, each alternative is represented by its vector of individuals' utilities.

Figure 2. Pareto optimality and vectors of individuals' utilities for alternatives.

The northeast frontier represents all Pareto-optimal points. These points can be achieved through linear weighting of alternatives *A* and *B* or a linear weighting of alternatives *B* and *C*. If all three alternatives are given positive weight, a point strictly interior to the triangle *ABC* will be the outcome. Every such interior point is dominated by a point on the northeast frontier; therefore it cannot be Pareto-optimal. Only in the case where all three alternatives lie on the same straight line will it be possible for a Pareto-optimal scheme to give positive probability to all three alternatives. (In such a case, the concept of efficient choice loses much of its meaning. All possible probability outcome vectors are Pareto-optimal.)

The conclusion, therefore, is that in general when there are but two individuals, only two alternatives will be involved in Pareto-optimal outcomes. Converting the geometry to n dimensions, we find that with n individuals a maximum of n alternatives will need to be given positive probability weight in order to achieve all Pareto-optimal outcomes. Furthermore, assigning positive probability to more than n alternatives will lead to non-Pareto-optimal outcomes unless the

utility vectors of the excess alternatives are linearly dependent (lie on the same straight line in the two-individual case) on those in some set of n .

Theorem IV: In an n -individual world, assigning positive probability to more than n alternatives whose vectors of individuals' utilities are linearly independent will result in a non-Pareto-optimal outcome.

Major Theorem

The motivation at the start of this paper was to discover a voting system that leads to Pareto-optimal outcomes. Individuals were assumed to vote in their own self-interests. It was recognized that depending on the situation and the voting system, they might or might not vote honestly. The vote-processing system would then lead to an outcome. For at least some situations we should like to require that the outcome be democratic. It was hoped that the outcome would be Pareto-optimal as well. The objective was to find systems that could guarantee these properties. Unfortunately, no such system exists.

Theorem V: No voting system that relies on individuals' self-interested balloting can guarantee a nondictatorial outcome that is Pareto-optimal.

Proof

Consider the case of two individuals with strict preferences among three alternatives whose vectors of individuals' utilities are linearly independent. By Theorem II, "if the ballot processing mechanism is to lead to Pareto-optimal outcomes, the voting individuals' ballots must be unique with respect to their cardinal preferences." By Theorem III, this voting scheme "must lead to probability vector outcomes all of whose elements are positive." But by Theorem IV, assigning positive probability to all three alternatives in this two-individual world will lead to a non-Pareto-optimal outcome. The three theorems together prove that no satisfactory voting system can be found for this case. An equivalent demonstration can be provided for any number of voters.

Summary

The recent literature of social choice has provided rather pessimistic conclusions about the possibility of passing from individuals' ordinal preferences to socially desirable outcomes. Most voting mechanisms, the most common social choice procedure where political outcomes are involved, elicit no more extensive information than individuals' ordinal preferences, and those preferences may not be honestly revealed.

This paper has confronted these problems.

First, it showed that procedures are available that will elicit individuals' honest ordinal and cardinal preferences. With honest cardinal preferences as possible inputs to a decentralized voting procedure, there was a flicker of hope for finding an efficient social choice mechanism. The flicker was extinguished when it was discovered that any social choice mechanism that elicits honest preferences automatically leads to non-Pareto-optimal outcomes. Theorem V presents the disheartening conclusion.²⁶ No voting system that relies on individuals' self-interested balloting can guarantee a nondictatorial Pareto-optimal outcome.

Conclusion

No decentralized mechanism can guarantee a satisfactory social choice. This result is particularly unsettling to us economists, for we are accustomed to the paradigm of the efficient market mechanism functioning in a world of perfect competition.²⁷

Perhaps we should not ask despairingly, Where do we go from here?, but rather inquire, Have we been employing the appropriate mind-set all along?

We economists, to the extent that we are scientists, have fallen prey to the natural tendency to concentrate our attentions on those phenomena for which our theories have the greatest power. The land of perfect competition has been our homeground, and most times when we have ventured out, it has been to consider areas that differ in but one or two aspects from the place we know best. Our prescriptive theories for situations with externalities and public goods with rare exceptions have been developed as if the "aberrant" case we are considering is the sole deviation from the norm of the competitive model. By following this track we have achieved some useful results. But this success has only been achieved at a cost. We have constricted ourselves to view and evaluate new lands in the same terms that we have been able to apply profitably to familiar territory.

²⁶ New variants of Theorem IV could be developed by altering the strength of different definitions, and interchanging existential and universal modifiers. I suspect that Pareto improvements may be possible: stronger results with the same definitions, or stronger definitions leading to the same results.

²⁷ I am indebted to Thomas Schelling, who suggested that I emphasize this theme in my conclusion and provided me with helpful insights. This theme reiterates the central message of my volume, *Studies in Interdependence*.

The results of this paper contribute to a muffled but growing plea: Let us not rely on market-based standards of behavior and performance when examining those important areas of the world that in no way resemble the model of perfect competition. Rather, we should describe and evaluate those areas employing terms and theories developed to meet their specific needs.

Where might this lead us? It might force us to undertake some study of the role of preference revelation. With the competitive market outcome, it is each man for himself. No one cares about anyone else's preferences, and that is the reason that no one has an incentive to disguise or distort information about his own. In all other situations, we care very much about the structure of everyone else's preferences. Self-interested people become appropriately self-conscious about revealing their preferences, and find that they have an incentive to distort them. For example, the essence of a voting problem is a common or shared decision. I shall try to influence your vote. Not only that, the way I shall vote myself will depend very much on my assessment of the voting patterns of others. I cannot be relied upon to provide the information that any vote-aggregating mechanism will wish to elicit. Decentralized decision procedures cannot be expected to function effectively. Recognizing this, we might ask, Is a fully decentralized decision procedure what we should really seek? (Indeed, to the extent that consumer sovereignty relies on individuals' expressed preferences, we might even question its universal desirability.) In political contexts, this would come down to asking, Is voting the appropriate way to make social decisions?²⁸

This brings us full circle from the quote that opens this paper. That observation suggests invoking a geometric analogy for a concluding theme. Geometers may find that they can derive their most powerful results if they analyze and deal with circles, for circles are representations of perfect closed curves. But the more general category is the class of closed curves. It deserves attention too. Reference to the exceptional perfect case, the full circle in this instance, may be a type of analogy that is regularly overdrawn.

²⁸ Many observers of the political scene would argue that our present social choice procedures are very far from aggregative processes that rely on individuals' preferences. See Edward Banfield, "'Economic' Analysis of 'Political' Phenomena; A Political Scientist's Critique" (mimeo.), 1967, and a forthcoming joint piece by Banfield and Zeckhauser on the same subject.

A New Shape Measure for Evaluating Electoral District Patterns

PETER J. TAYLOR

University of Newcastle upon Tyne, England

The year 1812 is famous for the birth of that favorite political monster, the gerrymander. Many facets of this creature's subsequent behavior have been studied although most scholars have overlooked its most powerful trait—the ability to hypnotize both friend and foe alike. Politicians, political commentators, and political scientists have become fascinated by the shapes of electoral districts. Politicians have proposed and sometimes enacted legislation to ensure contiguity and compactness;¹ political commentators have been using their imaginations to conjure up more political monsters;² and political scientists have recently been trying to measure some elusive shape ideas.³ In this short note I want to shake off the hypnotic influence of the gerrymander to consider briefly how the concept of shape has been approached in other disciplines, notably geography, so that we may return to the electoral districting problem with what seems to be a new shape measure that is particularly suited to this problem.

Shape is in many ways a rather peculiar empirical concept. In its most general form it can only be a classificatory concept.⁴ Thus areal shapes are often compared to the shapes of familiar objects—Italy is like a boot, etc. This nominal level of measurement is equivalent to that of the political commentators referred to above. But if we compare areal shapes to geo-

metric shapes⁵ whose basic properties are known, we can produce shape measures at a ratio level. This is one of the basic approaches of political scientists who compare electoral district properties with an ideal circle.⁶ When we do this we are in fact making our shape concept more specific, and we usually call these measurements measures of *compactness*. However, this is not necessarily the final stage in making the shape concept more specific. We can in fact envisage several types of divergence from compactness.⁷ Thus, while we would all recognize a thin rectangle as being "less compact" than a square or circle, we would also have to make a similar statement concerning a five-pointed star. Clearly we have two further concepts here, namely, *elongation* and *indentation*. Furthermore, we can add two topological divergences from compactness to our list, namely, *separation* (noncontiguity) and *puncturedness* (shapes with holes in them).⁸ The advantages of this abstract consideration of shape are that given these four divergences from compactness, we can (1) look at the shape measures we have and see what divergence(s) they measure, and we can (2) make a judgment about which concept is particularly relevant to a given problem and then concentrate on its particular measurement without incorporating less relevant aspects of the shape.

With regard to the first point, shape measures that relate a shape's area to a specified circle would seem to be most sensitive to elongation,⁹ while measures relating a shape's perimeter to a specified circle's circumference are particularly suited to measuring the degree of indentation.¹⁰ Clearly, neither of these approaches is suitable for measuring separateness or puncturedness, although these concepts can be picked up by more general measures of shape based on aggregate divergences from a center of gravity.¹¹ Since difference indices seem to measure different aspects of the general concept of shape, it becomes imperative to consider exactly what one wants to measure in a given problem. Let us consider what we want to measure in the context of political districting problems.

The introduction of shape criteria in any districting problem has traditionally sprung from both positive and negative motives. On the positive side the purpose of considering shape has not been explicit, but very often the shape of districts has been associated with attempts to produce areas within which contact is relatively easy.¹² This contact in turn may foster a sense of community and identity within the district by both party organizations and voters. Clearly noncontiguity is unacceptable on these grounds, since it means areas of a single district are separated by zones of other districts. Indentation is related to contact less directly. Although "indented" shape districts are topologically unitary, so that contact between locations can be maintained by moving solely within the shape, in practice, when any indentations exist, contact between extreme points will be through

zones of adjacent districts. The effect therefore will be similar to that of noncontiguity, and hence will possibly inhibit ease of voter participation and party organization.

The negative motive of compactness and contiguity conditions in districting has been much more explicit: It is simply an attempt to prevent unfair districting of the gerrymander variety. In building up an electoral district from smaller base areas, such as city blocks or rural counties, the drawing of any single boundary will involve making a decision every time base area boundaries join. If the decisions are largely made on partisan political grounds, the result may well be a series of the peculiarly shaped districts with which we are all familiar.

If the above discussion of the purposes of shape measures as districting criteria is accepted, it leads us to conclude that the measure we need should be sensitive to indentation divergences from compactness, while concentrating on the junctions of the base area boundaries where the basic districting decisions are carried out. The indentation index I_A can be applied in just this way.

I_A is a shape measure based on angles rather than one of the more usual distance-based indices. Any shape can be considered a closed curve made up of a finite number of straight line segments. Adjacent pairs of lines define the interior angles of the shape which may be reflexive (greater than 180°) or nonreflexive (obtuse and acute). Every indentation will be represented by a reflexive interior angle. Thus the total number of reflexive interior angles is an *absolute* measure of indentation. This simple measure, however, will partially reflect the number of straight line segments used to describe the shape. This problem is overcome by relating the number of reflexive angles to the number of nonreflexive angles and total angles. The following expression thus defines a *relative* measure of divergence from compactness due to indentation:

$$I_A = \frac{N - R}{T}$$

where N is the number of nonreflexive interior angles, R is the number of reflexive interior angles and $T = N + R$. For all compact shapes that are convex, $R = 0$, $N = T$, and therefore $I_A = 1$. In contrast a five pointed star has five acute angles at the points, five reflexive angles between stems, resulting in $I_A = 0$. These are the two limiting cases, since N cannot be greater than T and R cannot be greater than N if the curve (shape boundary) is to be closed.

⁹ For instance, the measures proposed by Reock, Schumm and Gibb.

¹⁰ For instance, the measures proposed by Schwartzberg and Miller.

¹¹ For the use of such measures in political districting problems compare: Henry F. Kaiser, "An Objective Method for Establishing Legislative Districts," *Midwest Journal of Political Science*, 10 (May, 1966), 200-23. James B. Weaver and Sidney W. Hess, "A Procedure for Non-partisan Districting: Development of Computer Techniques," *Yale Law Journal*, 73 (December, 1963), 288-308. For the use of such measures in other problems, see: Ronald B. Boyce and W. A. V. Clark, "The Concept of Shape in Geography," *Geographical Review*, 54 (Oct. 1964), 561-72; D. H. Blair and T. H. Biss, "The Measurement of Shape in Geography: An Appraisal of Methods and Techniques," *Bulletin of quantitative data for geographers*, 11 (University of Nottingham, 1967).

¹² This justification for considering shape in redistricting is more explicitly recognized in the British context where size and shape are related to problems of accessibility within a constituency; see David Butler, "The Redistribution of Seats," *Public Administration*, 33 (1955), p. 127.

Figure 1. Proposed Congressional Districts: Iowa 1971

The application of I_A to the assessment of electoral districts is relatively simple. Any electoral district boundary may be generalized as a series of straight line segments between base area junctions.¹³ (Obviously, we do not wish to consider indentations arising from base unit boundaries [rivers, coastlines, etc.] beyond the control of the districting procedure.) With electoral districts in this form, I_A may be easily calculated, thus permitting measurement of the degree of indentation of the district in terms of the base unit junctions where the ultimate districting decisions are made.

We can briefly illustrate the application of this measure using the Iowa Congressional Districts approved by the Iowa legislature in 1971. All six proposed districts exhibit indentations, and so we can expect I_A values of less than unity. To measure the degree of indentation we initially enumerate the number of base area junctions on a district's boundary, since each of these represents a decision on the part of the districting agent. Iowa's First Congressional District, for instance, has 24 base area junctions on its border. Of these, seven produce internal reflexive angles so that $I_A = (17-7/24) = 0.42$. The I_A indices for the other five districts can be similarly calculated producing the following results: 2nd—0.47; 3rd—0.68; 4th—0.52; 5th—0.64; and 6th—0.69.

Let us now consider the uses to which this shape measure can be put. Clearly it cannot be used as an absolute criterion since other factors such as population equality—might well be violated by a system of neat convex districts. In any case, a control on district shapes in no way prevents gerrymandering, since the required pattern of districts for unfair districting will depend on the underlying distribution of voter preferences.¹⁴ Dixon concedes, however, that: "A rule

of compactness and contiguity, if used merely to force an explanation for odd-shaped districts, can have much merit."¹⁵ The I_A index seems particularly well suited to this role of evaluating proposed district patterns. By concentrating on indentations, it pinpoints divergences from convexity and thus may be used to "force an explanation." In our Iowa example it is immediately apparent that the three districts with low I_A values (1, 2, 4) include those counties (Polk, Linn, Dubuque, Johnson, Des Moines) from which the state's minority party, the Democrats, draw most support. The explanation that this suspected gerrymander forces, relates to the greater need for indented boundaries in this part of the state because of its uneven population distribution. At a more specific level, however, the two I_A values below 0.5 for the First and Second Districts do invite comment on their shapes particularly with regard to their common boundary. In effect this boundary locates Johnson County in the Republican First District thus "wasting" Democrat votes that the Democrats would much prefer to have in the more marginal Second District. No doubt this can be justified on population equality grounds although our boundary analysis does suggest a partisan effect from this neutral population criterion.

In this paper I have tried to develop a shape measure for evaluating electoral districts from an initial abstract consideration on the concept of shape. We are now in a position to return to the more exciting world of gerrymanders. Thus the most famous recent gerrymander, Tuskegee's "24 sided sea-horse"¹⁶ encloses 12 reflexive angles and so has maximum indentation scoring zero on the I_A index. We can therefore conclude that, at the very least, I_A identifies the extreme cases. Furthermore, we now have a new tool specifically designed to force explanations of odd shaped districts that is relatively easy to interpret and can be easily understood and therefore used by professional and layman alike.

¹³ Schwartzberg ("Reapportionment," p. 447) terms these points "trijunctions," since the base area boundaries meet in threes.

¹⁴ This point is particularly well developed by Robert G. Dixon, *Democratic Representation: Reapportionment in Law and Politics* (London: Oxford University Press, 1968), Chapter 18. See also Peter J. Taylor, "On Some Implications of the Spatial Organization of Elections," *Transactions, Institute of British Geographers* (forthcoming, 1973).

Politics and the Budgetary Process

By an impressive margin the federal government spends more money, does more things, and affects more people than it did twenty-five, or even ten, years ago. But the record of innovation and expansion has not been uniform; rather the prosperity of individual programs has varied widely during this period. Some programs have continuously prospered, grown, and evidently become permanent fixtures in the governmental system: farm commodity supports, highway construction, Social Security, and, most recently, health care. Others seem to have thrived only temporarily: aircraft nuclear propulsion, manned space flight, and the "Green Berets"; while still others have an uneven history of success and failure and are constantly involved in political turmoil: AID, Model Cities, and the Atomic Energy Commission's "Plowshare" program.

What is responsible for the success or failure of governmental programs? Who (or what) determines our national priorities? Political scientists have long regarded the budgetary process as the richest source of evidence on these matters. The assumption has been that the budgetary process, the most important "action forcing" mechanism in government, reflects the aspirations and controversies which cause some programs to be favored over others. Within the budgetary process clashes of interest and priority should be expressed in real dollar terms. Evidence concerning the goals of program directors and clients, the support of agency heads, the surveillance of the Office of Management and Budget (formerly the Bureau of the Budget), the strategic choices of the president, and the influence of Congress should all be contained in the data generated annually by the federal budget cycle.¹

* The authors wish to thank Don K. Price, Dean of the John Fitzgerald Kennedy School of Government, and Richard G. Hewlett, Chief Historian, United States Atomic Energy Commission, for their advice and counsel. We have benefited also from the suggestions and criticisms of Professors Arthur Maass and Douglas Price of Harvard University.

¹ The "traditional" literature on the budgetary

process is immense. The text and references in either Arthur Smithies, *The Budgetary Process in the United States* (New York: McGraw-Hill Book Company, 1955), or Jesse Burkhead, *Governmental Budgeting* (New York: John Wiley and Sons, 1956), provide convenient guides. Of particular interest are: Richard E. Neustadt, "The Presidency and Legislation: The Growth of Central Clearance," *American Political Science Review*, 48 (September, 1954), 641-671; Arthur Maass, "In Accord with the President's Program," in C. J. Friedrich and K. Galbraith, eds., *Public Policy*, 4 (Harvard University Press, Cambridge, Mass., 1954), 77-93; Fritz Morstein Marx, "The Bureau of the Budget: Its Evolution and Present Role," I and II, *American Political Science Review*, 39 (August and October, 1945), 653-684 and 869-898; and Lucius Wilmerding, Jr., *The Spending Power* (New Haven: Yale University Press, 1943). The notion of an "action forcing" mechanism is, of course, Richard E. Neustadt's.

The notion of an "action forcing" mechanism is, of course, Richard E. Neustadt's.

² Aaron Wildavsky's highly influential *The Politics of the Budgetary Process* (Boston: Little, Brown and Co., 1964) is the watershed. The ideas embodied in this analysis were more precisely formulated in Otto A. Davis, M. A. H. Dempster and Aaron Wildavsky, "A Theory of the Budgetary Process," *American Political Science Review*, 60 (September 1966), 529-547. See also, by the same authors, "On the Process of Budgeting: An Empirical Study of Congressional Appropriations," in *Papers on Non-Market Decision Making*, ed. Gordon Tullock (Charlottesville: Thomas Jefferson Center for Political Economy, 1966), pp. 63-133. This general analytic approach has been importantly extended by John P. Crecine. See his "A Computer Simulation Model of Municipal Resource Allocation" (paper delivered at the Midwest Conference of Political Science, April, 1966), as well as *Governmental Problem Solving* (Chicago, Ill.: Markham Pub. Co., 1969). See also Ira Sharkansky, *The Routines of Politics* (New York: Van Nostrand, 1969).

given period pretty much determines what will happen in subsequent periods.

There is, of course, an important element of truth in these findings. Administrative budgets are not rewritten from scratch every year; and it is a little silly to judge the consequences of policy innovations as if they were. Further, it is undoubtedly true that political historians (and public administrators) often exaggerate the importance of particular policies, choices, and competing personalities. After all, they find the business of public administration interesting precisely because it embodies great controversies between powerful forces—conflicts which seem both to be inherent in and to shed light upon the process of popular government.

Still, the gap between traditional and quantitative approaches to the budget remains. It is not enough to dismiss the conclusions of the older school out of hand, as the product of too much enthusiasm for public administration and the inevitable result of unsystematic research. Much of the traditional literature comes from men who in fact have served in government—participant observers, if you will—and their description of the central role of the budgetary process as a policy vehicle is important if only because that is what they saw happening.

The challenge of the quantitative budget studies is precisely over the question of how much public policy is embedded in the budgetary process. Their argument is that administrators rarely depart significantly from what they are already doing. They "muddle through" as best they can, making only marginal changes in the established operations of government. Consequently, agency budgets are massively stable from one year to the next.³ Bureaucratic behavior and the budgets that result from it seem to reduce to a simple set of operating principles that, at the same time, leave no room for other explanations.

The most striking fact about the equations [which describe the budgetary process] is their simplicity. This is perhaps partly because of the possibility that more complicated decision procedures are reserved for special circumstances represented by extreme values of the random variable. However, the fact that the decision rules generally fit the data very well is an indication that these simple questions have considerable explanatory power. Little of the variance is left unexplained.⁴

³ See in this regard Charles Lindblom, "The Science of 'Muddling Through,'" *Public Administration Review*, 29 (Spring, 1959), 79–88; and Charles Lindblom, *The Intelligence of Democracy: Decision Making Through Mutual Adjustment* (New York: The Free Press, 1965).

⁴ Davis, Dempster, and Wildavsky, p. 543.

In the end, this line of reasoning may yet provide a new and strong foundation for the study of public administration. However, it may be also that the relationship between public policy and the budgetary process has been obscured by the way the problem has been quantified.

The theme of this essay is that the political choices and conflicts inherent in the administration of government have been unnecessary casualties of the quantitative revolution. The problem is essentially one of theory. After reviewing the theoretical underpinnings of the quantitative budget studies we will suggest an alternative approach to the manipulation of budgetary data, developing along the way a methodology that will uncover controversies over policy and priorities.

The Incremental Model of Budgeting

The budgets of federal agencies are developed over a period which begins as much as eighteen months before appropriations requests are acted upon by the Congress. During this period agency budgets are typically formulated to meet the guidelines established by the OMB speaking for the president and his administration. The initial budgets normally undergo a sequence of successive reductions and appeals often culminating in a presidential review.

The budgetary process itself is composed of six stages, though the precise pattern that is followed may vary slightly by agency and department, particularly in the final stages of appeal and presidential review. The process begins with the budget guidelines that are sent down by the OMB. These are deliberately varied from year to year so as to communicate to the bureaucracy a sense of limited resources and to direct attention to items that happen to be of particular concern to the administration. Usually agencies will respond to the OMB by preparing "flash estimates" or "preview budgets." These budgets serve to begin the process of negotiation, and, in the weeks that follow, a series of informal estimates are established indicating how much expansion is likely to be considered reasonable in light of the administration's priorities.

On the basis of this information, the agency's comptroller begins to aggregate budget requests from the operating divisions within the department or agency. Of course, division requests regularly exceed the amount of money that, according to the OMB, will be available. Hence these estimates are worked over by the comp-

troller with an eye towards bringing them in line with administration expectations.

The comptroller's recommendations along with each division's request constitute the material from which an agency budget is produced. It is during this part of the process that competition *within* the agency (or department) reaches its greatest intensity. Each division struggles for funds against the budgetary interests of the other operating divisions, each trying to avoid the heavy hand of the comptroller by shifting the burden of budgetary cuts to some other division's programs.

The easiest way for a division to protect itself is, of course, to gain the support of the department secretary or agency chairman. But the competition for funds often extends beyond the administrative framework in which the operating divisions are located. Thus, it is not unusual to find program directors drawing in other elements of government—congressmen, other bureaus and departments, consultants, lobbyists, etc.—in order to gain some vital budgetary advantage. (Admiral Rickover, for one, was so skilled at managing his congressional support that he operated virtually outside the normal review procedures of the AEC.) The department or agency must now produce a series of budgetary settlements that compromise the demands of its working parts along with the push and pull of external political forces while, of course, trying to hold to OMB guidelines.

The budgetary outcomes at this stage of the process become formal requests to the president for funding and are sent to the OMB for review. Acting "in accordance with the President's program,"⁵ the OMB "marks up" each budget, item by item, program by program—cutting away wherever it can, accepting other requests as submitted, and occasionally, adding money to some project that the administration looks upon with special favor. For the managers of the federal bureaucracy, this is the most difficult part of the process, because it threatens to unbalance the blend of policies and priorities that has been arranged among a department's working parts. Yet the entire thrust of the OMB at this point is to attack budget requests that have produced unnecessary and expensive settlements. Budgets then are normally marked up with a heavy hand and returned to those who wrote them for reconsideration.

Here the agency or department has a choice: it can accept the OMB's actions as they stand

or it can appeal to the OMB for some measure of restoration. It is important to note here that any further budgetary action by either the president or the OMB occurs only over contested items in the budget. Those items not disputed by the OMB or subsequently returned to the OMB by appeal are regarded as a settled part of the administration's budget. Thus, the budget is now agreed upon for the most part with only a small number of controversies remaining.

The OMB reconsiders those matters that are still disputed and again leaves the agency or department with a choice. Again the decision of the OMB can be accepted, thus settling the matter. There is, however, also the alternative of appealing the OMB's final action directly to the president. It is understood that each agency chairman or department secretary can argue for restorations directly before the president, much like a knight pleading before his king for special favor. The president's decision, of course, ends the process and the results are printed up and sent along to Congress (where specific issues can be reopened). Several things ought to be noted about the presidential budgetary reviews. The first is that this stage is centered on specific budgetary items and does not usually include a general review of the agency's or department's budget. Second, it is in these last stages of appeals that the budgetary process varies most widely. These variations usually reflect the relative stature of particular branches of government. (Thus military budgets, for example, have a preferred status in the appeal process.) Also, it is at this point that the standing of the department's chief administrator is determined. It is he who must go before the president and argue for funds that are presumably vital to his department's functions. Consequently, the degree of success that he has with the president is widely regarded as an evaluation of his administrative worth and, at the same time, a measure of the importance that agency or department has in the administration.

By design, then, the budgetary process produces a climate of scarcity in which the success of those who participate is measured by the number of dollars they are able to win. Indeed, the entire process of formulating budgets within agencies plays upon the institutional interests of bureaucrats so as to produce the explicit competition between alternative "policies."⁶

⁵ See Arthur Maass, "In Accord with the President's Program," for an excellent discussion of the great subtlety and variation with which this phrase is used.

⁶ For a thorough review of one such cycle, see Irvin C. Bupp, "Priorities in Nuclear Technology: Program Prosperity and Decay in the USAEC, 1956—

This competition among alternative programs seems to have been all but lost in the work of Davis, Dempster, and Wildavsky. These scholars have argued that agency budgets are produced by relatively straightforward incremental strategies and hence are not often an especially interesting source of conflict, not to mention change and innovation.⁷ Specifically, they have examined the variations in fifty-six nondefense federal agencies from 1947 to 1963 and discovered that they can be explained very simply by a "set of simple decision rules that are linear and temporally stable."⁸ In their most sophisticated equation (decision rule), Davis, Dempster, and Wildavsky argue that the congressional appropriation of any agency is

... a fixed mean percentage of the agency's request for a certain year plus a fixed mean percentage of a dummy variable which represents that part of the agency's request for the year at issue which is not part of the appropriation or request of the previous year plus a random variable representing the part of the appropriation attributable to the special circumstances of the year.⁹

This is to say that appropriations subcommittees normally give an agency some proportion of what it asked for, adjusted by things in dispute and special considerations peculiar to a particular year.

The point that Davis, Dempster, and Wildavsky most emphasize is that their decision rules fit the data: "... the results are very good. We leave very little of the variance statistically unexplained."¹⁰ In fact, for the majority of congressional decisions (appropriations) their equations yield R's exceeding 99 per cent, and for all but two show R's above 90 per cent. Further, these decision rules seem to square neatly with other research which suggests that the budgetary process in appropriations subcommittees has become an institutionalized se-

ries of actions sanctioned by an elaborate set of norms and behaviors.¹¹

The creative insights upon which Wildavsky and others have built are contained in the writings of Herbert Simon and his colleagues.¹² The theme of this work is that people are quite limited in their ability to process new information, generate alternatives, anticipate consequences, and weigh values. The Simon-Lindblom administrator faces a highly complicated world, a world of multiple values and goals related to each other in unknown ways. He has no very reliable way of predicting the consequences of alternative courses of action and little information pertinent to assessing these consequences even if he had an acceptable theory. As Crecine has put it,

[He] is a man with limited knowledge, limited information, and limited cognitive ability, making a policy choice in an uncertain world by "drastically" simplifying the problem and making marginal adjustments in past "successful" policies to formulate current policies.¹³

The phrase that captures the essence of the administrative situation is "organized complexity."¹⁴ And nowhere are its consequences more apparent than in the making of budgets. The budgetary process is, after all, a complicated procedure in which officials are usually under the intense pressure of time and circumstance. One expects that whatever decision rules have worked in the past will be used again in the solving of current disputes. Indeed, one does not expect the level of disagreement to be very high, because individual administrators can be

1971" (Ph.D. dissertation, Harvard University, 1971), chap. 1.

⁷ Davis, Dempster, and Wildavsky, pp. 540-543, do make explicit provision for deviant cases in their analysis. These are cases that lie beyond the normal rules of budgeting that they describe; they are also cases that presumably involve controversy, change and innovation in the budgetary process. This line of thought is further developed in their subsequent article: "On the Process of Budgeting II: an Empirical Study of Congressional Appropriations," *Studies in Budgeting*, eds. R. F. Byrne, A. Charnes, W. W. Cooper, and D. Giffords (North Holland, Amsterdam, 1971), pp. 292-375.

¹⁰ Davis, Dempster, and Wildavsky, p. 537.

expected to request funds for what they are already doing, give or take a little bit.

These observations are all quite true as far as they go. Across aggregations of decision-making units (federal agencies, municipal administrations or individual budget-makers), behavior at time "T" can be shown to be a robust function of comparable behavior at "T - 1." What is striking is that administrative behavior is so very similar in all sorts of diverse organizations. State governments, business organizations, labor unions, organizations of every sort seem to promote the same sort of responses from those who administer them, responses that are rationalized in budgetary processes that do not seem to vary widely in effect from organization to organization.¹⁵

The trouble is that in politics the budgetary process, while certainly responding to the requirements of administrative life, is also a battlefield for conflicting priorities and alternative policies. The categories of analysis established by Wildavsky, Crecine, and others help us to understand the behavior of the pertinent decision maker as he attempts to resolve the problems that he faces. But this line of reasoning does not shed much light upon the sort of things which over time cause some activities to become the continuing policies of government while others fade and are discarded. It is this variation in the *competitive* success of alternative programs, rather than the cognitive processes of decision makers, which is central to the politics of public administration. It is this aspect of government that the "problem solving" perspective is inherently unable to explain.

Let us stress again that we are not quarreling with descriptions of administrative behavior. Quite to the contrary, our argument is premised on the findings of Simon, Lindblom, Cyert and March, and Wildavsky. Administrators in complex organizations *behave similarly*. However, accounting for these patterns of administrative behavior—itsself vital to the science of public administration—is not the focus of our problem. We want to explain why some programs are repeatedly funded while others are considerably less successful, *given* that the behavior of their administrators is likely to be quite similar. This is to say that we are looking at a different level of public administration. Our focus is not on the behavior of administrators, *per se*,

but on administrators as they are organized in terms of policy outputs, programs as they compete for dollars.

In a sense budget data present us with a measurement problem: *How are yearly government budgetary figures reordered so that they indicate policy choices and public priorities?* This is by no means an easy question to answer. For the budget reflects simultaneously a yearly *process of administration* and decisions among *alternative political priorities*. That is, budgets are at once measures of the way government is organized and of the policy decisions that the organization implements. Obviously, these are not the same things although they are nested within the very same data.

The fact that political choices and the budgetary process are so completely intertwined accounts for much of the confusion among approaches to public administration. What has happened is that the traditional scholars have spoken of public administration without placing it within the context of an annual, stable budgetary process. Thus, they have tended to write about policy as if that were the only thing that government was producing. In discovering that there is, in fact, a budgetary process in administration, younger and more quantitatively trained researchers assumed that the process of government, in addition to producing budgets, produced settlements on questions of public policy. Here the quantitative approach was a victim of its own theoretical and statistical precision. The budgetary process models worked so well that there simply did not seem to be anything left to explain.

The reason for the great statistical success of the quantitative budget studies lies in the fact that *agencies* were taken as the unit of analysis, yearly budget cycles being nothing more than replications of the same event over time. These data yielded to Wildavsky and his associates a simple set of equations (decision rules) that, by and large, seemed to describe how public policy is formulated while reserving more complex and sophisticated political strategies for a small number of "deviant cases." What has been captured—quite accurately—by this formulation is the great stability of the administrative structure of government. But because administrative categories have formed the basis of budgetary analysis, the entire process in which public policy is produced has been obscured.¹⁶

¹⁵ Compare: Thomas Dye, *Politics, Economics, and the Public: Policy Outcomes in the American States* (Chicago: Rand McNally and Co., 1966) with Cyert and March, and William Leiserson, *American Trade Union Democracy* (New York: Columbia University Press, 1959) with Crecine.

¹⁶ In policy terms, the entire metaphor of normal and deviant cases is vastly misleading. With it, Davis, Dempster, and Wildavsky promote the idea that bureaucracy is largely inert, proceeding to do today

The first step, then, in untangling information on policy choices from data on the administration of government is to shift the level of analysis for agencies and departments to programs. This is to say that in the context of the budgetary process, programs are the operating units of public policy, that they provide "categories that are closer to being true outputs [of government] than the older categories."¹⁷

It should be noted, however, that it is difficult to make explicit comparisons *between* program budgets (although even with the data in this form a great deal can be done).¹⁸ Programs vary widely in their scope, size, and content, and these differences are unfortunately reflected in their budgets. The amount of money necessary to fund a strong cancer research program differs substantially from the funding necessary to lift the incomes of the elderly above the "poverty line." Similarly, reducing the army's manpower budget by 100 million dollars has a markedly different effect from taking the same number of dollars away from OEO. In a fundamental way, then, all budgetary dollars are not equal; and while all policy outcomes

are expressed in terms of dollars, some care must be taken to make this information commensurate across programs. This is to argue that merely shifting to programs as the basis of policy analysis is not in itself sufficient, that budgetary data organized by programs must themselves be transformed so that the relative prosperity of programs in the policy process can be measured and compared.

It should be added, finally, that programs have histories of support and opposition, and focusing explicitly on them returns this dimension to budgetary analyses. Agencies (or departments) usually do not have such histories associated with them (except in their first years of operation). They are normally accepted as part of the fixed institutional landscape, terrain that seems to change dramatically only during periods of great crisis and political turmoil. An important lesson of the Eisenhower and Nixon Administrations is that changing the party in power does not open up already established agencies to direct attack. However, the relative priorities for programs within an agency (and even the relative standing of the agency as a whole) do vary quite widely from administration to administration, even though the agency continues as an established part of government.

Thus, the salient characteristic of established agencies and departments is their stability—both organizational and budgetary. And again, it is this aspect of government that Wildavsky and others have captured so well. Yet within departmental and agency boundaries (and occasionally between them, e.g., the case of OEO) there is a constant struggle by program directors, lobbyists, congressmen, state and local politicians, and White House personnel to fund new ideas and to continue the funding of old ones. It is a competition that draws to it people and institutions with radically different ideas and purposes; and that decides, in the end, what public policies we are to have.

From this perspective the struggle to establish new public policies looks very much like the competitive ideal in nineteenth century capitalism. Entrepreneurs—"policy entrepreneurs," if you will—seek scarce resources for their programs. In their quest for funding and political authority, they use every available weapon: pressure from various constituencies and groups, aggressive selling inside government, attracting congressmen as innovators or as protectors (congressmen who in turn often lobby other congressmen), pressuring the White House as well as receiving pressure from the White House, and so on through a diverse range of opportunities and strategies. The fact

essentially what it did yesterday, all without competition and controversy. The exceptions, by this logic, are reserved for a small number of deviant cases which involve "more complicated decision procedures."

The entire thrust of our argument is that the logic of the budgetary process involves public policies in a continuous struggle for scarce resources; that, if there is any "normal state of affairs" in the policy process, it is one of intense competition between programs for public funds. Further, this logic holds equally for policies that desire nothing more than to continue to do what they were doing last year. There is nothing simple or automatic about continuing. Again we must stress that we are speaking of policies and programs here, not the administrative framework in which they are managed. Thus when Davis, Dempster, and Wildavsky (pp. 544-545) suggest that the analysis of individual programs follows from the broad outlines established in their own work, we must respond that their emphasis on normal and deviant cases has started such research off in the wrong direction.

¹⁷ Roland N. McKean and Melvin Awshen, "Limitations, Risks and Problems," in *Program Budgeting: Program Analysis and the Federal Budget*, ed. David Novick (Cambridge, Mass.: Harvard University Press, 1965) p. 286.

¹⁸ For a thoughtful discussion which complements many of these points, see Charles L. Schultze, *The Politics and Economics of Public Spending* (Washington, D.C.: The Brookings Institution, 1968). Indirect, but vivid, support for many of the same arguments can be found in Charles L. Schultze, Edward R. Fried, Alice M. Rivlin, and Nancy H. Teeters, *Setting National Priorities: The 1972 Budget* (Washington, D.C.: The Brookings Institution, 1971). And at the municipal level see John E. Jackson's perceptive essay, "Politics and the Budgetary Process," *Social Science Research*, 1 (April, 1972) 35-60.

that political strategies vary widely as a result of the peculiar combination of resources that happens to be available probably explains why "the case study method" of public administration was never able to produce a cogent set of generalizations. But this should not be taken as evidence that there is no struggle, that the process is one of slow, incremental change. Rather it suggests that the policy process in the United States is an open one where all sorts of influences are at play, and where—because the process is a long and complex one (six stages plus congressional action over more than eighteen months)—the competition between policies is reinforced and accentuated.

The Case of the AEC

To make these thoughts more concrete, let us turn to the activities of a particular federal agency: the Atomic Energy Commission. Though now a mature agency with established purposes and programs, the AEC was created and in many ways has continued to exist in an atmosphere of uncertainty and conflict about the appropriate applications of a new and poorly understood technology.¹⁹ Was nuclear technology to be applied exclusively to the development of weapons? Or were its applications ultimately to be essentially civilian and peaceful? Could peaceful applications be carried out with economy and safety? By whom, and under whose supervision? These and other questions have defined areas of sharp conflict among philosophies of government and among programs and personalities. The early history of these disputes has been compiled and is presently being published as a multivolume study of the Atomic Energy Commission.²⁰ A definitive account of the programs and controversies that developed over the years within the AEC, this material provides a rich historical context against which we can examine the AEC's activities as they are reflected in the agency's budgetary records. Perhaps more important, how-

ever, are the specific characteristics of the actual budgetary records upon which we have been able to draw. First, we have been able to identify and trace the histories in whole or in part of twenty-three distinct AEC programs during the period of 1958–1972. While these programs do not represent an exhaustive categorization of all AEC activities, they are all "real" programs as distinct from mere projects on the one hand or "accounting categories" on the other. The twenty-three identified programs are mutually exclusive but are not exhaustive of all Commission activities, comprising on the average about 90 per cent of any given year's total AEC operating budget.²¹

Second, within each of the fifteen "budget cycles," FY 1958–FY 1972, we have isolated six discrete stages beginning with the program divisions' requests to the Commission's general manager and ending with the official presidential budget for a given year. The intermediate stages represent the general manager's recommendation to the Commission; the Commission's "September" submission to the Administration; the OMB's "mark-up" of that submission; and the "appeal" of the "mark-up," either to the Office of Management and Budget or the president.²² Consider now the data reflected in Table 1.

In Table 1 we have ignored the programmatic breakdown of the fifteen AEC budgets and have simply correlated the requests for allocations for each stage across the fiscal cycles for which we have data. For these fifteen observations, the funds requested at a given stage correlate almost perfectly with that requested at a previous stage and that granted at a subsequent stage. The perfection of these correlations is powerful support for Wildavsky's basic argument about the regularities of the budgetary process, but it suggests very little about the political conflicts which we *know* were taking place during the period spanned by this data.

¹⁹ James R. Newman and Byron S. Miller, *The Control of Atomic Energy* (New York: McGraw-Hill Book Co., 1948). See also David E. Lilienthal, *The Atomic Energy Years, 1945–1950* (New York: Harper and Row, 1964).

²⁰ Richard G. Hewlett and Oscar E. Anderson, Jr., *The New World, 1939–1946, A History of the USAEC*, Vol. 1 (University Park, Pennsylvania: Pennsylvania State University Press, 1962); Richard G. Hewlett and Francis Duncan, *Atomic Shield, 1947–1953, A History of the USAEC*, Vol. 2 (University Park, Pennsylvania: Pennsylvania State University Press, 1969). A separate study of the Naval Nuclear Propulsion Program has also been prepared by Richard Hewlett and Francis Duncan and is scheduled for publication in the Fall of 1973.

²¹ One of the authors (Irvin Bupp), was for several years on the staff of the secretariat of the AEC and hence had access to the agency's internal financial records. This association led to AEC support under the auspices of the Office of the Historian for the research reported here.

It is perhaps also worth noting that the AEC is one of the very few executive agencies to have followed a generally consistent "output" format in its budgetary practices since its creation. This fortunate circumstance considerably simplified the problem of isolating and tracing distinct programs.

²² This fifth "appeal" stage is the only one not strictly comparable across all fifteen years. Records of this process were often difficult to locate, and for FY 1959 and FY 1960 there is no evidence that an "appeal" as such was allowed at all.

Table 1. Correlations Between Budgetary Stages for 23 AEC Programs Pooled Across FY 1958-FY 1962

	Division	General Manager	AEC	OMB	Appeal	Presidential
Division	1.000					
Gen'l Mgr.	.996	1.000				
AEC	.997	.999	1.000			
OMB	.995	.998	.997	1.000		
Appeal	.996	.997	.997	.998	1.000	
Final	.995	.996	.997	.998	.999	1.000

For, within this apparently stable framework, five substantial AEC programs were cancelled altogether, two major activities experienced a sharp monotonic decline in their fortunes, three grew impressively, and most others fluctuated widely. Moreover, the picture is not very much different at the program than at the agency level.

When requests and allocations are correlated at the program level there is on the whole less close association across stages but the average magnitude of the correlation coefficients is still quite high. Most are in the .80-.90 range, and out of twenty-three programs only four show associations of less than .70 between pairs of stages. So, even at places where conflict is *known* to have occurred, the budgetary process perspective merely uncovers "striking regularities." Simply changing the units of analysis, that is to say, does not uncover the underlying political competition that structures the process of policy formulation; a more profound change is required.

It is at this point that we come to manipulating budgetary data themselves, to transforming dollars so that they will better reflect the competitive struggle for growth, for continued (or renewed) prosperity. The elements that we have to work with are: the agency in which programs operate (i.e., the administrative context), the past success or failure of a program in obtaining funds, and the action that is taken on program requests as they pass through the budgetary cycle (i.e., a program budget from initial request to final presidential decision).²³

²³ Congressional action is not included in our calculations, although a good case could be made for doing so. Congress is, after all, quite active in the budgetary process through its committee and subcommittee system; see Fenno, *Power of the Purse*. We are concerned, however, with the formulation of program budgets, not with their review. Congressional review of the budget really moves on to a different level of analysis. Of course, much of congressional influence is informal. As such, it should be entered into any explanation of why some programs prosper and others fail. This is again a different analytical problem from

The raw data, of course, come in the form of absolute dollar levels of programs from year to year. And it is by transforming and recombining these data that we hope to create an "index of prosperity" which will reflect the relative political success or failure of programs as they compete for scarce resources. Such an index has to meet two different problems of comparability.²⁴

The first has to do with the variation in the total AEC operating budget between FY 1958 and FY 1972, which was, of course, by no means constant over that period. In Table 2 below, we have computed the sum at each stage of the twenty-three programs on which we have calculated data. It varies from year to year, ranging from a low of \$2006.3 million in FY 1967 to a high of \$2568.5 million in FY 1963.²⁵

It seems reasonable to argue that programs are equally prosperous only if each preserves its proportion of the total even as the total changes *both* from year to year *and* across the stages of budgetary process. A first step, then, toward operationalizing the notion of "prosperity" is to divide all program allocations at all stages by the total for that stage. This procedure, however, leads to a second problem of comparability.

There is great variation in the absolute magnitude of program budgets. Among the twenty-three AEC programs for which we have data, several have budgets in the \$5-\$10 million

developing an index of program prosperity—the results of which can then be searched for appropriate causes.

²⁴ For a somewhat different, but also highly imaginative, approach to this problem, see John Jackson, "Politics and the Budgetary Process."

²⁵ For any given year or stage, the totals reflected in Table 2 are equal to about 90 per cent of the comparable total operating budget, the remaining 10 per cent being that portion of the AEC budget which we were unable to allocate to meaningful output categories. Since we are explicitly interested in competition among programs, the aggregated totals shown have been used as the basis for the transformation described in the text.

Table 2. Total at Each Budget Stage for 23 AEC Programs
(In \$ millions)

Fiscal Year	Division Request	General Manager	Commission	OMB	Appeal	Final
1958	\$2170.9	\$2059.1	\$2199.1	\$2081.2	\$2083.2	\$2076.6
1959	2414.9	2235.4	2267.9	2253.9	2253.9	2252.3
1960	2575.7	2501.7	2510.9	2447.5	2472.7	2451.0
1961	2494.3	2409.6	2368.8	2206.6	2310.3	2296.4
1962	2538.7	2499.2	2491.1	2285.3	2306.5	2343.0
1963	2586.2	2428.7	2447.5	2389.8	2592.3	2568.5
1964	2781.2	2468.5	2586.6	2366.7	2548.3	2381.4
1965	2505.1	2428.1	2447.0	2294.5	2283.1	2239.6
1966	2323.8	2251.4	2257.4	2104.0	2195.3	2129.1
1967	2213.6	2098.1	2118.2	1986.0	2034.4	2006.3
1968	2399.9	1999.1	2110.1	2005.8	2053.6	2026.4
1969	2438.2	2272.8	2269.8	2151.7	2225.3	2180.5
1970	2376.0	2238.9	2274.4	2104.8	2169.9	2037.4
1971	2469.4	2285.1	2303.9	2024.4	2121.0	2013.7
1972	2420.7	2179.5	2150.7	1962.6	1990.2	1980.5

range, and a few have budgets that were greater than \$400 million. The obvious consequence is that each of the smaller programs is a tiny proportion of the total agency budget and is thus "lost" for analytical purposes. For example, one of the most politically controversial AEC programs is "Plowshare," a project to develop nonweapons applications for nuclear explosives. This program has never commanded more than one per cent of the total Commission budget.

We need to normalize the percentages obtained by dividing each program budget by the appropriate total so that these small programs are not made to seem insignificant out of sheer tininess. To adjust for this problem we have first calculated for each budget stage a program's *mean* proportion of the total for that stage across either (a) all the years spanned by our data, or (b) when a program began or was cancelled within that period, the years during which the program existed. We have then divided a program proportion of the total for each stage/year by this mean and multiplied the quotient by 100, converting to a percentage. The effect is to normalize these percentages so that they average 100 for the period FY 1958-FY 1972, or, when appropriate, for the years a program existed. We believe that the characteristics of this index and its behavior over time are highly suggestive of the process of competitive growth, i.e., "prosperity" in which we are interested. Eventually we shall want to use "prosperity change scores." This is the numerical difference of the prosperity scores across years for a given stage and will be

zero when a program's proportion of the stage total does not change over the years.

At this point, it is useful to state these arguments more formally. For a full array of budget observations for programs over a number of years across each budget stage, $D_{(i,j,k)}$, where

i = programs (1-23 in the case of the AEC),

j = a specified budget stage (1-6),

k = years,

T = Total agency budget for the sum of all programs

the corresponding array of prosperity scores, $P_{(i,j,k)}$ is defined as:

$$P_{(i,j,k)} = (Pr_{(i,j,k)} / \text{mean } p_{(i,j)}) * 100$$

where

$$(a) \quad Pr_{(i,j,k)} = D_{(i,j,k)} / T_{(j,k)}$$

for

$$T_{(j,k)} = \sum_{i=1}^{23} D_{(i,j,k)}',$$

and where

$$(b) \quad \text{mean } p_{(i,k)} = T p_{(i,j)} / Ic_{(i,j)}'$$

for

$$T p_{(i,j)} = \sum_{k=1}^{15} Pr_{(i,j,k)}',$$

and

$Ic_{(i,j)}$ = the number of years for which the i th program in the j th stage > 0 .

Table 3. Four AEC Program Histories Expressed as "Prosperity Scores"

Fiscal Year	Rover (Nuclear Space Rocket)	High Energy Physics	Sherwood (Controlled Thermonuclear Research)	Nuclear Weapons (Research, Develop- ment and Production)
1958	25	20	87	69
1959	19	25	95	75
1960	28	34	130	67
1961	34	36	95	68
1962	56	51	88	80
1963	128	82	86	94
1964	187	118	83	92
1965	165	107	80	109
1966	174	122	92	105
1967	173	144	103	104
1968	131	149	108	110
1969	145	147	109	122
1970	103	156	114	129
1971	94	154	123	133
1972	33	150	97	136

In Table 3 we present the scores for four programs within the AEC, all of which show striking variance in prosperity. In fact, all twenty-three programs exhibited a lively and theoretically interesting variance, but limitations of space preclude discussing them all.²⁶

We see quite vividly the growth, decay, and fluctuation of which we have spoken—all within the context of a roughly constant total budget. These variations were caused by political events, not the operation of a budgetary process. The sudden reversals in the fortunes of "Rover" were caused by various officials of three administrations having attached sharply different priorities to the undertaking. The competitive success of high energy physics resulted in part from the constant attention of the Atomic Energy Commission Chairman with a strong interest in pure research. High energy physics did not grow "accidentally" or "naturally"—indeed none of these curves represents any sort of "natural process." On the contrary, each is the record of a sequence of priority settings made within a political system. Programs do not naturally grow, decline, or remain constant, or anything else. They are caused to do all of these by politicians and administrators making often difficult choices among competing claims upon scarce resources.

This "authoritative allocation of values" is the essence of the political process, a process that is vividly portrayed in these prosperity scores. The relative stability of "Sherwood" (controlled thermonuclear research) is not an

illustration of organizational process in Lindblom's terms.²⁷ Sherwood has remained constant, has *resisted* competing claims upon its share of the Commission budget, only because it has been supported by the Commission, the Office of Management and Budget, and the president. Its constant level of prosperity is an indicator of stable political support, not of the operation of some "budgetary constant." Its support could have evaporated completely much like the nuclear rocket program's (Rover)—a program which received high priority in the early years of the Kennedy administration only to be completely abandoned.

Alternatively, consider the history of weapons. This has been a truly prosperous enterprise and one with an especially suggestive administrative history. The circumstances surrounding the 1950 presidential decision to build thermonuclear bombs left the Atomic Energy Commission with little influence over the future of this program.²⁸ The function of the Commission came to be one of merely fulfilling requirements for nuclear explosives in the establishment of which it played no role. The AEC, that is, played no role in setting the priority of weapons relative to other nuclear activities or among types of weapons. The competition for resources among the latter took place with the relative priority of weapons already set by forces external to the Commission. The weapons program record of continuous prosperity is largely the story of the consequences of the ac-

²⁶ For a full discussion of all twenty-three programs, see Bupp, chapters 1-3.

Table 4. Arithmetic Mean of Prosperity Change Scores, FY 1958-FY 1972, 23 AEC Programs
(Presidential Budget)

Rank	Program	Mean	Rank	Program	Mean
1	High Energy Physics	9.0	13	Sherwood	0.57
2	Nuclear Safety	8.1	14	Rover	.43
3	Prog. Dir. and Admin.	7.1	15	Euratom	.08
4	Gen. Reactor Tech.	6.1	16	Training, Edu. and Information	-2.2
5	Biol. and Med.	5.4	17	Advanced Systems	-2.8
6	Cooperative Power	5.1	18	Spec. Nuc. Mats.	-3.5
7	Weapons	4.5	19	Pluto	-4.0
8	Naval Reactors	4.5	20	Army Reactors	-7.0
9	Civilian Power	4.3	21	Merchant Ship	-7.7
10	SNAP	4.1	22	Raw Materials	-13.6
11	Plowshare	3.5	23	Aircraft Nuclear Propulsion	-25.6
12	Isotopes	3.3			

tions taken in 1950. The program emerged from the "great thermonuclear debate" with a very real competitive advantage over other AEC programs. Weapons was a "stronger" program.²⁹

These measures of prosperity permit us to summarize AEC program activities since 1956. We could, of course, just subtract a given program's prosperity in FY 1958 from its score in the FY 1972 and rank the program according to the numerical value of the result. The "net prosperity change" is not, however, an especially helpful number. Now, we can recover exactly the same rank ordering by working instead with "prosperity change scores." For any program, the mean of the distribution of these change scores across all fifteen yearly intervals is also an indicator of how that program has prospered during the period for which we have data. The numerical value of these indicators, moreover, has an instantly appealing interpretation. A glance at Table 4 shows that since FY 1958 fifteen programs have prospered and eight have not.

What does all this have to tell us about how priorities are established within government? There is growing interest in examining federal budgets to determine how the nation is allocating its resources and exercising its spending priorities. The authors of one of the best and most recent of such studies correctly point out that in order to understand what the federal budget for any one year says about the national priorities, one must pay attention to past trends.

In determining priorities and formulating the federal budget, the President and his advisors do not start with a clean slate, deciding *de novo* how . . . the expenditures for fiscal 1972 should be allocated

in meeting national goals. Recent history, prior commitments, current political realities, relations with Congress, economic and social events beyond the control of budget makers—all play a major role in limiting their ability to change radically the current shape of the budget. What they consider desirable must be tempered by what they consider feasible. . . . The margin of truly free choice is surprisingly small.³⁰

Still, patterns of obligation and expenditure do change even at the aggregated federal level. Schultze and his colleagues, too, have found impressive variation in the objects of government expenditures over time. They proceed to infer changing priorities from changing absolute outlays.³¹ But we also know that programs are in explicit competition with each other as they move jointly through the budget formulation process. A measure of relative priority levels must take account of this competition.

The prosperity index developed in the preceding pages does so; it extracts from each individual budgetary observation a *meaning determined by its context*. The essential idea here is that the individual budgetary figures must be seen as the product of two quite different processes. One is the *budgetary process*, the public accounting that organizations give for the dollars that they receive. The stress here is on organization, the continuing complex hierarchy of government—bureaus, divisions, agencies, and departments. And the key to understanding administrative behavior in these terms is in the incremental nature of the process. The other is the *policy process*. Here emphasis is on the competition among programs for scarce resources which are needed to expand, or to continue, or even to begin. The central problem in

²⁹ For a more careful definition of "program strength," see Bupp, chapter 2.

analyzing political competition between programs is to make the information about each comparable. Dollars are the operational unit of administration. Political competition is something else again. The great difficulty in untangling these two aspects of the budgetary process is that they occur simultaneously.

The methodological problem this poses can be handled by a series of transformations which in general affect different observations in different numerical ways but whose result is a set of numbers which now may be compared freely among themselves. Inspection of these numbers confirms the fundamental proposition of this preliminary analysis: in the context of the "massively stable" processes cited by other scholars, there is considerable variation in the fortunes of federal activities *at the program level*. We believe that the explanation of this variance constitutes the real challenge for further empirical analysis of budgetary data.

Analyzing Federal Budgets

What has been the nature of the competition among programs? Has it been a "war of all against all" or are certain activities capable of causing other less strong programs to "pay" for their prosperity either by exercising first claim upon newly available resources or by actually growing at the expense of lower priority activities?

Professor Russett has suggested that we may be able to recover some evidence about the extent of such "benefits" or "payments" by examining the patterns of covariation among yearly changes in program levels.³² Since we now have strong *a priori* reason to believe the Atomic Energy Commission's weapons program to

have been independent of other Commission activities for the past twenty years, the inter-correlation of changes in weapons prosperity with those in the other twenty-two programs seems especially pertinent. They are reported in Table 5.

It is clear that everyone pays for defense. With the exception of the Commission's various military reactor enterprises (the largest group among those with insignificant correlations) all AEC programs change scores are negatively associated with changes in the weapons program. As anticipated, the relationship between prosperity changes in raw materials and weapons is high and negative. Decay in the prosperity of the former has been strongly associated with the growth of weapons. But the latter has evidently not only benefited from the decline of this program, it has also in Russett's sense been able to make other programs, notably general reactor technology and controlled thermonuclear research, "pay" for its prosperity.

The difficulty with such patterns of covariation is that, though fascinating, they may also be *wholly spurious*. Certainly they do not in themselves illuminate the real causal processes which produce variation in the prosperity of programs. At most, the *sign* of the associational measure, particularly when it is negative, may provide some clue about the right questions to be asked. Thus in the case of the AEC weapons program one could plausibly accept the overall pattern of inverse association as empirical confirmation of what we suspect on independent grounds. But positive correlations among prosperity change scores have no obvious causal interpretation and the meaning of differences in magnitude between any pair of negative coefficients is totally obscure. More important, the covariation patterns cannot tell us why some programs are stronger than others. Assuming the competitive struggle for limited funds is not exactly a war of all against all, what is it that

³² Bruce Russett, "Who Pays for Defense?" *American Political Science Review*, 63 (June, 1969), 412-426. See also, Bruce Russett, *What Price Vigilance: The Burdens of National Defense* (New Haven: Yale University Press, 1970), especially chapters 5 and 6.

makes some more equal than others? Is it strong directors who make for strong programs by "running a tight ship" and by "effectively generating support at the agency and congressional levels?"³³ Directors generating such support are able to neutralize opposition by the most potent natural enemy, the Office of Management and Budget. Programs which are supported at the Commission, the Office of Management and Budget, presidential and congressional levels are prosperous; programs which are not supported soon fall victim to the exigencies of the budgetary process.³⁴

This widely accepted professional wisdom, then, contains a clear theory of the governmental process. National priorities are not set by administrators with national constituencies; they are set at the operating levels of federal bureaus—by program directors sensitive to their own clienteles. National priorities are established by bureaucratic entrepreneurship in a process which settles priorities without anyone being aware of them. In this regard, Davis, Dempster, and Wildavsky's stochastic models perpetuate a fundamental error about the way government operates. The whole metaphor of an inert bureaucratic machine doing the same thing this year that it did last year misses the basic point. Priority setting in the federal bureaucracy resembles nineteenth century capitalism: Priorities are established by aggressive entrepreneurs at the operating levels of government. Programs prosper because energetic division directors successfully build political support to withstand continuous attacks upon a program's resource base by competing claims. As a consequence, the only matters which reach the president are those already in dispute. At the presidential level the administrative process is less one of "policy-making" than "dispute-settling." It is at this level that things are accepted simply because they have been accepted, that the desirable has to be adjusted to the feasible. On the whole, the differences which count, the actions which produce the patterns of relative prosperity and strength we

have discussed occur at lower levels of the administrative process.

All of this is missed by taking the Wildavsky and Lindblom perspective. By concentrating on the underlying regularities of the administrative process, these scholars are obliged to argue (in effect) that except for learning adjustments, no changes of any significance occur. We have seen that real change does occur within this "massive stability," reflecting real conflicts over purpose and priority. The more telling point about the process is that the program director, the operating-level bureaucrat, is a central figure in the determination of public policy. The history of the Atomic Energy Commission's weapons program is far more typical of the way public values are allocated than is the dramatic termination of the aircraft nuclear propulsion program.³⁵

This is a strong theory, and we must be careful to stress that our discussion is limited to the single agency on which we have data. But if this fact makes us somewhat cautious, we also feel that the concepts we have specified and the theory which underlies them are probably more—not less—applicable to other areas of government. The Atomic Energy Commission has been a fairly stable agency both in administrative organization and actual spending levels for the last ten years. That we find such great variation in the relative prosperity of programs here seems to suggest that we can expect greater fluctuations elsewhere, particularly in the controversial areas of social policy.³⁶ Do program directors occupy the same crucial position throughout the government? Is there more or less presidential leadership in other policy areas? For what programs is congressional intervention truly a significant factor?

These are the type of questions that need to be asked. By translating budgetary data into actual operating units of government programs, students of public administration should be able to provide more than speculative answers. Prosperity scores are themselves an important step in this direction, for they establish a measure of program prosperity and decay.

³³ These observations are based on a series of interviews with officials in AEC and the Office of Management and Budget.

³⁴ Russett's substantive conclusions have recently been challenged. See Jerry Hollenhorst and Gary Ault, "An Alternative Answer to: Who Pays for Defense," *American Political Science Review*, 65 (Sept., 1971), 760-764.

By respecifying Russett's regression model to include several dummy variables, Hollenhorst and Ault claim to detect important "sub-period effects." This more methodologically sophisticated approach, however, seems to us merely to compound the original theoretical error. The posited relationships are spurious.

³⁵ See, W. Henry Lambright, "Shooting Down the Nuclear Plane," Inter-University Case Program, ICP Case Series No. 104 (Indianapolis: Bobbs-Merrill, 1967).

³⁶ Congress appears to be much more active in the area of social policy. An excellent account of administrative policy in this area refers again and again to congressional intervention in specific programs. See Gilbert Y. Steiner, *The State of Welfare* (Washington, D.C.: The Brookings Institution, 1971). Or in a different area, Arthur Maass, *Muddy Waters: The Army Engineers and the Nation's Rivers* (Cambridge, Mass.: Harvard University Press, 1951).

COMMUNICATIONS

TO THE EDITOR:

In his recent article "Positivism, Historicism, and Political Inquiry," *APSR*, 66 (September, 1972), 796-817, Professor Eugene F. Miller discusses on pp. 812-14 my views on the relevance of existential phenomenology to the philosophical foundation of political inquiry and comes to the conclusion that "there is much to be learned from Jung's reexamination of the philosophical foundations of political inquiry, but he does not provide us with a genuine alternative to an historical relativism" (p. 814). Because of lack of space, I shall limit my present comments to a clarification of a few crucial points and postpone what I hope will be a fuller dialogue to another occasion.

Since I take Miller to be essentially a Straussian or belonging to the school of contemporary political thought whose spiritual guru is Leo Strauss, I ought to mention a critique of Strauss's "essentialism" I wrote several years ago.¹ Then I agreed with Strauss that positivism created a moral vacuum in contemporary political thought. Yet I asserted that "while, as Strauss agrees, positivism takes the naïve life-world for granted and, for this very reason, may be charged with negligence, his essentialism is guilty of self-contradiction" ("Leo Strauss's Conception of Political Philosophy: A Critique," p. 515). Strauss tends to reject all modern thought, the thought which does not conform to the classical standards as he interprets them: thus, for him, the history of modern thought is a history of nonphilosophy. His essentialism must be understood in terms of his ontological supposition that "to be" is "always to be," that is, there is *physis* which is unchanging, permanent, and universal. Without *physis* there can be no ethics, metaphysics, and epistemology. For Miller, too, without *physis* there is no valid ground for both "evaluation" and "explanation": to use the language of Stanley Rosen, who is critical of both Heidegger and Wittgenstein and whom Miller often cites with approval, there is only "nihilism." It must be pointed out, however, that Miller, unlike Strauss and Rosen, has not reduced positivism to a form of historicism, nor has he considered historicism as worse than positivism.

The word *historicism* has a controversial his-

tory in contemporary thought—from Karl Popper to Strauss, whose respective conceptions of it are diametrically opposed. Is existential phenomenology a form of historicism or historical relativism? Miller seems to think that it is. The belief that existential phenomenology is a historical relativism stems from a misunderstanding of the notion of the life-world (*Lebenswelt*). Inasmuch as the phenomenology of the life-world is a hermeneutics of social existence, so is Miller's epistemology a hermeneutics of *physis*. Take the example of Heidegger, whose philosophy I learned from the late John Wild (along with Edmund Husserl's and Maurice Merleau-Ponty's phenomenology, William James' radical empiricism, and John Macmurray's philosophy of action). For Heidegger, the "world" is the most inclusive horizon of meaning which is radically historical (or temporal). To acknowledge man's historicity (*Geschichtlichkeit*) is not to commit one to historicism (*Historismus*). To say that man is temporal is, for example, simply to affirm him as a finite being—man "dies," and only human beings can "die." Upon a close examination, Heidegger's thought does not reject *physis* as *logos* or *aletheia*. Whereas Miller, like Strauss, wishes to defend the notion of *physis* understood by post-Socratics, Heidegger goes back to the primeval notion of *physis* in pre-Socratics. Further, Miller seems to be suggesting that phenomenological thought is merely an extension of the *Lebensphilosophie* of Wilhelm Dilthey. It is well-known that in defending the notion of philosophy as a "rigorous science" (*strenge Wissenschaft*) Husserl was critical of Dilthey's historicism.

Then the real question is not simply an affirmation or a denial of "human nature" as such—the latter being called "historicism." Rather, Miller is interested in defending that version of human nature which is unchanging and universal without which, according to him, there is no possibility of knowledge or intelligibility. Even if there is a constant and universal human nature, the question of how conflicting theories about the permanent structure or content of human nature can be resolved remains to be answered. Miller's version of human nature is the one which is claimed to have a set of predetermined characteristics, whereas for the existentialist view, the essence of man is open and indeterminate. Temporally speaking, the former is a fidelity to the past, whereas the latter is an affirmation of the open future in the passage

¹"Leo Strauss's Conception of Political Philosophy: A Critique," *The Review of Politics*, 29 (October, 1967), 492-517. Miller's Straussian position is clearer in his "Political Philosophy and Human Nature," *The Personalist*, 53 (Summer, 1972), 209-21.

of time. "For human reality," Simone de Beauvoir writes in *The Coming of Age*, "existing means existing in time: in the present we look towards the future by means of plans that go beyond our past, in which our activities fall lifeless, frozen and loaded with passive demands" (p. 361).

Like Strauss, Miller holds that the world of common-sense understanding (or, as Strauss calls it, the "natural world" of man) is the presupposed foundation of the scientific or philosophical conceptualization of political things. However, essentialism, Miller's notwithstanding, reduces the world of lived experience (existence) to the world of pre-fixed essence (*physis*). It is tantamount to a claim for the primacy of *theoria* over *praxis*. According to Miller, "To know that a man is presupposes already some knowledge of what man is" (Miller, "Political Philosophy and Human Nature," p. 209): "existence" presupposes "essence." For him, therefore, without *physis* or in historicism "there is no possibility of obtaining knowledge that is objective, final, or absolute" (ibid., p. 218). In contrast to essentialism, in phenomenology the relevance of the life-world does not lie in its status as knowledge but instead lies in its status as the meaningful ground for human action, that is, as the original source of knowledge. So the geography of conceptual knowledge presupposes the natural landscape of preconceptual understanding. By exalting *theoria* at the expense of *praxis*, man himself is reduced to "a little abstract effigy" (Gabriel Marcel, *Being and Having*, p. 169). By "opticing" thought (Martin Buber, *Eclipse of God*, p. 40) or conceptual knowledge, essentialism loses the sight and importance of the life-world. It is then the quest for epistemological certainty or absoluteness that constitutes the central concern for Miller as "the distinguishing characteristic of human nature is man's desire and capacity to know" ("Political Philosophy and Human Nature," p. 219). The same temperament is shared, though strangely enough, by scientific objectivism whose slogans are, among others, conceptual rigor and predicative certainty.² By intending to elevate the intelligible, essentialism regards conceptual thinking as the activity of a disembodied and worldless mind. Whereas Husserl speaks of theoretical *praxis*, essentialism treats philosophy as if it is a lifeless activity.

² For a phenomenological critique of behaviorist epistemology and ontology, see the author's forthcoming article "A Critique of the Behavioral Persuasion in Politics: A Phenomenological View," in *Phenomenology and the Social Sciences*, ed. Maurice Natanson, 2 vols. (Evanston, Ill.: Northwestern University Press, 1973).

Human dignity, which both Miller and I cherish, is not served or preserved by postulating a pre-fixed human nature. On the contrary, it is elevated by affirming freedom, the denial of a pre-fixed human nature, in a world whose meaning is not fixed but must be constantly won. As John Wild said somewhere, freedom is not a natural but an existential norm. For a predetermined human nature (and a predetermined history, too, for that matter) is the death of human freedom and dignity or, as B. F. Skinner has it, the triumph of the reinforced man "beyond freedom and dignity," (or more appropriately, "against freedom and dignity"). The existentialist thesis that the meaning of existence is not fixed but is constantly won is not an acknowledgement of nihilism in which everything is permitted. According to Simone de Beauvoir, existential philosophy not only permits an elaboration of ethics but also is the only philosophy in which ethics has its place. It makes possible a genuine ethical theory precisely because it focuses on *how* man *acts* rather than *what* he is. This is the reason why I called the essentialism of Strauss "an ontological determinism." The structure of good and evil is not of God-given nature but is a human gift which has to be worked by *us all* in coexistence or transaction. As Martin Buber puts it, only where there is mutual sharing, is there reality or responsibility—including the reality or responsibility of thinking. Man ought to be distinguished from God, as time is from eternity. In conclusion: it may be said that the differences between Miller's views and mine stem from two fundamentally different styles of philosophy and ultimately views on life itself. Perhaps one is "priestly" and the other "jesterly." Be that as it may, if I were to call a stand-off between our styles of views and to refuse to acknowledge the superiority of mine over his, I would be a "historicist," and that would make my contention superfluous.

HWA YOL JUNG

Moravian College

TO THE EDITOR:

W. Phillips Shively's recent article "Party Identification, Party Choice, and Voting Stability: The Weimar Case," *APSR*, 66 (December, 1972), 1203-1225 is to be commended for its critical questioning of the utility of the American concept of party identification in the Weimar setting. The identification of *tendence* or sociopolitical bloc as an alternative does provide a better fit for the overall evolution of electoral patterns in many European systems.

Yet I cannot help but quarrel with Professor Shively's all too general conclusion that

"there is evidence that party identification in the sense of learned and enduring attachments to parties was not a factor in Weimar elections. Accordingly, the party identification theory of electoral stability apparently cannot help us explain Weimar voting" (p. 1220). This dichotomous present/absent approach to the question of lasting attachments to political parties cannot, in my opinion, be spread evenly across the board in the Weimar case without tending to distort our understanding of the phenomenal rise of the NSDAP as an electoral vehicle from 1928 to 1932. It is necessary to differentiate strongly, as scholars such as Lipset and Bracher do, between the qualitatively higher levels of voter stability, even through the worst depression years, of the SPD, KPD, and Zentrum, and the nearly complete electoral annihilation of all non-Catholic bourgeois parties (with partial exception of Hugenberg's anti-system Nationalists).

A more satisfactory approach might utilize party identification not as a dichotomous system-wide variable but rather as a party-specific variable within the *tendence* or bloc model. This, it seems to me, would more adequately take into account the organizational continuity of several parties and mass organizations, particularly the SPD and the Catholic parties, from the Kaiserreich to Weimar, as opposed to the hastily built Protestant bourgeois parties founded only after the Revolution of 1918.

The above revisions in the *tendence* approach might also be useful in comparing the development from Kaiserreich to Weimar to Bundesrepublik of party identification within each bloc. The mild recession of 1966-67 in West Germany and the accompanying quick rise (and equally quick decline) of the NPD, with many similarities to the NSDAP in ideology and voter appeal (see my *The National Democratic Party: Right Radicalism in the Federal Republic of Germany* [Berkeley: University of California Press, 1970]), indicates that this line of inquiry is still of substantive as well as theoretical concern in the area of German politics.

JOHN D. NAGLE

Syracuse University

TO THE EDITOR:

I believe that Professor Nagle has essentially restated here one of the arguments which I myself tried to make in my article. I distinguished there between party identification and loyalty to a socioeconomic bloc. Thus, I interpreted the collapse of the non-Catholic bourgeois parties as resulting from the fact that they represented

the same bloc as the Nazi Party, and that in the near-absence of party identification, there was nothing to prevent their voters from moving to the Nazis. By contrast, the KPD, SPD, and Zentrum represented different blocs, and bloc loyalty prevented their voters from moving to the Nazis.

Professor Nagle, as I read his letter, would prefer to treat bloc loyalty as a type of party identification. I do not think this would be fruitful since, as I suggest in my article, there are theoretically interesting differences between the two kinds of loyalty, both in the way they are acquired and in the way in which they manifest themselves in the electorate.

Two of Professor Nagle's suggestions are particularly useful:

(1) At some points in my article, for convenience in writing, I referred to the "absence" of party identification among the Weimar electorate. What my interpretation of Weimar voting suggests, however, and all that is necessarily supported by my findings, is that the level of party identification in Weimar was very low. A dichotomy between the "presence" and "absence" of party identification is unnecessary and untenable.

(2) Professor Nagle's emphasis on the organizational history of the parties is well-placed. This could help to explain, for example, why the inroads of the Nazi Party on other parties of its bloc were so much more complete than the inroads of the Communist Party on its rival, the Social Democratic Party.

W. PHILLIPS SHIVELY

University of Minnesota

TO THE EDITOR:

Read the Mendelson piece in the latest, December 1972, *APSR*, "From Warren To Burger," 1226-1233, and came across at least one grievous error/boo-boo. (So it seems to me because I have just finished a soon-to-be-published volume on Justice Black and Due Process, etc.) Mendelson, on page 1228, claims that "there was no dissent" in the important case of *Boddie v. Connecticut*. There was, indeed, a dissenting opinion, a very forceful dissenting opinion written by a Justice of the Court since 1937 who had, since his elevation to the Court, fought against judicial intervention and oversight functioning regarding the social and economic activities of state legislatures: Hugo Lafayette Black.

In the *Boddie* case, as in countless hundreds of opinions before, Black criticized the employment of the Frankfurter/Harlan et al. "fundamental fairness"/"shock the conscience" standard to evaluate the reasonableness and consti-

tutionality of state legislation. "Such a test," Black wrote in dissent, "willfully throws away the certainty and security that lies in a written Constitution, one that does not alter with a judge's health, belief, or his politics. I believe the only way to steer this country toward its great destiny is to follow what our constitution says, not what the judges think it should have said."

Knowing that Black would not like the thought of being associated with the subjective "shock the conscience"/"fundamental fairness" doctrine he so thoroughly criticized during his tenure as Associate Justice of the United States Supreme Court, I do hope you print this correction.

HOWARD BALL

Hofstra University

TO THE EDITOR:

I am very disturbed by the political bias that Professor Yang used in his review of my book, *The Politics of Formosan Nationalism*, APSR, 66 (June, 1972), 654-655. It might well have been written in Peking or Taipei because both regimes have blacklisted me for years and jailed hundreds of persons advocating self-determination for Taiwan.

My main objection is that he ignored the key purpose of the book, which was to present the views of native Taiwanese at home and abroad toward their postwar condition. My personal views were not the focus, as Professor Yang implies, nor do I feel today as I did three years ago when the book appeared. The changes in world politics since 1970 affect Taiwan especially, and have turned many who used to support the Taiwanese cause toward Peking or the KMT. Today the right of all 15 million on Taiwan to decide their future is paramount.

Professor Yang's criticism of my aim does not stand up, but I prefer to allow readers to judge for themselves the difficulty of studying native opinions in Taiwan, Rhodesia, Southwest Africa, or any Communist nation. The book explains fully why I could not use quantitative surveys as I have often done in Japan (the USIA told me it has never been able to ask sensitive political questions in Taiwan polls). To suggest that I should have surveyed overseas Chinese opinions ignores the fact that most are not Taiwanese but mainlanders descendants with little interest in or knowledge of Taiwan. I used all available secondary sources, including official Nationalist books and media, but never accepted official "facts" as automatically valid or relevant to the perception of the 13 million Taiwanese whose attitudes were my concern.

Finally, to claim that my book "performs a disservice to the betterment of Sino-American friendship" is to apply a standard which should never be used in academic reviews: I was not writing to please any government or further official policies. That would be the sole yardstick used by the two Chinese regimes in deciding whether or not to allow publication of a book. I am glad it is not used to censor American newspapers, magazines, or academic work.

DOUGLAS H. MENDEL, JR.

University of Wisconsin, Milwaukee

TO THE EDITOR:

I regret very much that Professor Mendel was "disturbed" by the "political bias" in my review of his book, *The Politics of Formosan Nationalism*. First, the "key purpose" of the book was recognized rather than "ignored," if one noted my remarks throughout the review. My major reservation was that the author passionately represented the views of an elite minority as being the voice of all 15 million people in Taiwan.

Professor Mendel wants his readers to believe that both the difficulty of scientific research inside Taiwan and the inadvisability of interviewing overseas Chinese would justify "those limitations" in the measurement devices of his behaviorist methodology. Consequently, his readers are expected to accept his conclusions that only the views of certain elite minority groups can be presented. Surprisingly, Professor Mendel mentioned nothing about the statistical lacunae and factual discrepancies I had cited, even though "all secondary sources available, and all KMT official data" were consulted. Besides, debunkers would not be impressed with the omission of a well-balanced bibliography.

Inasmuch as Professor Mendel stated in his book that he could fulfill his duty as a political scientist "to make his research available to the public as well as to governments and other scholars," one wonders whether Professor Mendel would still disclaim any credit should his advice have been adopted by the American Government in 1969 and after. Since that time, changes in world politics and the Nixon Administration's new China policy have not only crippled the movement of Formosan independence but also disconfirmed the predictions of *The Politics of Formosan Nationalism*. Obviously, the counsel of Professor Mendel's book did not serve the best interests of the governments concerned. Finally, Professor Mendel admitted in his letter that his own views were not the focus nor does he feel today as he did in 1969 when he read the final proofs before

publication, I am therefore puzzled why all his complaints became so imperative.

RICHARD HSIUH YANG

Washington University, St. Louis

TO THE EDITOR:

This is the first time that I have replied to a review of any of my books, and I hope it will be the last. Although he has penned an essay distinguished by his customary felicity of phrase and wit, Samuel Krislov also has indulged himself in various ad hominem speculations that detract from what (as I infer) he intended to be a generally favorable review of my *The Constitutional Polity*, *APSR*, 66 (September, 1972), 1043-44. Two points in particular demand correction: the first evidently may be comprehended as a slur on my present departmental colleagues, and the other as disparagement of my familial antecedents.

Krislov suggests that I attempted to discuss the possible impact upon the Supreme Court of radical ideology, because of the (evidently, undue) influence of my departmental colleagues at the University of Hawaii, rather than because of any serious interest I might have in the political ideology of Supreme Court justices. My Bacon Lectures were delivered in February, 1969, and they were published as the book which Krislov criticizes in 1970; I joined the faculty of the University of Hawaii in August 1971. The colleague influences to which I was exposed at the time I wrote the lectures were those of the Osgoode Hall Law Faculty of York University in Toronto, Canada.

Krislov states that "there are several class-origin digs by which Schubert seems to be asserting his own proletarian bona fides at the expense of middle-class colleagues." Hold that Tiger, Sam! What you evidently misunderstand is a remark in which I contrast our present phony affluence with the world of "our childhood, . . . a time when not just the urban ghettos and rural slums housed the relatively poor, but rather a time when almost everyone was absolutely poor for awhile." By "our" I intended to refer to Americans of my age group, and the statement was meant to be a description of social rather than personal history, as I thought and think the context (p. 133) makes abundantly clear. I have never previously thought it relevant to mention the matter, but my father was a graduate of Cornell, Phi Beta Kappa, Class of '14.

While I have the floor, I'd like to deal also with what Professor Krislov himself characterizes as his "greatest quibble," and in particular

with the first two of his three questions—the third would take us out of judicial behavior and into the very different subject of the professional role behavior of sociologists, and I am content to let that matter rest on the differences of opinion that Krislov and I evidently entertain. All three of these points are necessarily questions, because he introduces them with the caveat that his difficulty may—as it does—stem from his lack of familiarity with the relevant facts. So I hasten to supply these facts.

(1) He "find[s] it hard to imagine the empirical base on which th[e] conclusion is reached" that John Clarke was more liberal than Cardozo. It doesn't take very much imagination; I scaled the Taft and Hughes Courts, as my book details; and my data show that Clarke was considerably and consistently more liberal than Brandeis, while Cardozo was not significantly so.

(2) On the Steel Seizure decision, Krislov's sententious clincher ("All historical events occur when they do") rather begs the question *why* they occur when they do, and really, I insist, leaves open the only question of other than pedantic interest—which is a specification of the conditions under which it is possible for particular types of events to occur. I said that the Vinson Court would not have decided the Youngstown Case as and when it did if Harry Truman were not a lame duck; and I stand by that remark, drawing some comfort from the recollection that my position is supported not only by Corwin himself ("A Judicial Brick without Straw") but also by such an independent and nonbehavioral public lawman as John Roche—both Roche and I have articles, contemporary with the decision, in *Western Political Quarterly*, and only a couple of years later Roche published a more general theoretical statement in the *APSR* ("Judicial Self-Restraint," vol. 49, pp. 762-72) while I ventured a more general and historically-oriented empirical statement in Chapter 8 of my *The Presidency in the Courts*. It is true that Corwin, Roche, and I may all be wrong; but without Krislov's having first taken our arguments into consideration, I find it hard to accept as responsible criticism his own cavalier statement that "It is almost meaningless or simply wrong" for us all to have reached the considered judgments that, quite independently, we did reach about the Steel Seizure Case. Krislov may feel that this is an instance of "inadequate footnoting"; but he will discover, I trust, that in annotating lectures for publication (as distinguished from writing a textbook) one must assume that the professional literature of a generation ago

eventually passes into the public intellectual domain.

GLENDON SCHUBERT

University of Hawaii

TO THE EDITOR:

Since I regard Professor Schubert's description of my review as "not unfavorable" as a considerable understatement, I am both surprised and genuinely sorry that offense has been taken where none was intended. The cited two feeble attempts at playfulness arose out of a desire to satisfy puzzlement, but were in no event slurs at nor disparagements of anyone. On these personal matters, I am happy to accept Glendon Schubert's factual corrections. Although I could cavil at his rendering of his rather complex relationship with Hawaii, my point would have been the same had the sentence read "colleagues at Osgoode Hall" or indeed "in the profession." That—the serious point—is, I suppose, conceded in avoidance; the conceptual category of "radical justices" is not obviously applicable to anyone on or likely to be on the Supreme Court, and is therefore curiously contentless and not parallel to the other categories developed in the work.

As to the substantive matters Schubert deals with after rising to personal privilege, I find my original positions at least arguable. My "greatest quibble" was explicitly not with the specific comparison of the liberalism of Clarke and Cardozo, but with such trans-historical comparisons without explanation of how the conclusion was reached. I am not sure scalar distance from Brandeis, based upon cases in the 1910s and '20s in one instance, and the '30s in the other, warrants the conclusion discussed; I am positive such conclusionary statements should have been buttressed in the book by their evidentiary base, however strong or fragile.

As to the *Youngstown* issue, my comment was on the sentence actually printed, not what Professor Schubert tells us he meant, let alone his incorporation-by-reference of the authority of Roche and Corwin. That delphic sentence—some might find it sententious, even—reads:

Evidently, it could not have come at any other time than when it did, during the Vinson period and with an outgoing presidency at the nadir of its authority. (page 41)

This—the total discussion of the issues raised in his letter—not only fails to convey in any precise way what he meant, but also is destructive of the type of analytic thought he is arguing for in the book and the letter. By confounding sufficient and necessary conditions, it represents, in Hegelian garb, an unwarranted overgeneralization (Schubert now suggests only, at most, that the decision would not have occurred with a non-lame duck, and/or popular president).

In a book which pleads for and largely succeeds in developing systematic relationships, such assertions as the above two seemed out of place, whereas they might have been overlooked or accepted in a more routine work. It would, indeed, not be unreasonable for Professor Schubert to regard these criticisms as a compliment on the general level of effectiveness characterizing the volume.

To put matters in better perspective, let me add that these issues constitute a tiny portion of the book and considerably less than a major part of the review. The book is a fine and rewarding one, and the review, for the most part, deals with more important questions than are covered in these letters.

SAMUEL KRISLOV

University of Minnesota

EDITORIAL COMMENT

Volume Sixty-six. A while ago (June 1972, pp. 585-586) we published a short, snappy analysis of the contents of Volume 65 of the *Review*. Now we can do the same for Volume 66. In keeping with trends in the profession, we are pleased to be able to refer readers to Table 1, which gives 16 sets of figures for Volume 65, and includes lots of blank space for those who want to fill in comparable figures for Volume 66. Our comments will adhere only in part to the rather arbitrary format provided by the table, and in part we will wander off in other directions.

For example, we have noticed a bump in the number of articles devoted to Congress: six if you count articles on congressional apportionment, four otherwise. This is very suspicious; we all know that in a previous life the managing editor used to lurk around Capitol Hill. How ironic that none of the congressional articles are by associates, former associates, colleagues, former colleagues, students or former students of the managing editor. For some years now congressional scholars have been making the claim that theirs is a burgeoning field of study. Perhaps the word is beginning to reach the *Review*, even without the benefit of the managing editor's encouragement.

Nothing we have printed in the *APSR* in our time has earned us more favorable comment than the long symposium in Volume 66 on positivism and historicism. Why? We do not know. Is it an occupational disease of political scientists for us to be what David Braybrooke might call frustrated paraphilosophers? Is there something about the din of battle that pulls us out of the woodwork, rivets our attention, and sets the applause meter skyrocketing? Of course it is possible that no motives as base as these are involved, and that it is the substance of the issues debated in the symposium that really interested readers. In that case, it would appear that for many of us, there is something intriguing about cosmic hiccoughs emanating from far parts of our solar system, which may or may not make waves closer to home.

At any rate, the favorable response to this particular symposium gives us courage to persist in our occasional use of this device to stimulate thought and scholarship. The growth of this format reflects, we suppose, the managing editor's view that when we can get it, good conversation is better than a good monologue. Mounting symposiums is risky work, since it entails finding commentators who are not only appropriate but prompt, making certain that contributors get timely opportunities to see the

materials they are supposed to comment on, assembling all the parts of the package in the proper order, and getting it into print seasonably.

We think all this effort is worthwhile in several circumstances. Occasionally we accept an article that criticizes, continues, or amplifies the work of another scholar in such a way as to create a presumption of scholarly privilege. Once in a while we accept an article that divides our readers in a fashion that suggests they had better have it out in public. In these cases, we try to provide a forum for the direct exchange of ideas on controverted topics. We think that direct exchange leads to less misunderstanding in a scholarly community over the long run than is the case when scholarly discourse develops, as sometimes happens, into piecemeal guerrilla warfare.

A third occasion for a symposium comes about when articles arrive from disparate sources dealing with similar or closely related problems, or with a topic that seems especially timely or urgent or newly emergent or crucial from the standpoint either of the theory or the practice of politics. In this case the symposium format may underline a theme, or announce a new community of interest. We do not do this third type of symposium as much as we could, if we knew more, or knew better how to predict or to identify important new areas of study.

Another continuing feature of the *Review* which made its debut in Volume 66 is the review essay. We think this is an appropriate vehicle for the stimulation of thought about major figures in political science, for the presentation of a synoptic view of reasonably well-bounded fields of study, or for the extended analysis of a cluster of books. No doubt other rationalizations will occur as time goes on.

A stray thought tugs at our mind as we contemplate the uses of the review essay. As our discipline flourishes and proliferates, it is bound to be increasingly true that in any given issue of the *APSR*, fewer and fewer major articles will address all our readers. Specialized knowledge, to which we are willingly and unavoidably committed, means that any one reader will as time goes on find the front of the book harder to read, and less of it directly engaging to his interests—whatever they are.

This creates a special opportunity for features in the back of the book: reviews, review essays, correspondence, editorial comments. Here, surely, we should all feel comfortably at home. If the front of the *Review* is a series of boutiques, the back should resemble an old-

fashioned general store, where one shopper in search of a few yards of muslin can pause and exchange a word with another who wants a keg of nails.

Underlying this conception of the back of the *Review* is of course the notion that enough of us still have a need or at least a desire to cultivate our peripheral vision, that there are some things worth sharing that we can all share, that specialization, while important and probably indispensable for the increase of knowledge, is not all-important.

Having Fun? Colleagues occasionally ask the managing editor whether he enjoys the job. The fact is, like nearly everything else when seen from up close, there are joys and sorrows. Things to like about the job: The secretarial help. The chance to talk on the telephone. Advance looks at what interesting people are writing. The unmerited high status in the profession. Things not to like: Getting nasty letters. Having to say no. The high visibility in the profession that occasionally draws hostility.

The job description for the managing editor is somewhat deceptive. There are the daily chores that we all know about: answering the mail, assigning referees to manuscripts, reading evaluations, and deciding whether or not to publish. These activities can be worked without strain into even the busiest day provided good secretarial help is available and provided also

that they are done on a daily basis and are not permitted to pile up.

The imposition of a daily routine on the managing editor probably does levy a hidden toll insofar as it interrupts the longer cycles associated with the production of serious scholarship. But that is a risk that most managing editors knowingly face when they take on the job.

In addition to these daily tasks, however, are activities that are more time and energy consuming than many people realize. The managing editor is a constitutional officer of the Association. This makes him a voting member of the Council, and takes him to the three or more Council meetings that are held each year. As the person responsible for the source of the largest part of the Association's income—and for a major fraction of its expenditures as well—the managing editor ought no doubt to participate as a member of the Council. At a minimum this arrangement gives other Council members a chance to complain about the contents of the *Review*.

A certain number of queries and invitations also come into the office, we assume *ex officio*. Our judgment is that we ought to respond affirmatively to a decent percentage of these, so as to fulfill the main long-range duty of the managing editor, which is to try to stay abreast of what's happening in the discipline. In a discipline as variegated and amorphous as political science, this is not an easy task. No single political scientist, no matter how well acquainted, can afford to rely for long on the network of colleagues he has when he assumes the managing editorship. So part of our job is to attend to the continuous renovation and renewal of the managing editor's knowledge of the profession.

These long-range items are not part of the conventional job description for the managing editorship. Nevertheless, they constitute real obligations, they take time, and they are important sources of the drudgery and fascination of the job.

Man's Tools and Man's Choices: The Confrontation of Technology and Political Science*

VICTOR C. FERKISS

Georgetown University

Technology is such a pervasive element of contemporary human life that we usually are no more conscious of it than of the air we breathe. Technology is nothing new. From the time the first proto-man started using sharp rocks for weapons or tools, technology has reflected and shaped society's ideas and institutions. What is new is the dominant role of technology in modern society. If one accepts the definition of technology as "the institutionalization of utilitarian norms," centering on "the application of rational principles to the control and reordering of space, matter and human beings,"¹ one recognizes that the rise of technology is virtually synonymous with what is often termed development or modernization. Technology is the application of the principles of science—knowledge for its own sake—to human concerns. Because of the ubiquity of technology in modern society and its long history as a force in human life most social scientists have tended to take technology for granted, dealing with it as one of many variables which affect or are affected by human behavior, but not as

something which might be central to their concerns. Within political science, for instance, only students of international relations have paid much attention to technology as such, treating it as one of many determinants of military power; only since the advent of atomic weapons has it been suggested that particular technologies might actually be at the core of the power relationship, as when it is said that no nation can rationally use nuclear war to advance its political objectives since no nation can "win" such a war.

But despite the relatively little attention given technology by academic social science and, until recently, even by professional historians, the last decade has seen a burgeoning of interest in the social implications of contemporary technology on the part of the public and of the general intellectual community. Discussion about the impact of the machine on human life and values goes back to the nineteenth century, but recent scientific and technological advances have given new life to old concerns and fears. To older debates about the impact of industrialism on society have been added newer, usually fearful, queries about the effects of television, the computer, and new discoveries in the life sciences. Rising concern with environmental degradation has promoted widespread questioning of the values underlying contemporary industrial society, an extreme form of this questioning being exemplified by elements of the "counter culture" movement.

Perhaps the purest distillation of the mood of fear and disillusion infecting many in modern Western society is to be found in the work of Jacques Ellul, whose argument that in our era the norms of technological growth and efficiency must necessarily reign supreme, finds widespread (if far from universal) acceptance among intellectuals. Less pessimistic in tone but virtually as deterministic in its assumptions is the contention of such social scientists as Daniel Bell and Zbigniew Brzezinski that we are moving into a "postindustrial" or "technetronic" age in which technology has become the major force shaping social dynamics and institutions.

Such assertions about the pervasiveness of technology in human life as are made by Ellul, Bell, Brzezinski and the rest strike at the very

existence of political science as an autonomous discipline. Whatever formula one prefers to use to define its subject matter—power, decision making, or the authoritative allocation of values—political science necessarily assumes that human choice (essentially, conscious human choice) is at the heart of the historical process. It would be possible of course to conceive of and try to construct a science of politics which was deterministic in its premises, on the model of classical physics; indeed, such an enterprise is not without its adherents. But such a science would not only be more deterministic than contemporary political scientists would be willing to accept, it would be reductionist as well. Reductionist theories which make political behavior a function of some other kind of behavior or which deny the ability of men individually or at least collectively to decide on how the future will be shaped (within whatever physical or logical limitations may be postulated) make the study of politics a minor branch of something else. Worse yet, they strike at the human self-image as embodied in politics as such. The reduction of chemistry or pharmacology to physics might deflate the egos of practitioners of the former disciplines, but the chemical compounds themselves will not care. Making political institutions and behavior wholly dependent on technological factors not only destroys the autonomy of political scientists as scholars but of men as citizens.

Evident, though largely implicit, in the rapidly growing body of literature fueling the society-technology debate are three possible approaches to the relationship of technology to politics. The first of these is *technological determinism*, which awards to technology the status of a completely independent variable. This viewpoint is embodied in the belief that whatever man can do he will do. Politics and culture are relegated thereby to the role of purely dependent variables. In technological determinism not only is technology an uncaused, unwilled cause which causes other things, but technological change is the sole and irresistible cause of all changes in all other fields of human activity. Under technological determinism all the other sciences which deal with human life are reduced to describing particular classes of events, all wholly determined by technology.

A second approach is to treat *technology as a conditioning variable*, one among many factors exogenous in its origins to the political process having necessary, significant, and definable effects on political ideas, institutions, and actions, like those historical and social factors (geography, genetic inheritance, population

size, etc.) which are traditionally discussed in the first chapters of treatments of particular political systems in texts on comparative government. Technology as a conditioning variable, however, is often treated more deterministically than other such variables, because it is usually regarded as monolithic in its nature and social consequences and unidirectional in its development, impinging on all political systems in essentially the same way, if in differing degrees. Basic to this approach is the tacit assumption that, although its effects may be limited and may be mediated by other social forces, technology exists independently of any social decisions about its nature, and that its second-order consequences are universal and irresistible. The literature on political development or modernization especially exemplifies this acceptance of technology as a conditioning variable.

The third approach to the relationship between technology and politics postulates a *technology-politics interaction system* wherein technology and politics are mutually interacting variables, with technology, once existing, conditioning political life, while politics (human social decisions) condition the nature and extent of a society's technology. Studies of the history of science policy in modern nations, for instance, make it clear that Research and Development programs are not the products of a social stork but are the result of human decisions, and that, for financial reasons if for no other, not everything that can be done will be done, at least not at any given time or in any given context. By restoring technology to its place as a human creation rather than a *deus ex machina*, this approach forces us to focus on the public policy implications of scientific and technological possibilities.

The attitudes of any student of the technology-politics relationship can be classified as exemplifying one (or sometimes more than one) of these three approaches.

Technological Determinism

Curiously, one of the most extreme recent examples of an explicit willingness to swallow whole the position of technological determinism is to be found in a collection of essays by an author close to academic political science, William G. Carleton, Professor Emeritus of History and Political Science at the University of Florida. *Technology and Humanism* is something of a disappointment because few of the essays in the book (originally published in the *Antioch Review*, the *Yale Review*, and other journals) come to grips with any of the

basic issues concerning the role of technology in contemporary society.

One essay which does deal directly with the power of technology, however, is "The Century of Technocracy," first published in 1965, which begins with the sweeping statement: "The overriding contribution of the twentieth century to history is technocracy: the technicalized, cybernetic, computerized society increasingly run by scientists, engineers and technicians. This society is drastically changing man's institutions and transforming his behavior and basic values" (p. 255). Taken at face value, what Carleton is saying here is that political science as he and we have known it is obsolete and must be wholly restructured around the technological variable. But, once having said this, he goes on almost as if nothing has happened. Scientists, he asserts, are becoming dominant everywhere; ideology is in decline and will be replaced as a savior in people's minds by machine technology. But Carleton fudges on the issue of determinism. Apparently, though we cannot control technological growth and change, we can tame it. This seems to be the implication of his exhortations not to let the machines control us but to control the machines ourselves for humanistic ends by means of the democratic process. While it might be unfair to accuse Carleton of Pollyannaism, the mildness of the bulk of his remarks, both substantively and rhetorically, contrasts strangely with the shocking implications of his general statements about the nature of the contemporary political scene.

Though William Kuhns, Professor of Communications at Loyola University in New Orleans, adopts the stance of detached expositor, his book, *The Post-Industrial Prophets: Interpretations of Technology* is a valuable introduction to the ideas of the advocates of technological determinism. His subjects include Lewis Mumford, Siegfried Giedion, Jacques Ellul, Harold Adams Innis, Marshall McLuhan, Norbert Wiener, and Buckminster Fuller. Mumford is not, of course, a determinist, and his polemic against the consequences of contemporary technology seems sometimes to be based on an excessive optimism about man's ability to control his technology. Neither is Giedion, whose primary interest is in documenting technology's effects. Nor is Wiener, whose concern about the use man makes of the computer implies the existence of options. But the figures to whom Kuhns devotes most of his balanced, lucid, and thoughtful book are determinists, and Kuhns's own humanistic concern with human freedom illuminates the implications as well as the origins of their views.

Kuhns's division of the writers he discusses into schools of thought reflects his particular preoccupations as one of McLuhan's former associates. He argues that writers with a nineteenth-century bent, such as Mumford, Giedion and, essentially, Ellul, identify technology with the "work-performing, energy-transforming machine," while we are now learning "to identify technology with media and other forms of information control" (p. 8). This is a useful distinction, and insofar as it is a valid one it increases the problem of maintaining the autonomy of political science as a discipline. So-called "cybernetic" or communications models of politics are already claiming to give us superior insights into the political process. To the extent that they provide us with comprehensive descriptions of political action, and to the extent that communications patterns are technologically conditioned or determined, to that extent politics itself becomes technologically conditioned or determined. But while Kuhns is not concerned with politics as a discipline, he is concerned with the autonomy of man as a being; and he is optimistic. "While the mechanized conception of technology led almost inevitably to a polarization of man and machine, the media or information-control interpretation leads to a conception of organic continuity between man and his technologies" (p. 9). Put another way, if the old technology presented the specter of man's becoming dependent or subordinate to things, the new technology liberates him by making it possible for him to further extend his intellectual and spiritual range.

Yet whatever the normative implications of their work, the communications theorists to whom Kuhns feels closest do make politics a dependent variable of communications. Harold Innis, a distinguished Canadian economist who, unlike his disciple McLuhan, deals with historical change in an orderly fashion, has focused on the rise and fall of power structures. He argues that the media in use in any society (writing, printing, oral communications, etc.) are the independent variables and that when a new medium infiltrates an existing political system it then slowly subverts it. Since Innis's theory is essentially a kind of cybernetic determinism, it forces him to regard such things as censorship and information monopolies as the true sources of political power. McLuhan's divergence from Innis actually results from his extension of Innis's ideas. Less concerned with social structure than his master, he treats the media as not simply affecting the form of a society through changing the society's "temporal or spatial biases," but as having a direct influence on the

human sensorium. "The medium is the message," his now famous catch-phrase, asserts that how one is communicated with crucially affects one's perception of the world—and one's personality itself—and does it directly, without the mediations of any other social force.

Buckminster Fuller is a prophet of technological determinism whose position is perhaps even more radical than that of the communications theorists, since for him even communication—to say nothing of politics—is simply an epiphenomenon of energy. For Fuller, the proper level of social analysis is the energy-man-object ecology of the planet as a whole. He is a systems-oriented thinker who has a utopian belief in the fundamental harmony of the world which is obscured and distorted by politics; this harmony, however, could be institutionalized, he believes, in a new organization of the whole based on economics in which energy and mobility patterns would be the fundamental variables and which would utilize the computer as a tool for systems analysis and control. Political scientists would do well to read Fuller; he has a great appeal to certain of the young who are dissatisfied with the present but cannot accept the negativism of Mumford or the pessimism of Ellul and find the essentially optimistic McLuhan limited in range. The new scientific utopianism which embraces thinkers as diverse as Fuller and B. F. Skinner may present a more potent challenge to political science than does traditional utopianism because it claims to be based on the data of the "hard" sciences which so many contemporary political scientists have chosen to revere.

Actually even Innis and McLuhan have a utopian streak, and Kuhns shares their normative bias. They divide cultures into spatial and temporal ones, the former based on writing and the latter on speech or (in McLuhan's paradoxical and debatable formulation) on visual media such as television. For this school of thought, oral tradition and sensibility "are interpersonal rather than impersonal." They tend toward "immediate and local forms of authority over distant, centralized forms," encourage "dialogue rather than a monopoly of opinion" and make learning "an involving and creating activity rather than a simple experience of information transmission" (p. 167). Whether the belief in the salvation of democracy through modern communications technology is valid (and Kuhns has his reservations) is a substantive question which is secondary to the assumptions which underlie it. Whether one answers yes or no, to ask the question is to assume a

radical dependency of politics upon the media which is by no means self-evident. Also, Kuhns and his friends never really ask to what extent human political choice can determine the nature or the content of the media of a society, apparently assuming either that political decisions cannot influence them or at least that they do not do so.

Technology as a Conditioning Variable

Many of those who write about society and technology—perhaps most of them—are ambivalent about whether technology wholly determines our lives or merely affects them, and, if the latter, how much these effects can be controlled by human volition. This is to be expected. Unless one denies that changes in technology can really change anything, and insists that it is all simply a matter of old wine and new bottles, obviously technology is important. Yet to consider it all-important is to make it our master, and few will admit to being slaves if there is any basis on which they can deny it. This ambivalence—and sometimes downright confusion—is reflected in both the analytical and the descriptive treatments, although it is perhaps more pervasive in the latter, where it is easier to avoid a clear-cut resolution of the issue.

Herbert Muller, Distinguished Professor of English and Government at Indiana University, is almost explicit about his ambivalence in *The Children of Frankenstein: A Primer on Modern Technology and Human Values*. Muller takes the position that technology is just another factor in our lives, an important one but not so important as to change the basic rules of the social game: men are still men. But at the same time he asserts that technology has outmoded our eighteenth-century constitution, designed for the governance of an agricultural society, and he accepts the thesis that we live in a postindustrial society. In contrast to Carleton, he claims that we are in no danger of domination by a scientific elite. Technology can be used for good or evil; it is up to us. Yet he is uncertain about whether our system can be inventive enough to deal with the social problems posed by technology. Muller's work is rambling, bland, and often irritatingly avuncular in tone, but it is also balanced and remarkably comprehensive. Though the author embraces aspects of all three approaches to the man-technology issue, basically he seems to regard technology as a conditioning variable. Despite its title this is a book that even the most timorous can read immediately before retiring, possibly even with soporific effect.

Smaller in size but more intellectually ambitious is *Technological Change: Its Impact on Man and Society* by Emmanuel Mesthene, late director of the now defunct Harvard University Program on Technology and Society. Unfortunately, Mesthene tries so hard to be judicious as well as comprehensive that he leaves us confused about the extent to which technology is to be regarded as an autonomous force in society. But, as his title indicates, his main thrust is to accept technology as a given and to concern himself primarily with its consequences. Though he explicitly states that "technology is not independent of the society in which it develops and flourishes" (pp. 20), and that it is not "a somehow autonomous force that develops according to its own internal laws and lets the consequences fall where they may" (p. 20), the "sounder" view with which he associates himself is that social institutions play a role in "fostering" technological development and "mediating between technology and its effects" (p. 20). This is obviously quite different from arguing that we can control, shape, or reject technology in such a fashion as to avoid these effects.

Mesthene is deeply concerned with values, yet here too his ambivalence about the autonomy of technology is manifest. He argues that while "technology creates new possibilities [it] leaves their disposition uncertain" (p. 60). Thus technology is value neutral; the tools are given us, we can do good or evil with them—a knife can cut meat, excise a gangrenous limb, or murder a fellow human (whether such tools as H-bombs are good for anything is an issue Mesthene does not discuss). Yet he admits that not only do technologies have necessary consequences, about which differing value judgments can be made, but that changes in technologies can effect changes in the values of a society, which comes close to saying that technology is not value-neutral but self-validating. This implication in turn is only one step away from the view of Herbert Marcuse and his followers that in modern society technology has itself become an ideology in the strict sense of the word.

When he discusses the impact of technology on political life as such, Mesthene in effect treats it as a conditioning variable, the effects of which he approves. Technological advance, for instance, leads to "the enhancement of the public sphere" (p. 63) as a result of centralization and the enlargement of the effective social unit (both geographically and socially). Mesthene believes that technology can create the conditions for more direct democracy by making information more accessible to the public. We

can dismiss the bogeyman of Ellul and others who see technology as necessarily submerging the individual, he holds, since technology, all things considered, will lead to something not unlike McLuhan's global village, save that for Mesthene, a former teacher of Greek philosophy, the ideal of the life lived in public is Periclean Athens. Although Mesthene has some reservations about direct democracy in terms of the ability of the general public to make operational decisions, he, unlike Kuhns, is not concerned about what might be the fate of the individual in such an environment. But, then, individualism never was a value for classical Greek philosophy.

Less deterministic, either explicitly or implicitly, are recent works by two authors who deal with radically different aspects of the impact of technology on society. William Braden, a knowledgeable, sophisticated Chicago newspaperman, is concerned about the impact of technology on the values of youth in *The Age of Aquarius: Technology and the Cultural Revolution*; while Eugene S. Schwartz, identified by his publisher as a "former senior scientist specializing in information sciences at the Illinois Institute of Technology Research Institute" in his book *Overskill: The Decline of Technology in Modern Civilization* discusses the physical impact of technology upon the human race. Both Braden and Schwartz could be classified among those treating technology as a conditioning variable in politics, but, because Schwartz deals in polemic and advocacy (though his work is heavily documented), while Braden is essentially a reporter and synthesizer, it is easier to know where Schwartz stands than where Braden does.

The question Braden asks in *The Age of Aquarius* is why what he assumes to be large segments of educated young people are in revolt against modern American society; (the book was written at the height of the perhaps short-lived "youth culture"). He therefore focuses on the issue of what relative weight should be assigned to problems of personal psychological adjustment as against objective social conditions in triggering youthful dissatisfactions. His extensive reading and his lengthy interviews with such persons as Bruno Bettelheim, Edward Hall, Richard Flacks, and Christopher Lasch seem to have convinced him that contemporary America is in the midst of a cultural crisis, stemming from a humanistic revolt against technology and its results. Paradoxically, technology is not only the enemy; it is also the precondition of the revolt; since, as Braden points out, adolescence as a distinctive

sociopsychological status is the product of an affluence dependent on a high-technology economy.

It is often difficult to disentangle Braden's own views from those of the writers and interviewees he quotes or refers to (without, alas, citation). His own judgment about the extent to which man can resist or control technology is unclear. He comes close to embracing the Muller-Mesthene position that technology is something which is here and which has both good and evil consequences and that what needs to be done is to accept the former and reject the latter—a formula as unexceptionable as it is difficult to operationalize. But despite its lack of intellectual focus, *The Age of Aquarius* is a rich and rewarding meal for anyone interested in the interrelationship of culture, society, and technology. Time alone will tell whether the title of the book is a misnomer, whether it should not instead have been *The Year of Aquarius*.

For Schwartz, technology is not evil per se, though some technologies may be. The real problem is that if technology is permitted to grow at its present exponential rate, humanity is physically doomed. We can and we must work, he says, toward the creation of a less efficient society. Growing skepticism about the ability of technology to sustain ever larger populations, especially without insupportable side effects, is becoming increasingly common among social scientists as they begin to assimilate the ideas of the ecologists and population specialists. Increasing attention is being paid to the gloomy extrapolations of Jay Forrester and his Systems Dynamics Group at M.I.T. But Schwartz goes them one better in pessimism. Forrester and his colleagues believe that within technology itself lies the source of our salvation and that we can rely on the computer to do the multivariate analyses and produce the systems designs necessary for the kind of planning we will need if we are to avoid catastrophe. Schwartz denies that technology can save us from the dangers technology creates. Chicken Little is right; or, as Schwartz puts it, "the residue of unsolved problems arising from a multiplicity of quasi-solutions converges to a point where no techno-social solution is possible" (p. 76).

But even though Schwartz assigns to technology an overwhelming and, in effect, monocausal role in the doom of the world he is not a determinist, because he believes that somehow, even at this late date, man can save himself by an act of will. Population must be stabilized and resource utilization must be drastically cut

back; our standard of living must be greatly reduced and men must become more self-sufficient than the "dependent urban dweller of today" (p. 297). Essentially, then, Schwartz believes in the primacy of politics over technology, though what form such a politics—such an act of anti-technological choice—would take, he does not even begin to tell us. While *Overskill* is a tract, it is a sophisticated one, and its very extremism makes it especially valuable heuristically to any social scientist who might be inclined to take the present physical context of the political system for granted.

Technological-Political Interaction

Of all the recent literature which deals with the interdependence of technology and politics and assumes that man is capable of choice even in dealing with his artifacts, none is more valuable, especially to the newcomer to the field, than Nigel Calder's *Technopolis: Social Control of the Uses of Science*. Calder, a distinguished and prolific British science editor, has written a book which is badly organized both as to data and ideas but is rich in information and insights, and the bibliography though short is excellent. Calder sees both modern technology in general and the second-order effects of particular technologies as radically transforming political ideas and institutions; he also recognizes, however, that our technologies are the result of human choices, especially choices about allocation of the scarce resources upon which technological development depends. Like other perceptive students of technology he sees communications as the most important current interface between technology and politics. Calder argues that a complete two-way information system (he calls such a device the "World Box") could lead either to centralization or to decentralization depending on human decision, and that it could play a vital role in what he regards as the clearly soluble problem of controlling the expert. He speculates that bureaucracy could be abolished, since, once the possession of information becomes more general throughout the society, special expertise (which in his opinion is the fruit not of skill but of secrecy) will become devalued and the functionally necessary roles of control and coordination will be performed by "in and outers" dividing their time between government and the universities or professions, acting always under a keen and watchful public eye.

Though on the technical feasibility of computer planning of world systems Calder is closer to Forrester than to Schwartz, he also recognizes that any increased ability to analyze

and control future world systems will not do away with the need for political decisions about what questions are to be fed into the computer and about what weights should be assigned to particular values. In accordance with his belief that the science-technology issue will dominate the politics of the future, Calder attempts to categorize public opinion in terms of beliefs and attitudes about science and technology. Those who are inclined to let science and technology dominate society he calls the Zealots; those who are more skeptical about the benefits of such an arrangement are the Mugs, a suggestive if hardly definitive typology. Unfortunately he offers no data to indicate how the public lines up at present in terms of his categories. He himself, however, makes no secret of his hope and conviction that the Mugs will win.

The most clearcut recognition of the technology-politics relationship as one of mutual causation is usually to be found in case studies of particular problems, where the complex intertwining of cause and effect, necessities and alternatives becomes evident from a consideration of the empirical data and the political and social history of a particular problem. Two recent studies which focus on information technology are good illustrations. One is *Information Technology in a Democracy*, edited by Alan F. Westin, Professor of Public Law and Government at Columbia, and published under the auspices of the program which had been run by Mesthene at Harvard. The other is *Computers, Communications and the Public Interest*, the report of a series of symposia held under the aegis of Johns Hopkins University and the Brookings Institution and edited by Martin Greenberger, Professor of Computer Sciences at Johns Hopkins. Both deal with a number of subtopics but cannot avoid tackling three substantive questions which point up some of the complex interactions between political choice and technologically conditioned human powers.

The first of these is the problem of civil liberties created by the ability of new forms of machine technology to maintain virtually absolute surveillance over the individual, a capacity which will be enhanced if and when (possibly quite soon) personal checks are abolished and we move to an economy based wholly on the credit card. The second is the problem of political control presented by total information systems similar to Calder's "World Box" which would make it possible for citizens to maintain surveillance of their government and would restore direct democracy though push-button electronic voting devices permitting expression of opinion on the issues of the day; alterna-

tively, of course, such a system could lead to the totalitarian world envisioned in 1984. Finally, there is the question of how societal values can be implemented more efficiently by combining total information technology with systems analysis. Could such a combination enable the world to deal effectively with the vastly complex problems of an increasingly interdependent technologically based society—problems such as urban decay, undesired international conflict, pollution and starvation, whose causes, consequences and remedies perhaps only the computer can fully analyze?

As might be expected, different contributors are interested in different aspects of these questions, and the focus ranges from the global to the minute. No consensus emerges from these two volumes. Their value lies in sharpening the reader's wits and increasing his knowledge. Perhaps the most provocative single paper in either volume is that of Anthony Oettinger in the Westin collection, which discusses the importance of the difference between "after the fact" and "real time" information processing and how this affects our ability to control organizations and societies. Socioeconomic planning designed to deal with the problems created by planetary interdependence would require a tremendous amount of information of a kind which is difficult to collect and process on a real-time basis, and the efficiency of any control functions built into such a system would be seriously impaired by such a lag. Oettinger's description of the difficulty of getting necessary information in time to the right people within corporate structures should give pause to those who envision running the world by computer. Even if we could program all our values into such a control system (and this, of course, is primarily a political rather than a technical problem—if Disraeli were alive today he would surely aspire not to write a nation's songs but to program its computers), we would still confront the problem of getting the necessary feedback from the real world into the information machine in time to make useful decisions.

What tentative conclusions about the role of the study of technology in political science and the fate of the study of politics itself can we draw from the works under discussion? The fact that the nearer we get to the mundane details of real life, the greater the apparent role of the political variable suggests that there is something inherently wrong with the concept of technological determinism. The widespread acceptance of the irresistibility and autonomy of technology is itself a force which threatens the autonomy of politics both as a field of study

and as social reality; and since what is taken for granted cannot be effectively refuted, a major task of political science would seem to be the analysis of the reasons for the domination of this idea—or, more properly, this ideology—and its refutation. At the same time, much more needs to be done to create a body of empirical studies of the interface between technology and politics for two reasons: (1) to expand our understanding of the limits of political choice in relation to technological possibilities; and (2) to provide the raw material for a synthetic literature on which to base the study of technology as a crucial variable affecting modern politics.

Because man is a symbolizing animal and sees reality not directly but through structured

perceptions, the study of communications must play an especially important role in any such enterprise. But to make communications the essence of politics would be a mistake. There is reality as well as perception, and cybernetic reductionism is as simplistic and non-productive in the long run as any other kind of reductionism.

Finally, the need to pay more attention generally to technological variables in politics should, by forcing upon us a clearer understanding of the relationship between man's tools and man's symbols, between man's creations and his choices, lead to a clearer understanding of man himself as a social being, which, after all, is the real subject matter of political science.

BOOK REVIEWS

Bach, Beethoven, and Bureaucracy: The Case of the Philadelphia Orchestra. By Edward Arian. (University, Alabama: University of Alabama Press, 1971. Pp. x, 158. \$7.50.)

Edward Arian's *Bach, Beethoven, and Bureaucracy* is a remarkably important work in the best, (and most radical,) tradition of the policy sciences. Arian studies the Philadelphia Orchestra from 1912 to the present from a unique perspective. For twenty years he was a member of the orchestra's string section and active in the musician's union. He has since become a Ph.D. in political science. The core of the book is Arian's argument that the Philadelphia Orchestra has become a large, impersonal, bureaucratized institution which maximizes values other than the pursuit of music for music's own sake.

Arian contends that economic, rational, bureaucratic management of a symphony orchestra has massive artistic, social, and cultural costs, and that these costs overwhelm the benefits of businesslike management. In order to survive, management must rely heavily on private charity, recording royalties, and box office sales. The major cost of relying on private charity to fund the orchestra is that fund raisers and large donors must control the orchestra's Board of Directors. Of the 128 people who served as directors from 1901 to 1969, 84 were listed in the Social Register, and they were predominantly big businessmen, bankers or attorneys. There are no professional musicians on the Board. The Board chooses the music director of the orchestra and essentially controls performing conditions and repertory. Consequently, financial and status concerns overwhelm musical concerns.

Recording royalties are the second major source of financing, accounting for at least 14 per cent of the orchestra's earned income. Marketing considerations, not musical ones, determine what gets recorded. Further, recording repertory determines performing repertory. Choice of repertory becomes a form of free advertising. Rehearsing a work for performance minimizes the time that it takes to record it later in the same week and reduces labor costs. Arian computes that in the 1960-61 and 1961-62 seasons, 44 per cent of the works performed served as an economic aid to recording. He comments, "Since the public buys what it is most familiar with and likes best, there is a strong inclination to cater to mass demand by programming and recording those compositions

with the greatest popular appeal. Conservative audience tastes are at once created, sustained, and catered to, and a circle of conservatism is completed and continues to feed upon itself" (p. 23).

Dependence on the box office has similar effects. Innovative repertory, new music, or any other variation from the standard chestnuts mean empty seats, and the orchestra cannot afford to perform for free in schools, hospitals, poor communities, prisons, or anywhere else.

Arian's second line of argument is more provocative. He contends that the bureaucratization and routinization of art results in alienation from work among people who have chosen a career for its psychological gratifications.

Musicians, although trained to be soloists, are employed as anonymous members of ensembles, with no control over what music they play or over how it is to be interpreted. When it is played well, the rewards go to the conductor or soloist. No one notices the third man in the second violin section. This results not only in boredom and frustration with work, but with hostility toward the conductor, the first chair players, the management of the orchestra, and even the audience. Arian reports that, among orchestral musicians, cardiovascular and gastrointestinal disorders are unusually high. He does not discuss the rumored alcoholism and drug usage among performers, but he does make it clear that a lot of what we take to be unprofessional behavior is frequently a manifestation of alienation from work.

Let me suggest that these conditions are not limited to orchestras. Academicians are severely underrepresented on universities' Boards of Trustees. Organizational and financial considerations determine our course offerings and staffing decisions. Each of us is trained to become President of the APSA and to supervise dissertations, but we end up teaching mass lectures of introductory courses. Anyone who has sat through a faculty meeting or a departmental meeting knows the acrimony and bitterness toward the organization that follows from real or perceived powerlessness and lack of self-fulfillment. Analogous situations develop in hospitals, clinics, and law firms. Arian has studied an orchestra, but the demands of bureaucratic organization and economic pressures seem to have the same impact on artists and professionals that assembly lines have on factory workers. Were these findings generalized to the whole system, we would be forced to reconsider the

entire structure of work life. If the people with the most psychologically rewarding and prestigious jobs are alienated from their work and manifest the normal consequences of such alienation, then the system is in jeopardy.

Arian thinks that federal funding will be the source of ways out of this dilemma. He argues that federal funding of the arts could not have a more conservative impact on the arts than their current dependence on private charity and that private censorship has been greater than governmental censorship. Ultimately, Arian argues, that the solution lies in the complete restructuring of the symphony orchestra. The orchestra must exist to serve music. This means expanding the audience, encouraging the composition and performance of new music, enabling individual musicians to play as soloists and in small ensembles, and so on. All of this can be done, he argues, only with federal funding and with the development of a new breed of arts administrator who cares about the arts, as opposed to being a super salesman.

I wonder if the solution will be so simple. Perhaps the mere perpetuation of large scale organizations, such as the Philadelphia Orchestra, inevitably generates alienation and powerlessness among its members, and conservative policies. I would suggest that in addition to providing federal funding for these organizations, there ought to be artists' subsidies, a form of guaranteed annual income for creative and performing artists. This would free the artist from any form of organizational pressure and would permit the uninhibited pursuit of art. Perhaps this will be followed by scholars' subsidies.

KENNETH SHERRILL

Hunter College, City University of New York

Thomas Jefferson as Social Scientist. By C. Randolph Benson. (Cranberry, N.J.: Fairleigh Dickinson University Press, 1971. 333 pp. \$10.00.)

Thomas Jefferson: A Well-Tempered Mind. By Carl Binger. (New York: W. W. Norton & Co., 1970. Pp. 209. \$6.95.)

Liberty and science are the two fundamental principles of liberalism, in themselves separate and diverse, which liberalism must make inseparable. On the one hand, liberation of the body's appetites from natural fears and social conventions is dignified by the accompanying, progressive emancipation of the mind from tradition and falsehood; on the other, this liberation of the mind is justified and supported by the benefits it brings to the many who participate in it only imperfectly or indirectly, by liv-

ing in an Enlightened Age. When liberty and science appear to diverge, therefore, especially when social science (the crux of the two principles) seems incapable of aiding liberty, or indifferent or even hostile to it, the liberal senses a crisis of liberalism, not merely a passing difficulty. In recent years the American liberal has had to live through the troubles of the Democratic party and of the university, his ancestral residence and his vacation home, and the experience has given him a psychosomatic pain. He has had to defend both while losing confidence in both. What task could be more useful and urgent to him and to others depending on him than to reconsider the thought of Thomas Jefferson, who held that liberty and science must progress together, who argued the special significance of America as an experiment for mankind in the possibility of such progress, and who, to carry on this American experiment, founded both the Democratic party and the liberal university?

Professor C. Randolph Benson's book presents Jefferson as a social scientist in the comprehensive view we require. He sees in Jefferson the spirit of Comte, whose comprehensive, "positive" science was to replace the reactionary votaries of religion and their destructive critics as well. But as Benson recognizes, Jefferson would have found Comte's authoritarian politics abhorrent. Today it would be inadequate but not misleading to read "B. F. Skinner" in place of "Comte"; and the retreat from liberalism sounded recently by that eminent social scientist illustrates our compelling need to assess both principles of liberalism together. How, then, were liberty and science joined together in Jefferson's thought, and what has happened to disjoin them?

These are not Benson's questions, to be sure; Benson wants to consider Jefferson as a precursor of modern social science. But his intention leads him toward the predicament in which we find ourselves. Part I of his book is on Jefferson's background, and makes clear that Jefferson looked on that background not as a formative influence but as an opportunity to make a new beginning, the experiment of men "trusted to govern themselves without a master." Part II, the bulk of the book, explains Jefferson's thought on "social structures and functions" in nine chapters divided conveniently if not systematically. Part III puts together "Jefferson as both social scientist and reformer."

To explain why Jefferson is but a "precursor" of modern social science, Benson allows that his social science was pre-Darwinian, and thus based on Newtonian and Locke-

an natural law, whereas ours is post-Darwinian, and not based on an unchangeable nature of man. But this difference goes deeper than Benson concedes, for Jefferson's pre-Darwinian natural law appears to be the basis not only for his social science but also for his understanding of liberty. Jefferson could not have put his trust in the rights of man to secure liberty if *man* were mutable and if the human were not definitely separable from the subhuman. He could not have denied the justice of slavery if he had not found in his scientific researches that the Negro was not inferior to whites in moral sense. He also declared his "suspicion" that the Negro is intellectually inferior to the white, but this inferiority was not the critical one to him. Benson calls Jefferson's suspicion on this point "ethnocentric" (p. 226), and no doubt it is; yet now that social science has abandoned the moral sense as defining man, it cannot match Jefferson's honest candor in studying the intellectual endowments of different races or groups of men.

Thus we observe that Jefferson's pre-Darwinian thinking produces a difference with today's social science on what he called "natural aristocracy" and it calls "elitism." Jefferson is quite sure that a natural aristocracy of talents exists that must be distinguished from, and made ascendant over, the pseudo-aristocracy of the wealthy and the well born. But post-Darwinian social science is obliged to doubt the existence of a natural aristocracy; so it must either deny the need for aristocracy (because all men are by nature equal?) or acquiesce in the rule of a pseudo-aristocracy. Post-Darwinian social science could never assert that the purpose of secondary education is to rake the geniuses from the rubbish. Nor could it admit that with mass education "the briar and the bramble can never become the vine and the olive." Jefferson went on to say that "their asperities may be softened by culture"; so he still hoped for "great advancement in the happiness of the human race" (p. 179). But the ground of his hope remained the difference between briar or bramble and vine or olive, in his own metaphor of unchanging species: Men may be softened if we know what a man is, so that we know what a prickly or a softened man is.

Benson remarks that a surprising amount of Jefferson's thought concerned religion. He is right; religion was a problem in those days. But although Jefferson fought all his life for religious liberty, he did not go to the extent of our post-Darwinian indifference. Because he thought the nature of man was immutable and hence knowable, he was willing, as he said, "to make com-

mon cause even with error itself"; for man's natural moral sense may need to be sharpened by religion. We might ask, for example, which makes the more powerful indictment of slavery—the social scientist's accusation that it is ethnocentric, or Jefferson's famous blast? "I tremble for my country when I reflect that God is just, that his justice cannot sleep forever. . . ." Let us take note of the admission that God's justice can sleep for a long time. Yet Jefferson assures us that it will awaken; and he speaks with the confidence of a man who knows the truth of the matter, in contrast to the social scientist who has to worry that he himself may be ethnocentric. It is not out of greater honesty that liberals today do not make common cause with error, but because they do not dare.

Finally, it might appear from Jefferson's pre-Darwinian certitudes that he was more optimistic or complacent than liberals today. But on the contrary, he believed that a certain "pugnacious humor" seems to be a law of man's nature. This humor is responsible for war and slavery, and it must be restrained not only by the moral sense but also by the free government established in the American experiment. He knew that the experiment might fail because of the force of that humor, but he believed he had ground for hope in the better side of man's nature and in man's self-interest. This ground, as Benson shows in a critique of Daniel Boorstin, saved him from the complacency of living in a "lost world" of local and temporal circumstance. But in the post-Darwinian world of accidental change, no experiment is valid for mankind; and the alternative to despair is complacency. Who then lives in a lost world, Thomas Jefferson or ourselves?

Dr. Carl Binger is a psychiatrist able and willing to certify, in his book reviewing Jefferson's life before 1800, that Jefferson had a "well-tempered mind." Dr. Binger does not, therefore, examine the record of Jefferson's apostasies during his presidency—a record which caused Henry Adams to doubt that a well-tempered mind could hold Jeffersonian principles. Still, he finds enough contrariety in the period he has chosen to decide that Jefferson's mind was composed of opposites, especially the masculine and the feminine. These elements, he says, combined in an unconscious process to release Jefferson's singular creativeness. Perhaps we should doubt that "combined" is the right word for what his masculine and feminine elements did together in the dark, but at present we can wonder whether the result was pre- or post-Darwinian. Is the well-tempered mind a new creation, or as Dr. Binger

also says, a "normal" mind in the Platonic sense of "best"? In practice, Dr. Binger uses the latter, pre-Darwinian understanding with good sense and also with occasional, unobsessive resort to the formulas of a professional wig-picker. One could ask whether it is accurate to describe as "piling on the guilt" (p. 97) Jefferson's command to his motherless daughter to reread the letters he had written to her for her instruction. Was he not helping his daughter to live responsibly and thus avoid guilt? But on the whole it is welcome these days to read an analysis which assumes that masculine and feminine are elements of a well-tempered mind rather than roles in an ill-tempered society.

Benson and Binger offer a modern look at Thomas Jefferson, and they share the fault of underestimating the difficulties of appreciating Jefferson today. But both books are respectful of Jefferson's merits, unpresumptuous of their own, and well written.

HARVEY C. MANSFIELD, JR.

Harvard University

Academic Scribblers, American Economists in Collision. By William Breit and Roger L. Ransom. (New York: Holt, Rinehart and Winston, Inc., 1971. Pp. 275. \$8.50, cloth; \$3.95, paper.)

The intention of this book is to describe the ideas which have influenced recent American economic policy. Twelve economists are surveyed, beginning with Alfred Marshall, whose *Principles* was published in 1890, and ending with Milton Friedman, whose ideas are at the center of economics today (and are explained here very well). In between are Veblen, Pigou, Chamberlin, Keynes, Hansen, Samuelson, Lerner, Galbraith, Knight, and Simons.

Even to try to survey so much is commendable, and the authors have done more. They take the reader through the ideas of the twelve in a way that shows they are competent theorists themselves. By that standard, economists judge each other. They will not censure a man who is vague about Regulation Q and may think the better of him for being above such details. Even if he is cavalier about single-equation systems, he will not be scored off. But let him miss an implication of the principle of maximization, and he is in jeopardy. A corollary is his attitude toward theory. If he says it is unrealistic, irrelevant, or tautological, he will be suspected of not understanding it as well as he should and be reminded of what Lady Bracknell said in *The Importance of Being Earnest* ("Never speak disrespectfully of Society, Algernon. Only people who can't get into it do that").

The authors are quite inside the society of theorists. They are able to use the basic writings of the twelve and do not have to take their ideas from a commentary, a paraphrase, or a textbook. Thus what they say about Samuelson comes from his *Foundations* and other writings that earned him the Nobel Prize. The chapter on monopolistic competition rests on Chamberlin's celebrated work and on the criticism that has revealed the power of neoclassical economics. That power is indeed a leitmotiv of the book.

What is included in a book of this kind should be left to the authors. They in turn should leave us to regret their choices. About Marshall, they might have said more of his equivocal attitude to the market and self-interest and less of returns to scale. They are properly critical of Keynes but might have been more so in view of the many things that are wrong with his *General Theory*. "We are all Keynesians now," President Nixon said. He was not speaking for the economics profession. The remark is an interesting example of policy being influenced by ideas that have become defunct, something Keynes himself had noticed, though not about himself.

The authors, while trying to be accurate and clear, have tried also to be interesting, a difficult thing to do and better not done at all. Mies van der Rohe once said he didn't want to be interesting—he wanted to be good. What may be interesting here is the biographical chit-chat, but it is less valuable than the economic theory which could have been explained in the same space. The explanations, as they stand, are as accurate as they can be. They would be more accurate if they were longer.

How clear they are is another matter. Some are very clear, like that of the ideas of Abba Lerner who is a model of clarity himself. Others, like the Hicks-Hansen synthesis, will be uphill work for the outsider. But they will be helpful to an undergraduate. Graduate students will find some of them useful. A crisp new econometrician will do well to read the chapters on Marshall, Samuelson, and Knight, there to discover that economic theory has a past, present, and future, or simply to discover it exists. The chapters on Veblen and Galbraith ought to be read by economic theorists, who unfortunately are inclined to ignore what is not congenial to them. The entire book is useful as a history of some leading ideas of the century. Readers from outside of economics, although they will come across some stiff bits, will find it worth their while.

The book, however, does have a limitation:

from the authors' viewpoint, a serious one; from the reader's, less so. The reader can use it to inform himself about economic ideas and need not be troubled by whether or not they have influenced policy. The question must trouble the authors because they wrote the book to show that influence. I do not think they have. To have done so would have required a much longer and more complex book. The history of that relationship indicates policy has influenced ideas at times, has been influenced by them, has ignored them, has been consistent with them without meaning to, and has departed from them by chance. Each of these connections can be illustrated by foreign trade policy.

To believe ideas rule the world is a pleasant thought for the economist (so long as he doesn't think much about the world his ideas are supposed to have made). It is one of the illusions fostered by Keynes. He said, about "the ideas of economists and political philosophers," that "the world is ruled by little else," that "madmen in authority . . . are distilling their frenzy from some academic scribbler of a few years back." He gave the book its title—an unfortunate one. Economists are not that bad; neither are political philosophers.

WILLIAM D. GRAMPP

University of Illinois, Chicago

The Political Theory of Anarchism. By April Carter. (New York: Harper and Row, Torchbook Library Editions, 1971. Pp. vi, 116. \$6.00.)

Nihilism: A Philosophical Essay. By Stanley Rosen. (New Haven: Yale University Press, 1969. Pp. xx, 241. \$8.50.)

Terms of analysis become terms of polemic, to the confusion of scholars and actors alike. The subjects of the two books under review amply illustrate this; their diverse treatments also indicate something of the sort of rethinking which is needed for the era of postbehavioral politics.

April Carter's title seems somewhat infelicitous. At the outset Miss Carter (lately lecturer in politics at Lancaster University and currently tutor in the Open University) disarmingly grants that anarchist political theory seems a contradiction in terms. Yet she adds that anarchist thinkers are "spokesmen for values which the politically established and victorious have too often forgotten or suppressed." Is it simply a matter of positing "values"? Which ones—and in what sense *are* they, after all, "political"? Even on a sympathetic reading, the answers do not emerge readily from the following pages.

But in her conclusion, Miss Carter explains that her interest is the links between anarchism and more "orthodox" political theory. Specifically, she suggests that the contemporary relevance of anarchism is not its potential for a systematic new theory or pure anarchist movement (she considers both possibilities dubious), but as an aid to the *reinterpretation* of liberalism and socialism, providing some ideas which may be "partially realized" in the activities of popular groups over time.

Better if this came earlier, and more clearly. But in principle, it provides for a judicious mining of "anarchism." Thus, Miss Carter's first three chapters basically compare anarchism with three "orthodox" paradigms: Hobbesian individualism, Tocquevillean constitutionalism, and Marxian socialism. If there are few surprises here, and fewer philosophical depths, the discussions do offer more than a pure proclamation of "values." Implicitly they indicate something of the complex links among normative, empirical, and practical discourse.

The most interesting sections are those in which Miss Carter tries to grapple, on a more explicit and more fundamental level, with the notion of "politics." True to the anarchist spirit, she distinguishes a "social" principle of cooperation from a "political" one of domination and coercion. Yet she recognizes the Greek idea of politics proper as an area of activity among equals, and takes the primary definition of politics to be "the public" realm. And she sees a need to re-explore such ideas, to develop a sense of "citizenship" and "community" which she believes has almost vanished from the contemporary activities and meanings of politics. Her fourth chapter partly brings together these scattered comments. There she examines some "elements which appear to stand right outside the normal political sphere," but which "all have relevance to any attempt to define the sphere of politics and the nature of political activity" (p. 89). And there her figures are the individualist (Max Stirner), the artist (Camus), the moralist (Tolstoy), the hero (Hobsbawm on bandits), and the coward (Falstaff).

Potentially, this sort of discussion leaps beyond the other portions of Miss Carter's book. But only potentially. Miss Carter fails to consider Falstaff as a kind of rebel (a mocking comedian, a wise fool), as well as a man of caution. Her treatment of Stirner as an anarchist, while conventional, is none too penetrating. (R. W. K. Paterson's *The Nihilistic Egoist* [Oxford: Clarendon Press for Hull University Press], also published in 1971, offers a far more

problematical view.) Her only reference to Camus is to the abridged Penguin edition of *The Rebel*, from which Camus' most extended discussion of the pitfalls of artistic rebellion (sur-realism) and his comments on Stirner are missing. (Vintage offers a complete translation, although copyright restrictions may make it hard to obtain in England.) Conceptual problems underlie these lacunae: Miss Carter really provides no "political" integration. She does contrast her explorations with Hannah Arendt's "attempt to set limits to the political realm" in *The Human Condition*. But ironically, Miss Arendt would seem to offer something of the sort of conceptual resource which Miss Carter needs. She does not argue (as Miss Carter believes) that politics is completely separate from other realms such as science and art, but presents a phenomenological interpretation of that "cultural interpenetration" with which Miss Carter says she is concerned. To be sure, many of Miss Arendt's conceptions are double-edged. But so are the issues. Small wonder, perhaps, that from all her investigations here, Miss Carter seems to draw only a vague notion of "responsible citizenship"—one never clearly articulated, but ultimately presented simply as another abstracted "value." Shifting uneasily between reinterpretation and proclamation, her book cannot really be said to cohere.

Quite another matter is the book on "nihilism" by Stanley Rosen (professor of Philosophy at Pennsylvania State University). Superficially, the analytic task here might seem easier: Nihilism has no positive connotations, and Professor Rosen's approach is thus one of coherent attack. But (precisely because it is "negative"), nihilism poses far more profound problems than does anarchism. And what is significant about Professor Rosen's attack is the level on which it operates. Complex, densely written, treating a subject on which too little has been done in English (especially by students of politics), his book immediately plunges its readers into a conceptual feast. Those who expect to get a relatively straightforward ideological dissection or history of ideas will find themselves confronted with much richer fare. Even in the chapter entitled "Historicity and Political Nihilism" both the idiom and the focus are likely to prove unsettling. For Professor Rosen takes nihilism to be fundamentally a *philosophical* problem; and he means by that, things undreamt of in empiricist epistemologies.

Even in his statement of this thesis, Professor Rosen makes few concessions to his readers. But a summary of it serves most readily to indicate the nature of his discussion. The thesis can

be characterized as an elaborate extension of the Nietzschean definition of nihilism. Where "everything is permitted," he tells us, everything has equal worth—which means that nothing has any worth. But, he adds, this is only secondarily a matter of morality—and only secondarily a matter of our current historical situation. Nihilism is not a contingent phenomenon of historical practice, but a universal "theoretical" one, for it arises from the "dialectical" nature of man. "More fundamentally put, history, which in its modern sense has given rise to the modern form of nihilism, is a philosophical problem" (p. 137). Specifically, notions of morality derive from notions of rationality. And modern nihilism is essentially a problem of "the contemporary crisis of reason," "a radical deterioration in our conception of what it means to be reasonable" (pp. xiii-xiv), whereby the notions of the reasonable and the good have been detached, so that it is impossible to speak meaningfully of the goodness of reason. So it is that, in Professor Rosen's view, where everything is permitted, nothingness is manifest even in speech. Lacking any rationale, every "speech of justification" is really reduced to the senselessness and insignificance of total "silence." Reason becomes merely a matter of superimposing man-made categories on the world, a process of world-mastery which is also one of world-creation; man and nature are fused, and man's work becomes its own end and the only source of its meaning; philosophy thus becomes indistinguishable from poetry—and the goodness of *poiesis* becomes a purely "subjective" affair. Hence, for Professor Rosen, much contemporary "linguistic" philosophy is actually nihilistic; and the same is true of historicism, which takes the "ontopoetic" form of sacrificing the past for the silence of an unknowable future.

Politics thus recapitulates epistemology: no *logoi* without *logos*. Not for nothing is Professor Rosen the author of a previous work on Plato's *Symposium*. Here the *Republic* looms large in his recommendations for the resurrection of reason. But the treatment is by no means simple or doctrinaire. Professor Rosen acknowledges debts to two quite diverse masters, Leo Strauss and Alexandre Kojève. And he chooses as the special targets of his attack those two notoriously obscure moderns, Wittgenstein and (especially) Heidegger. A formidable array: the details of Professor Rosen's handling of it are impossible to reproduce here. By treating "nihilism" so broadly, and by taking Heidegger as his main focus, Professor Rosen at times appears to mirror the obscurity he

attacks. Theory, reason, speech, practice—one would like to have the crucial terms explicated in more leisurely a fashion. And similarly one would like amplification of many passages—the defense of Plato against Heidegger, with Plato's insistence on a return to the cave being taken as a *political* analogy which indicates a defense against nihilism (Is there no "silence" implicit in Plato's use of analogies?); the brief references to Marx (Could he not be said to have unified theory and practice only theoretically, rather than to have replaced the former by the latter?); the dispatch of Wittgenstein and ordinary language philosophy in a single chapter, as a conventionalist form of *poiesis* (Why no reference to the famous passage on calculation and *Lebensform*, in the *Remarks on the Foundations of Mathematics*? And how can Wittgenstein's notion of family resemblance be reduced to a "common form" which is "very much like a Platonic Idea" [p. 10]?).

Within this plump volume there are several slimmer ones struggling to get out. Yet it is a powerful book. The "dialectic" of conservative and radical with which Professor Rosen ends is provocative indeed, in its reintroduction of a classical content into a usually denatured term. His treatment of Plato contains much of value. And one general implication of his book is that "ontology," in some significant sense, is unavoidable—a point which needs reiterating nowadays. Some readers are liable to be put off by the obscurity and complexity. Others may reject the philosophical stance; many will choose to accept one set of notions and ignore others. It is doubtful that Professor Rosen's overall thesis will win much acceptance. But those who ignore his book do so at their peril. It vigorously poses issues which have been too long neglected by both political scientists and political theorists in English-speaking academe.

R. L. NICHOLS

Monash University, Australia

Politics and Social Insight. By Francis G. Castles. (Beverly Hills, California: Sage Publications, Inc., 1971. Pp. 137. \$6.96.)

This book, while issuing yet another call for interdisciplinary exchange, is at the same time germane to the continuing debate between positivism/behavioralism and historicism/anti-behavioralism in the social sciences. (For example, see this *Review*, September, 1972). The possibility for interdisciplinary studies rests on Castles' assumptions concerning the nature and methods for attaining knowledge in the social sciences. Acknowledging a partial validity to historicism and the relativity of knowledge, Castles

nevertheless argues that social scientists can assume their knowledge does have "pertinence to the problems of the real world" because it "can be tested by evidential reference to the real world," i.e., an empirical assertion can be "contradicted by all men irrespective of their normative frame of reference" (p. 44). Castles' rejection of historicism is biased by his implicit assumptions of the accessibility of the "real world" and the intersubjectivity of human knowledge. He rejects, however, an ardent empiricism by insisting upon the scientific utility of nonempirical statements that give "psychological impetus to scientific imagination and insight" (p. 45). By implication, the criterion of utility is apparently insight, not verifiability. He does accept empirical techniques as essential, but fears a "disproportionate emphasis on them." He bases his "limited confidence in the evidential basis of a science of man" (p. 45) upon the testability of empirical statement, falsification, and a "methodology of faith." Asserting faith in insight he turns to "metatheoretical models, and other untestable 'noble abstractions'" (p. 47) to provide hypotheses capable of being tested. While his insistence upon the "need for insights prior to investigation" (p. 46) is somewhat similar to historicism, their purpose is to generate testable empirical research. According to Castles, although metatheory is unscientific (unfalsifiable), it does serve a useful function and should be judged only by the utility of its insights. The book, then, fails in its sketchy, incomplete, and somewhat traditional attempt to develop a coherent middle position between positivism and historicism.

Castles, a British sociologist, emphatically rejects a narrow interpretation of politics, as well as any institutional and methodological restrictions on its study. Utilizing a paradigm which includes formal political structure and "wider social reality" he dismisses attempts to identify politics logically with any limited part of it. While eschewing the possibility of self-contained boxes such as "Descriptive Politics" or "Political Analysis," he also dismisses a political sociology that avoids political evaluation and prescription because of its "neurotic fear of being thought unscientific," and a political philosophy that is "unwilling to admit explicitly" its "reliance on the findings and perspectives of other disciplines" (p. 8). Since social science disciplines interpenetrate one another, to refuse to admit "the relevance of other disciplines" (including literature) is to limit the available range of insights. The same is true for research methods. There can be "no *a priori* assumption that the perspectives and methods of

a particular discipline are inappropriate" (p. 4). His argument, in my opinion, is compelling, but it is dependent upon the validity of his paradigm.

Finally, the author develops some familiar perspectives—the metatheories of functionalism, conflict, and anomie/mass society—which he deems important and fears will not be provided by a political sociology (by political scientists) which "takes from sociology only certain highly visible elements, and not all those perspectives that would be available to a general sociology of politics" (p. 11). Exactly why political scientists are more imprisoned in their discipline than sociologists is left unexplained. Castles takes Rex's ideal types of individual interactions, "perfect co-operation, perfect conflict, and perfect anomie" (p. 13), develops these into three idealized ways in which individuals can react to societal norms, and finally, creatively delineates how these concepts express the core insights contained within his three metatheories. "Perfect co-operation" becomes the core insight of structural-functionalism, with its emphasis upon system stability; perfect conflict between individuals prefigures social conflict theory; and perfect anomie, or individual normlessness, stimulates the approach of contemporary theorists of mass society. His development of these three orientations is well done, but offers very little that is new.

Unfortunately, in a book as brief as this many ideas are merely hinted at; his two-page conclusion only suggests that these conflicting metatheories might be complementary—each concentrating on a different level of human behavior (i.e., conflict at the group level, etc.)—and necessary for a balanced perspective. The book is dated; most of its sources are pre-1968; nevertheless, it is a worthy interdisciplinary effort that could be utilized in a variety of undergraduate courses.

STANLEY W. MOORE

Pepperdine University, Malibu

Civil Disobedience: Conscience, Tactics, and the Law. By Carl Cohen. (New York and London: Columbia University Press, 1971. Pp. 222. \$2.95.)

Civil Disobedience: Theory and Practice. Edited by Hugo Adam Bedau. (New York: Western Publishing Company, Inc., 1969. Pp. 282. \$1.95.)

It has often been observed that American political thought has tended to treat fundamental philosophic problems as self-evident truths. Not

given to philosophizing about politics. American political thinkers have instead produced a body of thought preoccupied with mechanical problems and characterized by legalistic, technical discussion. The best contemporary evidence of the continued validity of this criticism is the recent profusion of works on civil disobedience. Only in America could Abe Fortas's *Concerning Dissent and Civil Disobedience* be condemned as authoritarian, repressive, and fascist. Virtually all of the writers on the subject concede the necessity—indeed, the desirability—of civil disobedience under certain circumstances. The debate is, thus, reduced to questions of where, when, and how. A particular thinker's liberalism or conservatism can then be measured by placing him on an "ideological" scale ranging from those who see the streets as a sort of public forum to those who suggest that they might also be used for the conveyance of traffic.

Both of the volumes under review manifest the narrowness of this theoretical framework. Professor Cohen's book is full of observations and insights which, in the hands of a Burke or a Burckhardt, might serve as the premises upon which a radically thoroughgoing critique of civil disobedience could be constructed; Professor Cohen, however, comes down on the disobedients' side. Professor Bedau's anthology presents not divergent points of view but variations on a theme. This is not to deny that either is useful reading on its own terms. But the reader must be aware of the limitations of those terms, lest he approach either book with unwarranted expectations.

Professor Cohen sets himself the task of developing a philosophic framework within which "individual acts [of civil disobedience] may be more fully understood and appraised" (p. 210). Despite a yeomanly effort, he does not entirely succeed.

For Cohen, "civil disobedience is an act of protest, deliberately unlawful, conscientiously and publicly performed" (p. 39). It is *not* simply public protest; it is *not* conscientious objection; it is *not* rioting; and it most definitely is *not* revolution. In his uncompromising assertion that civil disobedience is reformist only and not revolutionary, Professor Cohen will not win the accolades of those such as Professor Howard Zinn who maintain that it can be either. Nor will he endear himself to the apologists of the New Left by maintaining that civil disobedients "should be punished" (p. 76), not for their civil disobedience, but for their deliberate, albeit conscientious, violation of a particular law.

Having set forth what civil disobedience is

not, Cohen distinguishes four genera of civil disobedience: direct and indirect, political and moral. (By recognizing as legitimate indirect civil disobedience, i.e., the violation of a law which is not itself the object of protest, Cohen, of course, goes beyond what Fortas would accept.) He further sorts out several species of political disobedience (civil disobedience toward the realization of a desired result rather than simply a public statement of personal conscience), i.e., pressure, confrontation, and resistance.

After establishing these criteria of recognition, Cohen turns to the task of identifying criteria of justification. From the outset, he disclaims "any effort to show that civil disobedience, taken generally, is always justified, or is never justified" (p. 93). Maintaining that justifications are contextual, he examines the legal, moral, higher-law, and utilitarian justifications for civil disobedience, but though he rigorously and inclusively states the problems, he resolves none of them. Rather he turns to a critique of seven arguments against civil disobedience. But to demonstrate the inadequacies of your opponents' arguments does not substantiate the validity of your own. Indeed, in his last two chapters Cohen examines and finds wanting two of the most common contemporary arguments advanced to defend much civil disobedience, those based upon the First Amendment's protection of the freedoms of speech and assembly and upon the Nuremberg Judgments. These unquestionably are the most satisfying presentations and manifest a familiarity with and understanding of judicial precedents and processes too often lacking among legal philosophers.

Cohen's examination, however, is disturbingly bland and bloodless. Interspersed throughout the text are nineteen case histories; dealt out like so many playing cards, these actual examples of civil disobedience are sometimes used for illustrative purposes but are never analyzed at length. Had Cohen done so, he might more clearly have recognized the morally disturbing potentials which civil disobedience presents. Although he cautions that "civil disobedience is not child's play" (p. 35), Cohen never seems to appreciate the tensions which exist in real-life disobedience situations. The behavior I have witnessed as a graduate student and faculty member in California during the past decade bears not the slightest resemblance to the rosy fantasy which Cohen apparently uses as his model. He asserts that civil disobedience "invariably . . . is . . . civilized" (p. 31); my own observations suggest that

many civil disobedients seem to have a commitment to hostility.

In the end, Cohen's analysis is equivocal. But perhaps his equivocation arises because he has forthrightly attempted to deal with a difficult subject not susceptible to the facile treatment, rhetorical sleight of hand, and oversimplification characteristic of Zinn and his ilk. Unlike Zinn, who advocates unlimited freedom of expression for the "good" guys only [see Zinn's book review, 85 *Harvard Law Review* 897 (1972)], Cohen recognizes not only that there must be some limitations upon civil disobedience but also that what's good for the Weathermen is good for the Ku Klux Klan. In this respect, Cohen's analysis, whatever its shortcomings, is a welcome, even-handed redressing of the balance in the literature on this subject.

Much the same may be said of *Civil Disobedience: Theory and Practice*. Professor Bedau has drawn together in one reasonably brief and inexpensive volume several thought-provoking statements on the subject. Following an introductory essay by the editor and an excerpt from Thoreau, the book is divided into three parts. The first section deals with civil disobedience against racism. The second is entitled "Against War," and the third presents four abridged essays debating the justifications for civil disobedience. The book's virtues, however, are also its vices. Perhaps if one has seen one reader on civil disobedience he hasn't seen them all, but it seems that way. Certainly, *Civil Disobedience: Theory and Practice* duplicates several collections of readings already available. Moreover, Bedau has achieved a brief volume either by selecting several essays too short to permit developing important themes or by utilizing the editorial scissors too freely. But, on the whole, the merits outweigh the defects, and the volume's inclusiveness and its price make it pedagogically attractive for use in political theory or public law instruction.

It should be apparent from these somewhat impressionistic appraisals that Cohen's analysis and Bedau's anthology are both worthwhile either for personal reading and edification or for class assignments. But the American Camus has yet to make his appearance.

RICHARD Y. FUNSTON

California State University, San Diego

On Historical and Political Knowing: An Inquiry into Some Problems of Universal Law and Human Freedom. By Morton A. Kaplan (Chicago: University of Chicago Press, 1971. Pp. 159. \$6.50.)

On Historical and Political Knowing, though

a long soliloquy, is nonetheless much too short for tackling all the questions the author feels he is up against: "What do we mean by truth, by meaning, by freedom, whether of a particle of a man, or an organization? What do we mean by prudence of action in an uncertain world?" (p. xii). Professor Kaplan, dismayed by what he perceives as defection from the ideals of science, attributes the mischief to certain "current misconceptions" that "lie, at least in part, in the realm of philosophy" (p. vii). The philosophical foe is divided into two camps: the "common language" philosophers, represented by Dray and Scriven, who would seemingly abandon the methods of systematic social science in favor of raw, untestable intuition; and the ideologists—those ancient enemies Hegel and Marx—whose siren songs apparently still have the power to lull social scientists into shipwreck upon the rocks of dogmatism. The "good guys" include Peirce, Dewey, Morris Cohen, Karl Popper, and Carl Hempel, though it is chiefly Hempel (and his formulation of the covering law model of explanation) upon whom the author relies in his philosophical battles.

Professor Kaplan is no unreconstructed positivist or scientific hardhat preaching the *realpolitik* of tough empiricism. Rather, he is sensitive to a dimension of scientific inquiry that he variously calls "existential" or "subjective," a dimension which sets limits upon what can be objectively known by positive science. Professor Kaplan is somewhat ambiguous in describing how this theoretical limit operates upon inquiry, for he cites as evidence of its existence such diverse things as relativity theory, Heisenberg's uncertainty principle, and Gödel's incompleteness theorem: "In the realm of logic and mathematics, Gödel has shown that any mathematical system that can be shown to be consistent is necessarily incomplete in the sense that it cannot be used in principle to prove all true statements involving the symbols in the axioms" (p. x). Such brief references, however, cannot be considered more than ceremonial, and, in any case, Professor Kaplan is wrong about what Gödel showed; many mathematical and logical systems are both consistent and complete. At times Professor Kaplan portrays the theoretical limit of science as posed by a "problem of self-reference: the fact that the act or state of knowledge cannot include itself" (p. xi). At other times, the epistemological borders of science are set by the consideration that "all scientific models, whether biological or physical, are necessarily closed and complete; and all existential worlds including even those of physics are necessarily open and

inexhaustible" (p. 143). "The world of knowing is open" Professor Kaplan insists, "the world of the known is closed. The world of knowing is the world of continuing interaction. The world of the known is the world of closed scientific explanations and of analytic truths" (pp. 144–45).

Are we being offered a counsel of hope, a celebration of existence over theory, freedom over prediction and control? Not at all. Freedom, in Professor Kaplan's conception, "cannot be examined apart from the constraints imposed by the characteristics of an entity. A ball on a surface has the freedom to act in accordance with the laws of mechanical equilibrium but not to run along tracks. A railroad train has the freedom under appropriate circumstances to move along the tracks in whatever direction the tracks go" (pp. 146–7). Are those examples the best paradigms for exploring the concept of freedom? Professor Kaplan, to be sure, maintains that freedom has to be redefined "for different kinds of entities" (p. 146). "The freedom of a ball to roll is dependent on its globular shape. The freedom to act morally depends upon a framework for and a capacity for moral choice" (pp. 156–7). If there is a difference between such "freedoms" as the "freedom" to roll and the "freedom" to act morally, Professor Kaplan's apposition nonetheless conveys a belief in their similarity. His entire discussion of freedom emphasizes what many would take to be the very opposite concept; namely, that of constraint. For he contends that "every freedom requires a set of consistent constraints. These constraints are not mere limitations on the specified types of freedom but are the very grounds for their existence" (pp. 157). I don't think the "ideologists" whom Professor Kaplan deplores would find his conception of freedom too objectionable.

The most interesting discussion in *On Historical and Political Knowing* is contained in those sections where Professor Kaplan attempts to settle the hash of the "ordinary language" school. At issue are certain criticisms of Hempel's covering law model of scientific explanation, criticisms that Professor Kaplan finds irrelevant, or worse. Now, the covering law model of explanation was, among other things, an attempt to provide an anatomy of the notion of explanatory power. "Why do explanations explain?" was one of the basic questions that the model was supposed to answer. But before that question can be answered, one must first decide what an explanation is. For Hempel, an explanation is basically a certain kind of linguistic entity—an *argument* having premises

and a conclusion, and not a single sentence as many of Professor Kaplan's examples erroneously suggest:

(a) "Poison kills" is a truistic explanation of an apparent "why" type (as is "power corrupts") but a weak and unreliable one. (b) "Poison deprives the blood of oxygen" is a better explanation that begins to answer "why" type questions. (c) "Poison deprives the blood of oxygen, leading to cellular brain damage, leading to non-transmission of neural messages across synapses, leading to the cessation of breathing and the stoppage of the heart, in the absence of which life is not possible" is still a much better explanation of the "why" type (pp. 18-19).

Hempel's "ordinary language" opponents tend to conceive of explanations basically as acts of communication rather than linguistic entities. Each of the major components singled out by Hempel as an essential element of explanatory power—deductive validity, generality of premise, truth of premise, etc.—has been disputed as not being essential for explanatory communication. Consider, for example, Professor Kaplan's own illustrations cited above. Neither (a) nor (b) nor (c) is an argument, and therefore none of them can be "deductively valid." None of them is true ("systemic" poisons such as prussic acid operate in the manner indicated by (c) but "corrosive" poisons such as lye do not). But these "failures" need not prevent any of the above sentences from being part of a successful explanatory act of communication. For example, if someone wants to have explained to him why Jones expired after taking prussic acid, asserting (c) might do the necessary explanatory job, even though (c) is false, provided that it was clear to all parties that one was talking about the particular incident and not about all incidents of poisoning. Nor is asserting (c) necessarily a better way of explaining something than asserting (b) or (a), as Professor Kaplan maintains, for suppose a person didn't understand what synapses were. It must be conceded to Professor Kaplan that opponents of the covering law model have not yet explained, in satisfactory fashion, why explanations explain, but it is surely wrong to consider, as Professor Kaplan tends to do, that the attack on the covering law model of scientific explanation is an attack on science itself.

HASKELL FAIN

University of Wisconsin

The Party of Eros: Radical Social Thought and the Realm of Freedom. By Richard King. (Chapel Hill: University of North Carolina Press, 1972. Pp. 227. \$7.50.)

Political Hysteria in America: The Democratic Capacity for Repression. By Murray B. Levin. (New York: Basic Books, Inc., 1971. Pp. 312. \$8.50.)

Radical Libertarianism: A New Political Alternative. By Jerome Tuccille. (New York: Perennial Library, 1970. Pp. 130. \$1.25.)

King, Levin, and Tuccille all explore radical ideas, groups, or thinkers operating in American political life. King examines the views of left-wing theorists in America who have been noted for their defense of sexual liberation—theorists such as Reich, Goodman, Marcuse, and Norman O. Brown. His study presents a chapter on each of his figures, reporting their history, the pattern of the development of their thought, and their essential message. It is basically a book to explore for information rather than argument. Levin considers the fate of radical dissenters in America since the days of the post-World War I Red Scare. His purpose is to study such broad themes as American political psychology, American political ideology, and their interactions with our political experience. His conviction is that for most of this century our liberal consensus has allowed us to repress dissenters far too often and in violation of the possibilities of America. Tuccille enthusiastically reports on the emergence of a genuinely radical-libertarian faction within American conservatism. He discusses the program of contemporary radical libertarians and its recent history, and he puts forth a vigorous argument for this political position.

Whatever their similarities, however, these three books are substantially different in style and quality. Professor King's *The Party of Eros* is a work of careful scholarship. Unlike so many books about currently fashionable thinkers on the Left, his book avoids uncritical adulation as well as polemical denunciation. Generally, King is a calm, thoughtful chronicler. His treatment of Marcuse is an especially powerful illustration of his approach. King refuses to succumb to the temptation to leap into the controversies that surround Marcuse and his work with yet another highly tendentious position at the expense of the goal he seeks: a precise, disciplined elucidation of Marcuse's ideas.

King does develop his own view sharply and quite fully in a concluding chapter. There he indicates his substantial reservations about "the party of Eros." He also links "the party of Eros" to some extent with the gurus of the counterculture. This judgment seems to confuse genuinely creative social thinkers with second-rate popularizers, such as Charles Reich.

King often raises probing questions, which

he poses quietly and sometimes devastatingly. But at other times his balanced considerations are a bit lifeless. Perhaps the problem is that he chose to analyze each man's thought chronologically, book by book. This tends to turn his chapters into excellent book reports. King also may be faulted for a curious emphasis in a book about sexual radicals: he seriously neglects Brown, while dealing at length with Goodman, a mild sexual radical at most. In fact, King's chapter on Goodman is fascinating and revealing, but his brief consideration of Brown is less successful. He does not enter Brown's world, nor does he seem to want to. There is little evidence that King appreciates Brown's puzzling, but also dazzling, creativity. Consequently, King does not give us a full sense of Brown, and since Brown is surely the most radical thinker of the group, this is a disappointment. When one finishes King's *The Party of Eros*, however, one knows he has read a book that is learned, thoughtful, and balanced.

Professor Levin's *The Politics of Hysteria* is interesting when it discusses the Red Scare of 1919. Insofar as it is a case study of an example of "the democratic capacity for repression" it seems to have lessons to teach. But as the reader moves through each of the seven chapters, the book becomes progressively more focused on exposing a seemingly endless list of sins in contemporary America, especially including our bondage to sundry myths of the liberal tradition. In his chapter six, Levin makes clear his dependence on Louis Hartz's analysis of America in *The Liberal Tradition in America*, but he converts Hartz' doubts about American liberalism into stinging condemnations, regarding the liberal tradition as intolerant, repressive, nationalistic, "totalistic" and generally quite without any saving graces.

Levin's book gives a social-psychological overview of the supposed propensity of Americans to fall victim to myths and conspiracies. His fourth chapter concentrates on this particular weakness of America, but Levin's analysis is so general and so intensely normative that it falls well short of the standards of many practicing political psychologists, including those he cites, such as Murray Edelman.

Underlying Levin's discussion is an outraged radicalism. Levin protests inequities in this country in the name of social justice and individual liberty. But at the same time he is apparently no admirer of the common person; he depicts the average American as little more than a fool, readily manipulated by elites skilled at myth-making and trickery. Thus while he be-

wails the elitism he sees in American society, he ignores the elitism that is central to his own outlook.

Jerome Tuccille's *Radical Libertarianism*, represents yet another style of book. Tuccille is one of a group of writers today, including the more famous Karl Hess, who have written and thought about the connection of the radical Left and libertarian Right. Tuccille's book, which is utterly devoid of Levin's chic misanthropy as well as King's scholarly accomplishment, is designed to encourage an awareness of the right-wing form of libertarianism. He presents, in a spirited and subjective way, the dubious case for a political outlook which includes a kind of free capitalism plus virtual political and social anarchism.

This might be a good book for a contemporary issues or modern political theory course. It is easy to read and often entertaining, especially in its wonderful description of the clash at the 1969 Young Americans for Freedom Convention between the libertarians and the more traditional conservatives. It also raises many issues of importance, including the utility of present political labels, the future of conservatism, the role of the state, and the validity of thinking in terms of abstractions like the "public interest."

Tuccille wants to get rid of everything statist from the draft to welfare to pollution controls. His reliance on the reduction or abolition of the state to solve every problem is often excessively monistic: for instance, holding lotteries and bazaars is not likely to solve the welfare mess, nor are private means particularly likely to stop pollution. But Tuccille is a constantly lively and inventive disputant, who can teach something to any reader.

ROBERT BOOTH FOWLER

University of Wisconsin, Madison

Political Theory and Political Science: Studies in the Methodology of Political Inquiry. By Martin Landau. (New York: The Macmillan Company, 1972. Pp. xi, 244. \$6.95.)

Martin Landau lets the cat out of the bag early: "There are, frankly, many people who are just dumb, or who ply fashion and ride bandwagons—or whatever. The theory of probability tells us that this will be so in any population, whether traditionalist, behavioralist, or post-behavioral revolutionary. Vitiating, then, scientific methods on this count is like invalidating baseball because there are lousy batters" (p. 12). He puts the cat back in the bag two hundred pages later in a comment on the science-art controversy in public administration

that can be extended to all political science: "... this controversy, and its attendant confusions, has led to a good deal of acrimonious debate ('quarreling' is perhaps more accurate) which has more to do with the problem of professional status and self-identity than with the intellectual issues involved" (p. 202).

In between, Landau gives the lie to Schiller's dictum that "against stupidity the very gods themselves contend in vain." In a series of sophisticated essays on the methodology of political investigation, Landau neither plays God nor puts up with dumbness, fashions, or professional quarrels. Carefully selective in the choice of some very smart people as his intellectual targets, or better, of their arguments, he cuts through metaphorical nonsense, spongy conceptualizations, opportunistic double-talk, empty rhetoric, ideological dogmas, sloppy thinking, professional distemper, political *Weltschmerz*, and other disciplinary maladies to which we have been treated, if not accustomed, in recent years.

However, Landau's critiques are not for critique's sake. The objective, throughout, is to clarify what science can or must mean in political science, and he does so with great elegance in thinking, with great economy in writing, and with great seriousness in purpose. Beyond these virtues, there is another that has of late been in short supply—an extraordinary dose of mental sanity. He enjoins us, for instance, that before using, misusing, or abusing Kuhn's interpretation of normal science and scientific revolution, we had better consult the historians and philosophers of science, who, on any number of grounds, are something less than enthusiastic about this particular theory of knowledge making. Or he suggests that we apply Mannheim's sociology of knowledge to Mannheimian analysis itself and see what we get—intellectual chaos (of which we have a great deal in any case). But all of this is done without the kind of pejorative style that, in some academic circles, has become a substitute for thought. Indeed, Landau proves himself to be a twentieth-century thinker (if I may use a perhaps obsolete term) in the tradition of the Enlightenment. If that makes him a traditionalist, so be it. If it makes him a post-, post-post, or post-post-post-something-or-other, that's even better.

Although written over a period of ten years, the eight essays brought together in this volume do not constitute the usual potpourri of miscellaneous writings by a prolific author. They are held together by a single theme that is given its most precise statement in the last chapter, on "Due Process of Inquiry." I have rarely read so

sensible a statement of what the "rules of method" in scientific discourse are all about; and the reader may well want to begin with this chapter as a more systematic introduction to Landau's thought as a whole than can be found in the first chapter, not previously published, on "Science and Political Science: Some Observations on Prevailing Complaints" in which Landau defines his own observational standpoint in the context of contemporary disciplinary polemics.

Landau's approach to methodology is by way of inquiry into the vocabulary and grammar of political science. The approach has its richest payoff, it seems to me, in another previously unpublished paper on "Objectivity, Neutrality, and Kuhn's Paradigm"; but its simplest and perhaps clearest treatment is found in the earliest essay, published in 1961 and entitled "On the Use of Metaphor in Political Analysis" (Chapters 2 and 3). The approach is further applied and exemplified in Chapters 4 and 5, "On the Use of Functional Analysis in American Political Science," and "The Myth of Hyperfactualism in the Study of American Politics." I am reciting the chapter titles to give an inkling of the broad range of Landau's concerns and to alert the book's large potential audience, but also to suggest why I cannot possibly devote sufficient space to reviewing the subject-matter of any particular chapter.

The importance of the "dictionary problem" is demonstrated in Chapter 6, "Development Theory: Some Methodological Problems," which begins with an analysis of Riggs's optical lexicon and ends with a discussion of the difficulties involved in epistemic correlation between facts and values, or means and ends. The problems of grammar and vocabulary are most critical where theoretical knowledge and applied knowledge meet, and where the languages of science and the languages of common sense are being confronted. Enthusiasts of the "cult of relevance" might give particular attention to Chapter 7, "Political Science and Public Administration: 'Field' and the Concept of Decision-Making." Because their memory is short (and, I daresay, their knowledge of our discipline's history limited), they may discover why the "post-behavioral revolution," so called, is mostly old hat for those who have lived through the years of torment when the subfield of public administration was in search of a "field." Even what Landau, responding to Easton's curious reversal of position, has to say on "relevance" in the opening chapter may become relevant.

Needless to say, perhaps Landau's thought is

so agreeable to me because I agree with most of it. Beyond this, however, Landau emerges in this book as one of the most erudite of contemporary scholars in political science—and erudition is in short supply along with sanity. He is clearly at home in our own discipline, but also in the other sciences and in the philosophy of science. I have really only two related comments to make. On the one hand, for those of us who spend most of their time in the crucible of empirical research with its emphasis on technique, Landau's rigorous conception of method and its problematics will serve as a reminder of the fragility and perishability of our labors if they are not grounded in "due process of inquiry." On the other hand, while I appreciate Landau's insistence on methodological clarity, if not purity, I must ask him to sympathize with some of the theoretical and technical compromises that theory-oriented empirical researchers tend to make and, in the present state of disciplinary development, perhaps must make, if they are to come up with at least some tangible discoveries before senility overcomes them. Granted that we stand on the shoulders of giants and move pebbles rather than boulders—to mix a metaphor. But, then, as Burton's saying goes, "a dwarf standing on the shoulders of a giant may see farther than a giant himself." I am confident that Martin Landau appreciates this more than do lesser minds.

HEINZ EULAU

Stanford University

Social Determinants of Moral Ideas. By Maria Ossawska. (Philadelphia: University of Pennsylvania Press, 1970. Pp. xii, 190. \$9.50.)

Maria Ossawska has written a charming and informative book on the sociology of morals, a nonsubject that may some day become a subject. Although she is a distinguished Polish philosopher, not a professional sociologist, Professor Ossawska writes more about society than about morals, perhaps because she doesn't question what "society" means, but thinks "morals" is indefinable. One might suppose that the indefinability of a key term would make her pessimistic about the future of her subject, but that is not the case. Professor Ossawska believes there is a genuine sociology of religion, and that "religion," too, is indefinable, so she proceeds happily to try to develop a sociology of morals.

In order to be a social science, the sociology of morals must first contain descriptions of the morals of a society at a given period of time and, second, formulate laws specifying that one

moral code emerges, flourishes, wanes, and dies under particular social conditions and that another moral code has the same fate under other social conditions. Ossawska foresees little difficulty in moral description, and quotes Durkheim approvingly: "Moral facts are facts like any others; they consist of rules of action which can be recognized by some distinctive characteristics; thus it must be possible to observe them, to describe and classify them" (p. 17). It is in finding social determinants of moral ideas (promised in her title) that Professor Ossawska has greater difficulty.

Still, the difficulty in sheer description of the moral ideas prevalent at any time is revealed by Ossawska's taste for ideal types. If one can't actually describe an accepted moral code in all its nuances, and in its variations from a philosophical statement of ideal belief, one can substitute the philosophical statement for it. Thus the actual beliefs of a hedonist society are unlikely to be exactly what Aristippus or Epicurus said about pleasure and pain, but if one can't describe what the people in that society believe, with genuine differences from group to group and person to person, one recourse is to restate Aristippus or Epicurus and call that more or less systematic exposition an ideal type. In choosing the ideal type rather than the living belief, Ossawska writes as a philosopher rather than a sociologist, although she has the massive authority of Max Weber behind her choice.

Yet the social determinants of moral ideas are more difficult to establish than the prevalence of those ideas. Ossawska spends fifty pages constructing ideal types of the bourgeois ethos and the nobility ethos. The very names suggest that these moral codes, or some variant of them, emerged with particular socioeconomic classes and will probably wane or die with their disappearance. However, Ossawska denies that correlation and, indeed, can discover no social determinants for either ethos. The morality of Hesiod, she points out, as enunciated in his *Works and Days*, was very similar to the ideal bourgeois type, and the ethos of the nobility can be found in some pastoral groups of mountain dwellers.

When Ossawska utters one of her rare positive conclusions, the difficulty of establishing particular social determinants for moral ideas is most apparent. A typical conclusion is that the lack of disapproval of homosexuality in contemporary Japan is probably the result of overpopulation. One standard scientific reading of this assertion is: Under conditions of overpopulation, the people of a nation do not disapprove

homosexuality (Japan is overpopulated; the people of Japan do not disapprove homosexuality). On this reading, it makes sense to say that the assertion, the Japanese do not disapprove homosexuality because Japan is overpopulated, is true only if there is a general law to the effect that such attitudes always occur in overpopulated nations. To establish the general law one would have to examine other overpopulated nations, like India, and discover the same attitude. The law, I suspect, would not fare well.

On still another reading, Ossawska's statement becomes: Under specified conditions of personality and character (based, to be sure, on particular traditions and social environment), the people of a nation respond to overpopulation by ceasing to disapprove homosexuality. One trouble with this reading is that, when we specify all the traits of personality and character, we will probably be talking only about the Japanese. And it will be very difficult to know what traits are relevant to this special response to overpopulation. If we find there are other peoples with the traits we think relevant, they will have to live in an overpopulated nation or we cannot use their behavior as evidence of the truth of Ossawska's assertion. Such are some of the hazards in trying to develop a sociology of morals.

Like the sociology of religion, the sociology of morals would be almost denuded of experiment and would rely heavily on descriptive and statistical findings, questionnaires, interviews, and history. Comparative and historical study would search for social conditions present when a moral code is also present and absent when the code is absent. Just as the sociology of religion does not question whether any religion is true, the sociology of morals will not question whether any moral code is good. But both subjects can be concerned with the adequate or inadequate functioning of a religion or a moral code in a society at a particular time. For example, under some conditions, prevalent moral ideas may perform the function of adjusting and adapting social activities to each other; under other conditions, the same moral codes may be nonfunctional or dysfunctional. Religions are in just the same case. Under some conditions, they provide a social cement; under others, when there is, for example, an encounter of religions, as in seventeenth-century Europe or contemporary Ulster, they make for bloodshed and chaos.

An examination of the functioning of morals may bring social and political conclusions that social study without a moral component would

miss. Ossawska would not approve because she is suspicious of all functional theory, but if we cannot improve on her practice I fear the sociology of morals will be still-born.

Sexuality and Class Struggle. By Reimut Reiche. (New York: Praeger Publishers, 1971. Pp. 175. \$6.95.)

As regards sex, W. C. Fields once remarked, "There are some things better and some things worse, but there is nothing quite like it." Perhaps something similar can be said about the treatment of sex in social science literature: there is nothing quite like those books that attempt to blend eros and Marxism, psychoanalysis and socialism. One thinks immediately of works by Reich, Adorno, Marcuse, and Osborn, among others, and, at another level, of the sex-and-politics graffiti that in recent years youthful revolutionaries have scribbled on German, French, and American walls. The message of most of these books and graffiti was that capitalism and war promoted and thrived on sexual repression, whereas socialism and peace were both cause and effect of good healthy orgasms. It followed from these assumptions that efforts to restrict sexual freedom, whether emanating from religion, law, conventional morality, or the institution of marriage itself were, in a word, counter-revolutionary. While it is unlikely that such revolutionaries as Chairman Mao, Fidel, and Brezhnev subscribe to these views, most young radicals, especially the German Marxists, continue to regard the sexual revolution as an indispensable accompaniment of economic and political revolution.

German Marxist Reimut Reiche—one is tempted to refer to him as the counter culture's Third Reiche since he follows hard after Wilhelm and Charles—takes sharp issue with the position that monogamy, fidelity, homosexuality, and the institution of the family itself will necessarily, like the state, wither away in a Marxist society; indeed, he is at pains to demonstrate that, far from disappearing, such practices and institutions will take on a purity of meaning and function that they are incapable of achieving in any capitalist order. In Reiche's opinion, the capitalist *Playboy-Penthouse* ethic, because it is dominated by market values, inevitably emphasizes the quantitative aspects of sexual freedom as opposed to the qualitative side. But for Reiche, the quantitative or "anything goes" aspects constitute a "false

sexuality," the sexual counterpart of the "false consciousness" that the Marxists have always opposed to true working-class consciousness, i.e., awareness of the class struggle. True sexuality, according to Reiche, does not consist of unlimited single and group copulation, access to pornography, legalized prostitution, lessons in masturbation, and the like, but is basically made up of "full genital sexual enjoyment." True sexuality, in short, involves what Erikson has called "mutuality" or the capacity to feel, to respond, to empathize, to give as well as to receive.

Indeed, if I understand Reiche correctly, true sexuality cannot exist without love or at least deep affection, and here he is parting company not only with the practitioners of sexual politics, in Germany and elsewhere, but with the orgasm supremacists who dominate the encounter-group movement. Unlike the former, Reiche does not assume that free love in a commune is an adequate substitute for the bourgeois family; unlike the latter, he does not believe that sexual satisfaction is almost entirely a matter of tactility and technique. Building on what is essentially a psychoanalytic model of child and adolescent development, Reiche argues that there can be no maturity for the individual unless he can leave behind him the oral, anal, and phallic states of development as he moves toward "genital primacy" and the capacity for healthy object relations.

Reiche also maintains that such growth is impossible except in a socialist society, and here, of course, many who are equally critical of our sex-as-a-commodity culture will be inclined to disagree. Does "true sexuality" exist in any of the socialist countries, and if so, where is the evidence? Perhaps more important, what is the historical, philosophical, or logical proof for the proposition that relations between the sexes in a socialist society will be inevitably more humane than such relations in a capitalist society? It is not enough to demonstrate that sexual needs are perverted in the contemporary western capitalist world, and it is even less adequate simply to assert, as Reiche does, that "true sexuality" can be achieved only under socialism. Would that this were so! How glorious it would be if we could still believe, as many of us once did, that socialism would usher in the era of perfectible man! Perhaps it all is a matter of faith, and in that event it is absurd to demand more evidence or logic from Reimut Reiche than from, say, Pope Paul. Surely Mr. Reiche is as much entitled to his "next world" as the Pope is entitled to his—and considering that Reiche's includes "true sexuality," who

would want to emigrate from it to eternal but sexless salvation on the Mount of Olives?

ARNOLD A. ROGOW

Hebrew University and City University of New York

Systematic Thinking for Social Action. By Alice M. Rivlin. (Washington, D.C.: The Brookings Institution, 1971. Pp. 150. \$5.95.)

I have no idea how far back in history it is necessary to go to identify the early pleaders for rational decision making in government. Certainly a knowledge of either Latin or Greek would be essential, and the scrolls with the earliest admonitions must be in very delicate shape.

But the voices of both the distant and immediate past have done little in the human resource area either to create order out of chaos, to bring about effective distribution of public funds instead of ad hoc allocation based on political expediency, or to institutionalize systematic assessment of program efficacy. This book, based on a series of lectures that Alice Rivlin gave at the University of California at Berkeley, is both a concerted call for continued efforts to improve the way government works and a sensitive analysis of why the strategies of the past several decades have yielded so limited results.

Dr. Rivlin is admirably qualified. A well-trained economist now at the Brookings Institution, she has extensive experience in government, including a stint as Assistant Secretary of HEW with responsibilities for planning and evaluation. In the essays in this book, her worldly knowledge is intertwined with her scholarly learning. Indeed, an expanded bibliography might have made the volume more valuable for the student and for those not fully familiar with the literature in the area.

The early chapters of this brief book focus on (1) cost-benefit analysis; (2) specification of social goals, indicators of social change and comparative payoff from programs; and (3) evaluation of program impact. They are followed by more extended discussion of strategies for program evaluation. In each discussion, Dr. Rivlin makes use of her intimate knowledge of federal programs on education, income maintenance, and health. She argues strongly for innovative programs and their assessment, large-scale social action experiments and program accountability. She is quick to acknowledge the limited utility of work up to now and careful to specify why this is so. Thus, to cite some illustrations, she suggests that lack of a behavioral model of the population has hindered the analysts' contribution to decision mak-

ing on income security, and that the state of research methodology has curtailed the potential benefits of experimental evaluation studies. Readers who are expert in the technology of cost-benefit analysis, evaluation research, and so on may feel her discussions are both elementary and simplistic. But one must keep in mind that the volume is based on a set of public lectures.

My major criticism is Dr. Rivlin's stance in the volume. I think she sees the policy researcher far too much as a passive technician, rather than as a change agent who initiates and promotes modification in government programs and policies. True, better behavior models, more elegant methodological designs and more efficiency in the conduct of research would help. But not as much, to my mind, as would smarter people who are politically sensitive and who possess intense zeal and ambition to improve the quality of life. In brief, Alice Rivlin is not emphatic enough about the importance of the very characteristics that underlie her own successful participation in government: Technical astuteness and basic social science knowledge are important but the millennium demands analysts with a special posture, a strong point of view, and a vigorous insistence on rationality.

HOWARD E. FREEMAN

Brandeis University and Russell Sage Foundation

Organizational Growth Through Decisionmaking: A Computer-Based Experiment in Educative Method. By Beatrice K. Rome and Sydney C. Rome. (New York: American Elsevier Publishing Co., 1971. Pp. xiv, 242. \$15.00.)

The authors call the empirical work that forms the core of their book an "experiment," but I have some reservations about that description. What they report are their observations on a single group of 24 subjects who, for a period of three months, operated a very elaborate computer simulation of an organization rather than a real one. The "experimenters" took a role in the simulation as a supervising authority to which the subjects were subordinate. Without ever appearing personally, they used their position in the simulation to send down directives which they hoped would promote the development of organization. They also engaged in manipulations of the computer program which were not divulged to the people operating the organization it simulated. They were, in sum, considerably more influential than is usual among participant observers. While it is true that they exercised a degree of

control usually identified with experimentation, they did not have either a commitment to the repeated observation of certain fixed or systematically varying conditions or a systematic basis for deciding how and when to intervene in their subjects' patterns of behavior. "Experiment" does not, therefore, give an entirely correct impression of the study they report. They grew their test-tube organization not with the purpose of testing the validity of existing ideas but with the hope of stimulating in themselves new insights into the development among a set of individuals of the property of being organized. The results do not appear to me to justify either the tremendous cost of the study or their years of effort in executing and analyzing the "experiment."

From scattered remarks in the book I would estimate that ten to twelve man-years and perhaps a year of computer time have been invested in this project. (There are six man-years—24 graduate students for three months each—in subject time alone.) Nonetheless, the authors provide only very sketchy information on their programs and procedures and no indication that such material can be found in other documents. This makes the book of little use to those interested in employing simulations in the study of organizational behavior. Nor is the book a contribution to the ongoing development of the body of organizational scholarship. No major work of any theorist of organizations or bureaucracy is discussed or even cited.

Such shortcomings might be tolerable in a book that was dense with interesting ideas, but *Organizational Growth Through Decisionmaking* is not. It does begin with an interesting question: Assuming that organization develops gradually rather than appearing full-blown, what are the constituent elements or relationships which being organized entails, and is there some sequence in which they are most likely to be observed? Unfortunately, neither their exploration of this question nor their proposed answers are at all profound.

All but the first 36 and last 18 pages of their text are devoted simply to recounting the history of their laboratory group's growth and activity. The Romes promise to show that each of the 44 "developments" they describe is distinct from the others, is universal in character, and occupies a necessary position in the unfolding of a logical sequence of stages. But all they actually deliver is a summarizing sentence or two at the close of their detailed factual description of each "development." These remarks are generally little more than common-sense restatements of what has happened (e.g., Development

20—"The subjects here demonstrated a competence to discriminate between technical action and action to execute policy and a competence to translate this discrimination into deed" [p. 131]). They do not provide good reasons—often they provide no reasons at all—for believing that each described development represents a single coherent stage of growth, likely to occur in most organizations, and likely to occur in a particular ordinal relation to other stages of growth. Yet in the conclusion of the book this is what the authors assert they have shown.

In fact, given certain disturbing features of their research, there are compelling reasons to believe that many of the events they report are not likely to occur in the order they observed—or even to occur at all. Although the Romes stress, as most of us would, that people organize to pursue purposes, they deliberately refused to specify for the subjects what was to be achieved in the operation of the organization. Since the Romes took the role of an unseen superordinate body sending down orders to the laboratory group and evaluating its performance, the subjects were left to guess what the experimenters wanted them to do. The relevance of the resulting behavior to a typical organization thus seems questionable.

Such doubts are reinforced by a number of additional facts. The organization which the subjects were to run was so complicated that even after months of operation "... the task of servicing the entire input load [was] too difficult for the group to solve . . ." (p. 185). Moreover, the experimenters appear to have been blind, if not cruel, in their reaction to the subjects' mounting frustration. The Romes report, with satisfaction, that the second leader of the group did not act on his expressed desire to "sabotage" the whole simulation. They never ask why he felt that way. They quote, without any apparent sense of its peculiarity, the following exchange of messages with the group leader: "You're working us too hard. You want blood or something?" Our reply, "Yes, indeed," was not further acknowledged by him" (p. 195). They see nothing requiring explanation in the subjects' references to their superordinate body as "Big Brother," as being "unreasonable" and "incomprehensible," and as having "an authority complex." Eventually the subjects held a private meeting to reorganize the group's leadership. During that meeting they refused to admit any nonsubject personnel, they made no notes, and they turned off the experimenters' tape recorder. The Romes, who amassed 11,000 recorded messages during this study, thus got no data on its single most

important event. Somehow they were unable to recognize that this was an act of rebellion against them *as experimenters* rather than against the role position they were enacting in the simulation. They blandly report the whole incident as another of their universal stages of organizational growth—"Asserting Administrative Autonomy (Development 33)." The effect is rather like reading an episode from the asylum of *One Flew Over the Cuckoo's Nest* retold from the point of view of Big Nurse.

Taken together, the absence of scholarship, the poor research design, weak intellectual work, and inhumane treatment of subjects provide reasons for rejecting virtually everything in the book except its guiding question. Financial responsibility rests with the Systems Development Corporation and the Air Force Office of Scientific Research.

MICHAEL D. COHEN

Stanford University

The Sociology of Progress. By Leslie Sklair. (New York: Humanities Press, 1970. Pp. 287. \$10.00.)

On the face of it, this is a very annoying book. The young author publishes here a revised version of his doctoral thesis at the University of London, serving as an object lesson on all the ills of behavioral sciences. His central thesis is based on a definition he introduces—the difference between innovational and noninnovational progress. If we take the author at his word, the difference makes no sense because progress is defined as "the end point, temporary or permanent, of any social action that leads from a less to a more satisfactory solution of the problems of man in society" (p. xiv). Innovational progress is explained to be what we knew to be progress all the time—"progress by means of the production of new things, ideas and processes" to which the phrase "with maximum impact on society" (p. xiv) is added, though after reading the book I still do not know what this means. Noninnovational progress is achieved by "maintenance and diffusion of the familiar things, ideas, and processes" but the author is loathe to leave well enough alone and adds "with minimal impact on society" (p. xiv). Now aside from arbitrarily reducing here four possibilities to two (i.e., maximal maintenance and minimal innovations), as noninnovational progress hardly qualifies by the author's definition, he asks how can you improve an existing human society and have minimal impact on it?

I dwell on these twin concepts because Professor Sklair reminds us several times that they are "the crux of the matter." He then proceeds

with a poor man's Parsons tour de force of showing us how Rousseau, Comte, Ellul, Marx, Weber, and several others all were struggling to reach his distinction but did not quite make it. In the process he succeeds in making several scores of generalizations about man, history, society, theory, ethics, and their relations to each other.

Nevertheless, this is a far from trivial book. It deals, in its tortured way, with one of the core issues of the era. It asks, in effect, is it not time we cease to identify progress with the inventions science and terminology continuously foist upon us while disregarding achievements in other areas, from greater humanization to evolution of more responsive institutions? While the perspective is hardly novel, we must note that the book was published in 1970 and written as a dissertation before the need to worry about noninstrumental progress was popular. If Sklair succeeds in introducing this notion into behavioral theories, often a few steps behind the spirit of the times, his ink will have been well expended.

The second part of his volume also indicates his heart is in the right place; he boldly favors a "sociological ethics," a morality which draws and builds on the findings and conclusions of the study of society, man's needs, and aspirations. His ethics are based, first, on the assumption that the survival of human society, is morally worthwhile and that social justice is "on balance the most satisfactory basis of social organization" (p. 197). While I must admit to being somewhat annoyed that the author ignores 80 pages I devoted to the same issue in *The Active Society*, he clearly produces some important insights. Thus he breaks out of the sterile dichotomy that behavioral sciences must be either scientific or a basis for value judgments, by suggesting that universal human needs, which can be ascertained empirically could and should guide our decisions. And he ties his sociological ethics to his theory by reminding us that man's needs include many which only "noninnovational progress" could provide for.

The book is richer than this review reflects because I focused on its main thesis, and much of its value is to be found in numerous scholarly asides about various theorists of progress and sociological theorists which preceded Sklair. I expect that with his homing instinct for "relevant" and macroscopic issues well developed and with his command of the field, Sklair will be heard of and deserves to be heard.

Columbia University and Center for Policy Research

Reinhold Niebuhr: Prophet to Politicians. By Ronald H. Stone. (Nashville, Tennessee: Abingdon Press, 1972. Pp. 272. \$8.00.)

Ronald H. Stone, a former student of Reinhold Niebuhr's and currently Associate Professor of Social Ethics at Pittsburg Theological Seminary, has written a very helpful "intellectual biography" of Reinhold Niebuhr (d. 1971), one of this century's major theologians (although Niebuhr disclaimed the title of theologian), ethicists, and political philosophers. Conceding that Niebuhr's thought can be analyzed from several interwoven perspectives, e.g., theology, ethics or political philosophy, Stone concentrates on the latter, attempting to "correct onesided theological interpretations . . . without committing the error of reducing his theology to the level of politics" (p. 9). Stone's corrective to other interpretations of Niebuhr's politics is to recognize that there is no central doctrine from which the remainder of Niebuhr's thought is derived and to emphasize the importance of a chronological study, not only because Niebuhr's writings reflect a tension between immediate political situations and reflection but also because his thought evolved over time. Stone identifies four major periods in this evolving political philosophy: the liberal, the socialist, the Christian realist, and the pragmatic-liberal. He does not deny the continuities and the presence of some elements, often implicitly, prior to their full development, but he does think that

each phase is characterized by the movement of certain concepts of political philosophy from the periphery of his thought to the center, by a solution to the ideal-real issue which differs from the solution of the preceding period, and by Niebuhr's recognition that his thought in this phase is significantly different from his thought in the preceding period (pp. 10-11).

One continuous thread is Niebuhr's relationship, both positive and negative, with liberalism, which he criticized from Marxist and theological perspectives before he rediscovered and reappropriated it. Another important thread is the basic question of Niebuhr's political philosophy: the relation of man's imaginary communities to his actual communities.

After a chapter which sketches Niebuhr's early years, the book covers the main periods mentioned above and then turns to a fuller analysis of his view of foreign policy since World War II. In the sphere of foreign policy, Stone emphasizes both the influence and general adequacy of Niebuhr's political realism; but he also moves beyond exposition to indicate some weaknesses, for example, the need for a closer relationship between morality and poli-

tics, for a more careful analysis of terms than Niebuhr provided, and for case studies of decision making.

The concluding chapter, entitled "The Relevance of Faith," deals with Niebuhr's social ethics in relation to faith. Stone contends that although Protestant social ethics "cannot remain content with all of Niebuhr's answers, he quite consistently asked the right questions" (p. 231).

Although many readers will want more detailed studies of particular aspects of Niebuhr's thought, including its relation to other patterns of reflection, and will make harder and perhaps deeper criticisms of his thought, they will find in this volume a sound and valuable overview, by no means uncritical, of his intellectual odyssey. In addition to its value for the scholar, the book should also be very useful to students coming to Niebuhr for the first time.

JAMES F. CHILDRESS

University of Virginia

The Logic of Science in Sociology. By Walter L. Wallace. (Aldine Publishing Company, 1971. Pp. 139. \$6.00.)

In this extremely compact book, Walter Wallace lays out the ingredients of the scientific enterprise. He reviews the main components of science—observations, empirical generalizations, hypotheses, theories, and the rest—in a very lucid manner. In addition, by using an ingenious map that sets these components in relation to one another (figure 1, p. 18), he is able to trace the complex interactions among them. Most of the text consists of a recitation of the norms to be observed in measuring, developing propositions, constructing theories, and testing. Though abstract, the book is exceptionally clear for the most part; it is an ideal theoretical-methodological primer that might well be assigned reading for the first week or two of first-year graduate courses in both theory and research methods.

The work is scarcely original. It relies heavily, and by and large uncritically, on the received wisdom of theoretical methodologists such as Blalock, Braithwaite, Kaplan, Merton, Nagel, Popper, Wartovsky, and Zetterberg. Nevertheless, Wallace is so skillful in selecting from and synthesizing the ideas of these men that the volume, despite its unoriginality, stands as a useful and unencumbered exposition of the essentials of the scientific method.

One of the strongest features of the book is Wallace's insistence on the distinction between (a) the standards by which a theory is to be assessed, and (b) the biographical experience

of the scientist. Thus, on pp. 16–17, he summarizes the basic relations among the components of scientific knowledge (for example, between empirical generalizations and theory) but quickly adds that, in the scientist's experience, there are a variety of ways of arriving at these relations—by lucky guesses, by formal derivation, by trial and error, by teamwork, and so on. Many discussions of science are obscured by the mistaken assumption that the specification of the norms by which scientific knowledge is evaluated constitutes an idealized description of a scientist's behavior. Wallace does not fall into that error.

Early in the first chapter, Wallace, following Montague, distinguishes among the authoritarian, mystical, logico-rational, and scientific modes of testing the truth of statements. In particular, he indicates that the logico-rational model depends on the "rules of formal logic," whereas the scientific mode depends on "the observational effects of the statements in question with a secondary reliance on the procedures (methods) used to generate them" (pp. 12–13). This distinction between "logico-rational" and "scientific" later turns out to be somewhat misleading, because in his subsequent discussion of theory, Wallace repeatedly stresses criteria of logical structure as important in assessing the *scientific* adequacy of knowledge. The distinction between logical and observational criteria for truth is a valuable one, to be sure, but Wallace should have avoided any implied identification of the scientific method more or less exclusively with the latter.

Wallace's discussion of empirical generalizations and prediction in science would have been improved by a discussion of the *conditional* character of most scientific knowledge. For example, in discussing the functions of scientific theories, he indicates that "theories can predict empirical generalizations that are still unknown" (p. 57). That formulation leaves something to be desired. It suggests that scientific theory generates generalizations that can then be discovered in nature. It seems to me, rather, that theories provide the investigator with a knowledge of the conditions under which empirical regularities may be expected. The empirical regularities may have been perfectly well known all along; it is their new significance that scientific theory underscores. Furthermore, these regularities may never have occurred empirically, as Wallace's quotation suggests; and if they have, then this may have been only in a laboratory under which the special conditions appropriate to the theory can be created. If

Wallace had considered the use of experimental and other types of controls in generating scientific knowledge, he would have strengthened his account of the nature of empirical generalizations and predictions.

In general, the exposition is carefully constructed and consistent. It is occasionally marred, however, by carelessness. As examples: (1) On p. 63 and again on p. 66 Wallace stresses that a scientific theory should be "non-tautological." He never explains or illustrates this criterion. Nor is the criterion self-evident. Certainly the scientific investigator should avoid making empirical statements that are true by definition rather than by observation; but at another level—the level of formal theoretical structure—there is a sense in which it is *desirable* that a theory be tautological, i.e., that derived propositions are simply different ways of stating the general conceptual relations in a theoretical structure. (2) On p. 78 he characterizes the statement "all human groups are stratified" as a hypothesis. Surely in that form it reads more like an empirical generalization, because any "if-then" relationship—which is characteristic of a hypothesis—appears to be lacking. (3) On p. 99 he speaks of "predicting and testing new observations." The terminology is odd; one predicts events and tests propositions, but according to linguistic convention, does neither for, but rather makes, observations. (4) The word "sociology" deserves little place in the title of the book. The bulk of the text concerns scientific discourse in general and presumably applies to all scientific disciplines; everything that is sociological about the book lies in the few concrete illustrations of general points made about the scientific method.

NEIL J. SMELSER

University of California, Berkeley

Historians on the Homefront: American Propagandists for the Great War. By George T. Blakey. (Lexington: The University Press of Kentucky, 1970. Pp. 168. \$7.00.)

In April 1917, shortly after the United States declared war on Germany, several historians met in Washington to discuss "what History men can do for their country now." The group, which included J. Franklin Jameson, Frederick Jackson Turner, and James T. Shotwell, decided that historians could put their special talents to good patriotic use. Though not every historian could shoulder a rifle, each could surely "aid in supplying the public with trustworthy information of historical or similar character." To facilitate this, Jameson and the others created the National Board for Histori-

cal Service. In addition, the Committee on Public Information and the National Security League recruited historians for essentially the same purpose.

In *Historians on the Homefront* George T. Blakey describes the activities of these organizations in considerable detail. His account, while narrow in focus, is clear, judicious and straightforward. It is based on extensive research not only in published sources, but also in the records of the National Board for Historical Service and the Committee for Public Information, and in the papers of historians who took part in the war mobilization. Not surprisingly, Blakey finds that historians "succumbed to the pressures of national bias and placed war aims above scholarly restraint," that "their propaganda work represented a severe break with scholarly historical standards" (pp. 104, 148). Blakey concludes that there is no way of reconciling the canons of scholarship with the demands of patriotic service.

Most of the book consists of an elaborate proof of this argument. The author devotes separate chapters to the historians' pamphleteering activities, public lecture tours, efforts at censorship, and attempts to persuade teachers to instill patriotism in the classroom. Various agencies distributed more than 33 million copies of pamphlets written by historians, most of which, Blakey holds, "reduced war issues to black and white, infused idealism and righteousness into America's role, and established German guilt with finality" (p. 52). Moreover, scholars vouched for the authenticity of most of the "Sisson Documents," which purportedly proved that the Bolsheviks were in league with the Germans but which were later exposed as fraudulent. Other historians suggested that public-school teachers could make the study of ancient times relevant to the world of 1917 by pointing out that "ancient Caesarism and imperialism are living forces in Germany today."

Yet Blakey points out that many historians, including some who contributed to the propaganda barrage, had serious doubts about what was happening. Professional historians, who had themselves rebelled against a school of amateur filiopietists, and who took pride in their commitment to scientific method, recognized the potential hazards in government service. One Wisconsin professor, for example, warned that making inaccurate historical analogies in order to stimulate patriotism would play "into the hands of the pseudo-historians." Still another scholar wrote his former mentor: "I have often wondered what you would think of this kind of work—propaganda work—whether a

scholar should do it or not." Andrew McLaughlin of the University of Chicago expressed a similar ambivalence: "Perhaps few of us are able entirely to disentangle our scientific historical fibres from our swelling patriotic muscles, but most of us can try."

In 1917 many scholars supposed such a feat was possible, but few would ever think so again. With the wave of revisionism in the 1920s, those who had echoed the wartime line of Allied innocence and German guilt came under fierce attack. One of the sharpest critics, Harry Elmer Barnes, had himself worked with the National Security League during the war, and might in part have been seeking "intellectual absolution for his propaganda sins" (p. 133). Blakey notes that historians did not repeat their mistakes during World War Two. Having once been burned, they became battle-shy. Indeed, Blakey finds in the World War One experience a warning for all who would combine scholarship with political activism: "The craft of history since 1918 has become a very delicate art, producing a durable commodity only when cultivated in a political vacuum" (p. 151). Surely not everyone will accept this view, but Blakey has shown that a strong case for detached scholarship can, in fact, be made by studying the classic case of involved scholarship.

The Role of the Military Professional in U.S. Foreign Policy. By Donald F. Bletz. (New York: Praeger Publishers, 1972. Pp. 338. \$16.50.)

It is usually fruitless to quibble about book titles, but the prospective reader of this volume should be warned that the title is misleading. It suggests that the book will reveal the part actually played by military officers in determining U.S. foreign policy, perhaps explaining how the Pentagon brass led us into Vietnam, for example. We do not find that kind of revelation here. The author is not concerned with showing us how military professionals have influenced the course of U.S. policy but with arguing that high-ranking officers in the Army, Navy, and Air Force should be trained to understand and appreciate the political factors in military decisions. Without saying so specifically, he implies that the days when a hard-fisted bomber pilot like General LeMay could rise to the highest level of responsibility in the U.S. government are gone for good. In the future we are more likely to see as members of the Joint Chiefs of Staff officers who have not only graduated from

the National War College but have also earned the Ph.D. in political science. In the meantime, it is refreshing to see a book by an Army colonel open with a quotation from Plato's *Republic*. Perhaps it is a sign of the times.

With the nation and its armed forces now going through a painful period of self-examination, serious studies of this sort by military officers should be welcomed by the academic community. Their shortcomings as seen by professors of political science ought not to be allowed to obscure their merits. An Army officer with thirty years of service in a wide range of assignments who is now conscientiously attempting to draw some conclusions from it all deserves to be listened to. The author entered the U.S. Army as a private during World War II and has now risen to the rank of colonel. The Army encouraged his educational interests and made it possible for him to attend civilian graduate schools. He is now on the faculty of the Army War College at Carlisle Barracks in Pennsylvania and is a Ph.D. candidate in international studies at American University.

Colonel Bletz begins his analysis with the observation that since World War II, military officers have been called upon more than ever before to deal with political problems. A new dimension has thus been added to military professionalism. Mere military proficiency is no longer enough—if it ever was. The overall objective of the volume is, in the author's words, "to examine in detail the extent to which the requirements of this new dimension have impacted on the military profession in order to make a valid judgment on the degree to which the national interest is being served and to recommend courses of action for the future" (pp. 8–9).

Much of what follows this statement of objectives is not of great interest to civilian readers, and much of it is already familiar to students of American military history and foreign policy. The major theme of the book is the development of the military profession (and military schools) from the days of the Indian wars to the Cold War era, with emphasis on the military officer's role in implementing national political decisions. The main problem we now face, as Colonel Bletz sees it, is how to give officers in the higher grades more training in the social sciences without diluting their military expertise. At the same time we need to organize the decision-making process of the federal government so that well-qualified military professionals can contribute to the process.

Colonel Bletz is greatly concerned that the "politico-military equation" be properly bal-

anced. By this he apparently means that both political and military factors must be taken into account in proper proportions when we determine national policy. Virtually no one would dispute such an obvious principle; it is in its application that the difficulty arises: What are the proper proportions of each element in the equation in specific situations? What were they in Vietnam, for example? The book does not shed much light on such matters.

As for Vietnam, Colonel Bletz concludes that at the lower level of military professionalism—strictly military expertise—the war was well fought. The weakness came at the higher level of professionalism—politico-military expertise. The military techniques used in Vietnam, we are told, were frequently inconsistent with the political objectives. The “politico-military-equation” was apparently not balanced. Unfortunately, we are not shown in specific terms just what the trouble was.

In the future, Colonel Bletz hopes, the political science now being studied in the military schools will have greater influence on policy. Future generals and admirals will have some understanding of political ideas. But the skeptical reviewer cannot help wondering *whose* political science will have influence. On Vietnam, for example, will we be guided by Hans Morgenthau or Robert A. Scalapino? Our speculation on that point comes to an abrupt end on page 265 when we read Colonel Bletz’s cautious conclusion that, “it is not the business of the professional military officer to make political decisions” nor even to make recommendations of a political nature. All he can do is “ask the relevant questions” and hope that the “politico-military equation” will somehow be balanced by the civilian authorities.

HARRY C. THOMSON

Silent Politics: Polls and the Awareness of Public Opinion. By Leo Bogart. (New York: John Wiley & Sons, 1972. Pp. 250. \$9.95.)

This book deals with a complex of important matters. There are in it a great many facts—more specifically, descriptive statements of processes, findings, and uses for political survey research in contemporary America. Moreover, one gets the feeling in reading the book that Bogart could, might, is just about to, bring it all together in the context of social-psychological and sociological theory and from the perspectives of the scholar-journalist that he is.

But he doesn’t.

So it turns out to be a book like most books, falling far short of greatness.

First, review-fashion, a word about content. The title is not especially helpful. The book is a series of essays on the uses to which political polling is and might be put, from the perspectives of candidates/incumbents, citizens (active and passive), and media managers. The dilemmas of leadership, participation, representation, and change processes are observed and commented on in various places through the twenty-one (for some reason unnumbered) chapters and eight “parts.” The first two parts and the last agitate the old questions of the place of commonpersons’ opinions in direct and representative democracies.

The middle five parts of the book deal with opinion change at both the individual and social levels. Many interesting facts and some provocative commentary are presented in chapter headings like “Changing One’s Mind,” “The Causes of Inconsistency,” “Opinion Under ‘Proletarian Dictatorship,’” and “Shocking Opinions.” But things fall apart. The middle does not hold—nor, for that matter, do the ends very well.

The book is strewn with insights and intellectually titillating assertions—that polling is *essentially* conservative (p. 60), that extreme views are valuable in a democracy because they expand the possible range of middle movement (p. 101), that anonymity and opinion-inconsistency are positively related (p. 132)—but they are hardly ever dealt with systematically or in context. On the positive side, however, the work is a cache of occasional information of journalistic and commercial poll data of a kind that someone like Bogart has access to but we in the more sheltered academic world do not.

Yet, as I say, the work doesn’t come off as a *work*. It is an unsatisfactory book because it doesn’t seem to have any design and because it’s not thorough enough. Bogart never makes clear what he’s trying to do in the book as a whole; he gives only a vague hint in the last paragraph of his preface. He never articulates his views about what the relationship should be between popular preferences and public policy. In places a kind of simple direct-democracy seems to underlie his views of democratic theory; but in other places he seems to understand that public policy is never static and therefore that even if we knew what to do today, we wouldn’t know what to do tomorrow, that survey research is a tool for leadership (a scalpel or a dull ax) and not a mandate, and that the media can also use opinion research in a variety of self-serving and other-serving ways. But these and many other critical matters are more alluded to than discussed. Examples there are

aplenty, but there is never any sustained commentary.

Bogart has not sorted out and clarified the level-of-analysis-problem. He moves carelessly from the individual to the social levels—even, on page 76, carried away, personifying opinion, saying “. . . it responds to drama, it heeds the appeals of respected leaders, it cringes at the prospect of disaster, it is bored by the repetitious and the inconclusive.” Again, there are lots of hints and examples of linkage between individual opinions (or processes) and aggregate opinions, but they are not tied together or put into any context. On a different but related matter, that of the pervasive publicness of political elites, his short chapter “Private Opinions and Public Roles” is rich with illustrations but has almost no analysis at all.

Finally, it's unclear for whom the book is written. For students and scholars, no doubt; also for journalists and media managers; and, one supposes, for the attentive citizenry who care about American democracy in practice. Because there are a lot of interesting facts, and examples of survey use/misuse, and because there are many intellectually-provocative one-liners, all three presumed audiences will find it of some worth; but because of its designlessness all three will also find it less than fully rewarding.

BERNARD HENNESSY

California State University, Hayward

The Party's Over: The Failure of Politics in America. By David S. Broder. (Harper & Row, 1971. Pp. 280. \$7.95.)

An able and liberal political journalist here joins the ranks of those alarmed by what they understand to be the declining health of the American polity. Broder assigns the responsibility mostly to an unresponsive and deteriorating political process, and offers as his chief remedy the reinvigoration of responsible party government. His writing, conveying honest anxiety and earnestness, nicely combines moderation of tone, constructive criticism, and gravity of content. But the ground traversed is by now excessively familiar, and the remedies proposed—though Broder is not optimistic about their realization—are from an earlier era and are neither well thought through nor clearly related to the ills diagnosed.

Our crisis, as seen by Broder, reflects not merely the severity of escalating unsolved problems but a loss of popular confidence in government, especially by blue-collar workers, minorities, and college students. This political malaise feeds on the failure of political parties

to perform in our time their historic function of clarification and unification for the citizenry: “The governmental system is not working because the political parties are not working” (p. xxiii). The reasons and/or symptoms include divided party government under Eisenhower and Nixon; constraints on presidential initiative stemming from narrow election victories, as with Kennedy in 1960 and Nixon in 1968; the personalized presidencies of Eisenhower and Johnson, each committed to different types of consensus politics hostile to effective party development; and increasing voter independency of party and willingness to split tickets. Above all, the pluralistically fragmented governmental structure and process, which gives some interests a persistent advantage, has failed to promote grappling with America's pressing problems.

The range and gravity of the crisis sketched by Broder contrasts strongly with the considerably narrower political process “causes” he emphasizes. Further, the process reforms advocated by Broder turn almost entirely on the notion of the political parties as “the instrument of national self-renewal” (p. xi). He endorses the thrust of the 1950 report of the APSA Committee on Political Parties, “Toward a More Responsible Two-Party System,” and in full awareness of its rejection by most political scientists. But Broder does a poor job, logically and empirically, in buttressing his preference, especially since he is fair in recognizing many of the durable and ongoing obstacles to party government in America.

Like many other commentators on the topic, Broder confuses reforms which strengthen presidential leadership with those which facilitate party government; the implicit assumption that the former must serve the latter is wrong. Similarly, developing party-based stronger collective leadership for Congress may or may not contribute to a more centralized and disciplined national party. As for Broder's enthusiasm (as of 1971) for the Democratic party's convention “reforms” as an important step toward greater party responsibility, it suggests not so much a flawed crystal ball (a common disability) as a meager understanding of what party government means and requires. In keeping with Broder's stubborn resistance to the conclusion that the times are increasingly unsupportive of the kind of tight, responsible two-party system he envisions as a panacea, he pays little attention to such decentralizing trends as separatism and community control.

Beyond the questionable consistency of major parts of Broder's prescriptions, there is the

larger problem of whether responsible parties could or would attend to resolving the major ills of the polity. Perhaps so, but Broder is better at asserting the linkage than at arguing or proving it. At bottom, then, the study is more successful in conveying a sense of alarm and urgency to readers about the necessity for change than in persuading them of the necessity, desirability, or feasibility of the particular process reforms urged by Broder.

ALLAN P. SINDLER

University of California, Berkeley

Critical Elections and the Mainsprings of American Politics. By Walter Dean Burnham. (New York: W. W. Norton & Company, Inc., 1970. Pp. xii, 210. \$6.50.)

This is a puzzling book. It starts off with regression-based discontinuity coefficients and t-tests applied to series of American election results, and it finishes with statements like the following, "The evidence points overwhelmingly to the conclusion that the American polity has entered the most profound turning point in its history" (p. 188).

I have read this book twice during the last two years, and while I am duly impressed and provoked by the conclusions, I must admit I still do not fully understand how Professor Burnham arrived at them. There are many statements in the book that suggest profound thinking about the relationship between democratic institutions, the social and economic order, and popular control of public policy. The empirical base derives largely from the analysis of aggregate voting patterns in the nation as a whole and in selected states and localities, as well as from some survey data on party identification. I do not so much find fault with the data analysis, which is often suggestive and insightful, as with the premises for the connections with Professor Burnham's overall conclusions.

Much of the book flies much closer to the ground than the author's concluding statements suggest. The first three chapters constitute a study of past realignments. Burnham begins by offering a definition of critical realignment, which he seems to mean as empirically derived from the common characteristics of previous examples. But unfortunately, his standards for the definition are not clear, and he makes no attempt to show systematically that the commonly recognized realignments had all or even most of these characteristics.

The closest he comes to relating a portion of his definition to empirical data on the past is in Chapter 2, "The Periodicity of American Crite-

cal Realignments"—periodicity being one of the elements of his definition. Here he applies the "discontinuity coefficient" in conjunction with a t-test to a series of national elections in order to identify critical realignment years; and finds that the midpoint years 1854, 1874, 1894, and 1930 stand out. He concludes that sure enough, with the exception of 1874, there is a striking periodicity in the data. He does comment on the marginal values of the coefficients for 1854 and on the very high values for 1874, but he does not make it clear whether we have discovered a new major realignment in 1874 or whether we have merely confirmed his observation about periodicity. It would have helped if he had indicated more clearly what his data were meant to show and if he had done comparable empirical studies of the other elements of his definition. Those who look to this book for a contextual treatment of the causes and consequences of past realignments will probably be disappointed. Yet this seems not to have been Burnham's intention, and he does have more to offer.

The remainder of the book is the most interesting part, in my judgment. Burnham discusses the rules changes and "systemic forces" of the "System of 1896" and their consequences in terms of reduced turnout and reduced partisanship. The rules changes were "devices by which a large and possibly dangerous mass electorate could be brought to heel and subjected to management and control within the political system appropriate to 'capitalist democracy' . . . a remarkable solution to the problem of adjusting mass politics to the exigencies of industrialism" (p. 90). This is a pregnant statement, and I am prepared to be convinced of its validity. The consequences of some of these changes for the political participation and power of the southern black are well known. Yet if Mr. Burnham has clear ideas on what these changes prevented the total electorate from doing to the capitalist system, or what the voters were prevented from doing for themselves, we would all be enlightened if he spelled them out.

"The Onward March of Party Decomposition" is traced, with some interesting tangents to changes in the nature of political campaigns and the institutionalization of the House of Representatives. Burnham does not know whether the decomposition of party is part of a pre-realignment process or whether it will make realignments as we have known them impossible in the future. He clearly finds the trend dangerous because parties are "the only devices thus far invented by the wit of Western man which with some effectiveness can generate

countervailing collective power on behalf of the many . . . powerless against the relatively few who are . . . powerful" (p. 133).

Burnham finds the foreseeable realignments almost as troubling as the continuing decomposition of party. Several possibilities seem to him to have "as large a civil war potential . . . as any critical realignment in our history" (p. 170). If this is the case, the absence of a crystallizing factor is doubtless fortunate, especially since "it is probable that any force great enough to produce 'classical' realignment under present conditions would also be great enough to break the system altogether, with consequences of incalculable magnitude" (p. 173). If the lack of party identification is to save us from such a realignment, the consequence may be the termination "of the historical role in reshaping our institutions and our political system which has been played by the American electorate from time to time" (p. 174). The book concludes with the observations that "a decisive triumph of the political right is more likely than not to emerge in the near future," or perhaps an *Obrigkeitstaat* along the lines of Imperial Germany (pp. 192-3).

This is a profound book, and whether he is right or wrong, Burnham has much to tell us. The book is like an iceberg, with much remaining below the surface. I wish the terms of the argument by which he arrives at his conclusions were clearer and lent themselves more easily to evaluation. On the other hand, when one contemplates the gravity of the conclusions, one can understand why he may have wanted to publish before all of the logical connections of his arguments were spelled out.

WILLIAM R. KEECH

at Chapel Hill*

Regional Economic Development: the Federal Role. By Gordon C. Cameron. (Washington, D.C.: Resources for the Future, Inc., 1970. Pp. 161. \$4.00.)

The Fiscal Organization of American Federalism. By Richard E. Wagner. (Chicago: Markham Publishing Company, 1971. Pp. 119. \$7.50.)

Although these two books have in common the subject of federalism and various policy issues of the United States federal system, they are so different that I shall discuss them separately.

Wagner's book is one of a number of recent technical economic studies devoted to the problems of collective choices respecting private

versus public goods, and types and amounts of public goods. The central problem is the familiar one of obtaining possible gratification of individual preferences in collective decisions. "If majority coalitions are wholly unconstrained, majority voting will tend to produce socially wasteful budgetary choices" (p. 13). The larger the governmental jurisdiction the greater the probability of budgetary inefficiencies. With no space to discuss the argument, I jump to several important conclusions:

(1) There should be greater flexibility to reshape subnational governmental jurisdictions. On efficiency grounds, "if a group of citizens within one state want to form a new state," . . . or, "if a group of citizens within an area incorporating parts of two or more states want to form a new state, they should be permitted to do so" (p. 64). For "the mere availability of the option of secession produces an equalization of bargaining power and protects against geographical discrimination" (p. 65). The propensity of wealthier citizens for forming enclaves to escape contributing to the support of poorer citizens can be overcome by making income redistribution primarily a national responsibility, which Wagner advocates.

(2) The more comprehensive the government and its budget, the lower the degree of taxpayer control; "consolidation diminishes taxpayer perception of changes in the price of any single budgetary component and increases the immunity of politicians to competitive pressures" (p. 53).

(3) Contrary to conventional wisdom, governmental consolidation within metropolitan areas therefore should be viewed with suspicion. Once the income redistribution function is taken over by the national government, budgetary efficiency becomes the main objective of local governmental organization, and in Wagner's view efficiency can be better attained by many smaller jurisdictions than by one or a few larger ones. Inefficiencies of small jurisdictions having to do with economies of scale and externalities can be handled by negotiation among jurisdictions or by contracting out.

(4) Of the various forms of federal grants, only unconditional grants satisfactorily meet efficiency tests. The prevailing multiplicity of conditional grants frustrates efficiency in many ways. As for block grants, "If revenue maintenance is not required, [they] are indistinguishable from unconditional grants. If revenue maintenance is effectively practiced, block grants degenerate into a particularly oppressive form of conditional grant" (p. 59).

These are provocative conclusions. It is not

deprecating Wagner's scholarship to say that many will disagree with much of their content, for much of the argument rests upon the primacy of individual preferences and decisions and a view of individuals as economic hominids, with the knowledge and inclination to follow the intricacies of making budgets, producing and delivering public goods. In the real world, most people pay little attention to local government and the processes of providing services other than to squawk when services fail.

Wagner falls into an error, common to economists, of assuming that small constituencies are better public decision makers than large. There is considerable evidence that in the real world, smaller jurisdictions, which according to American mythology are the representatives of democracy in its purest form, tend to be run by small cliques, to resist innovation, to have poor communications among constituents, to make decisions unsystematically, and otherwise fail to meet the conventional tests of "good government."

In short, while Wagner is well worth reading for a well-ordered presentation of one school of economic thought, many of his most important policy conclusions are infeasible and many, in this reviewer's opinion, are unsound. They are unsound not because of faulty reasoning but because of his premises, which reflect far too simple views of the nature of government and human beings and their relationships to society.

Cameron's study concentrates on the case for federal intervention specifically to raise employment and income in backward and lagging domestic areas. The backdrop is the Public Works and Development Act of 1965, the administrative issues created and left unresolved by that Act, and the subsequent operating experience of the Economic Development Administration (EDA) through 1969.

"Rapid national growth," says Cameron, "has not eradicated severe and persistent imbalances between the demand for labor and its supply in literally hundreds of small and medium-sized labor markets in every U.S. region" (p. 127). He lists four categories of areas: (1) rich labor-surplus areas in which massive immigration has caused labor market disequilibrium; (2) old industrial urbanized areas with ossified export structures; (3) rural areas still relatively productive, but with heavy unemployment caused by substitution of machinery or other technology for farm labor; (4) the chronically poor, unproductive and worked-out mining areas, characterized by low per capita income, often heavy unemployment, and large out-mi-

gration. The justification for federal action to relieve economically backward and distressed areas is that the federal government is the only instrument fiscally able to help them.

The need for assistance to at least the first three categories of lagging areas is clear enough, and clearly only the federal government can intervene effectively. Whether the federal government, given its own political and economic constraints, including serious knowledge gaps, can accomplish much is another, largely unanswered, question.

One of Cameron's major contributions is a thorough analysis of various alternative policy measures. He concludes that one of the most promising approaches is to concentrate resources on stimulating regional development centers—middle-sized cities which can be the nuclei for economic agglomeration. Concentrated investment is likely to have several advantages over the same amount of investment more spatially diffused over a region.

A second valuable contribution is the review of EDA policies and programs. Cameron gives the agency good marks, on the whole, for imagination and vigor. It was greatly handicapped by the necessity of placating congressmen by scattering its limited funds widely, and by the narrow range of its development activities.

I have two main criticisms of the study. First, the analysis is almost entirely abstract—of the "on the one hand this, and on the other hand that" variety, which demonstrates the complexity of formulating policies but does not lead to many firm conclusions. It offers few data and no illustrations or case studies. Cameron is highly respectful of the overwhelming power of "market forces," but doesn't adequately identify or analyze them. Much of the analysis appears implicitly to be based on manufacturing, though the author recognizes that manufacturing is now a slow-growth industry. There is little discussion of the implications for future regional development of current economic trends, particularly the rapid growth of tourist, vacation, retirement and other service industries. The case of Vermont (where this review is being written) illustrates how a state lacking resources and industry, but with the wisdom to preserve its environment, can evolve into an area of such great attractiveness that one of its principal concerns is deterring undesirable growth.

The second major criticism has to do with Cameron's failure to relate regional underdevelopment to the lack of any considered national policy respecting economic growth and the location of population and industry. As he

notes, some of the greatest problems have stemmed from federal behavior in encouraging the concentration of highly specialized centers (as in defense and aerospace industries) which are then devastated by shifts in federal priorities. One gathers that the federal decisional process is one of the main economic forces alluded to by Cameron, and that for reasons intrinsic to the federal establishment it is little better directed at reducing economic dislocation than are other economic forces.

LYLE C. FITCH

Institute of Public Administration, N.Y.

Lawyers Before the Warren Court: Civil Liberties and Civil Rights, 1957-66. By Jonathan D. Casper. (Urbana: University of Illinois Press, 1972. Pp. xi, 221. \$9.50.)

Jay Casper has written a fascinating book about lawyers in private practice who argued reapportionment, civil rights, criminal procedure, and loyalty-security cases decided by the Supreme Court with full opinion. He also provides an excellent concise review of the substance of litigation decided during the 1957-66 period of "activism and progress," the dominant trend of which was "toward equality and freedom" (pp. 18, 19), showing the Court's spotty record in the loyalty-security field and its unwillingness to go beyond narrow grounds in the sit-in cases, as well as its better-known criminal procedure shift from case-by-case to broad rule. Substance and process are joined in another theme, the conjunction between participants' goals and policy adopted, with contrasts between narrow grounds urged and broad policy adopted in criminal procedure, and broad, multiple grounds urged and narrow decisions handed down in the sit-in cases. The Court's role as a conflict-generating institution is also stressed: the Court opens or reopens issues for others, setting their agenda and refusing to let them avoid issues.

Casper is principally concerned with a lawyer's *clientele*, the group or interest a lawyer perceives himself as serving (his most salient reference group); this clientele may or may not be his particular client and may not be involved in the case at all. Agreeing with this choice of concept, I think he too quickly dismisses *role* as an alternative concept because it is undifferentiated. One could ask whether a lawyer representing a group was expected by relevant others to behave differently from one interested in representing only a specific client, important, given the controversy over NAACP and ACLU priorities in representation of individual clients.

Casper's categories are the Advocate, inter-

ested primarily in his particular client and in short-term considerations; Group Advocate, focusing on a particular group over the longer term; and Civil Libertarian, interested in broad, enduring social principles. Because the categories seem to be established from lawyers' goals, the author stresses that, although empirically related, (reported) goals and social interests served are conceptually distinct. Casper also distinguishes between lawyers' views on the roles of law (conflict-resolution and social control versus social change and sustaining democracy) and the bar (passive or active). Most lawyers either believe in law as a resolver of conflict and a passive bar (Traditionalists) or in law as a force for social change and active bar (Reformers). Most Advocates are Traditionalists, while Group Advocates and Civil Libertarians are mostly Reformers. The author makes good use of analysis of those who do not fit this pattern. Thus we see that several black civil rights lawyers were Traditionalists and that the experienced criminal lawyer may get interested in recurring issues *qua* issues even though he doesn't have a commitment to his clients. We also find out about the effect of ideology in the choice of career pattern, the question of who will be appointed in criminal cases, and about members of the Radical Bar and lawyer-politicians in reapportionment cases.

Areas of litigation differ in recruitment patterns and lawyer types. Lawyers in criminal procedure cases, predominantly Advocates, entered a case by court appointment at various stages of the case. Most lawyers arguing reapportionment and loyalty-security cases, Group Advocates or Civil Libertarians, were involved from the initial trial; one-third of the civil rights case lawyers did not enter until the Supreme Court level. Because of their ideology and the Court's stress at the time on both the facts of a case and the "totality of circumstances," Advocates generally argued technical grounds. This was reinforced by their clients' high personal stakes—long prison sentences or death. Advocates argued broad points to win cases, not because they wanted the policy; thus the Court's broad criminal policy was an unintended by-product of the Advocates' goals, reminding us not to infer motives from results.

The Group Advocate, perceiving in "we-they" terms, had personal, ideological, and institutional contacts with his clients, resulting in a personal commitment to them not shared by the Advocate and Civil Libertarian vis-à-vis their clients. Lawyers entered reapportionment and loyalty-security litigation primarily through friendship; they entered civil rights cases

mostly through group contacts. In the early loyalty-security cases, Radical Bar lawyers had both personal and ideological ties to their clients; the Civil Libertarians who took the later and safer loyalty oath cases had neither. Group Advocates, ambivalent about grounds to raise, may, as in the reapportionment cases, use broad ones for pragmatic reasons, but Civil Libertarians would be interested in them for abstract reasons. Casper also suggests that Group Advocates can be counted on in times of repression, whereas Civil Libertarians may be "fair weather friends."

Most of the cases Casper's lawyers argued were decided before a development attributable in large measure to decisions like *Gideon*: the recent substantial growth of public defender offices, which Casper suggests will produce more lawyers concerned about general problems of the disadvantaged. Yet one wonders. Institutional demands on public defenders can blunt their idealism and lead to increased plea-bargaining, "package dealing," and indifference to clients. In his balanced speculation, Casper recognizes that these results may occur at the trial level, but he suggests that frequency of involvement with issues might lead to stressing broader policy matters and that appellate public defender divisions would be more inclined to raise the large issues.

In this volume, in which one needs to look hard for something to criticize, Casper has given us an important addition to our knowledge about the lawyers' role in the policy process, and, because of the "clientele" focus, a contribution to the group theory of the legal process. Because of the study's importance and the questions it raises, it is sometimes difficult to keep in mind that only the Supreme Court is covered. What we now need is a replication for the post-1966 period and interviews both of Casper's respondents about other cases and of lawyers who petitioned for *certiorari* but were unsuccessful in getting to oral argument before the high court.

Southern Illinois University at Carbondale

Participation in American Politics: The Dynamics of Agenda-Building. By Roger Cobb and Charles Elder. (Boston: Allyn and Bacon, Inc., 1972. Pp. 182. \$3.50.)

Political scientists frequently use but rarely study the concept of the political agenda. While notions such as gatekeeping, demands, mobilization of bias, and nondecision making are familiar conceptual wares, the explicit questions of how and when problems gain agenda status

have, for the most part, not been treated systematically. Roger Cobb and Charles Elder offer an introductory framework and a useful perspective on how problems become political issues and assume their place on the political agenda. The two political scientists critically evaluate system, power, decision making, and group approaches, and then they construct their own group conflict paradigm of agenda building. Though the paradigm is probably of only modest value, Cobb and Elder successfully sort out, define, and examine many of the important questions about agenda building.

Perhaps most noteworthy is their distinction between two basic types of political agendas—systemic and institutional. The systemic agenda refers to issues that are defined by members of a political community as warranting government action. Cobb and Elder suggest three prerequisites for issue access: (1) widespread attention or at least awareness; (2) view that action is required; and (3) view that action is appropriate for government. The institutional (or formal) agenda consists of those sets of items that are explicitly up for consideration before a governmental body.

After reviewing four major approaches to agenda building as noted, Cobb and Elder, adopt a group conflict approach, which hypothesizes that political issues result from procedural or substantive conflicts between two or more identifiable groups for either scarce resources or scarce positions. And borrowing heavily on Coleman and Schattschneider, the authors view conflict as a dynamic process.

Cobb and Elder distinguish five characteristics of issues that influence their likelihood of reaching the public docket. Adapting Parsons's pattern variables, they focus their definitional dimensions on the nature of the issue conflict. They point to the scale of groups—organizational skills, extensity and intensity of communications, size, resources—as of major importance in issue expansion. In addition, they elaborate major roles the audience can play in the expansion of issue conflicts.

Cobb and Elder devote several chapters to issue expansion. Their basic position is that "the greater the size of the audience to which an issue can be enlarged, the greater likelihood that it will attain systemic agenda standing and thus access to a formal agenda" (p. 110). They discuss the types of symbols used to enlarge the scope of a conflict and the crucial role played by mass media in terms of various strategies to enlarge controversy and muster support.

Cobb and Elder do not foreclose inquiry into agenda-building. Their general paradigm, while

suggestive, is largely a catalogue of possible ways in which a problem may become a political issue. Few research studies are cited. While one chapter is devoted to case examples, it is primarily discursive and reportorial—and probably the book's most unsatisfactory chapter. As the authors recognize, the framework lacks "systemic elaboration and rigorous empirical inquiry" (p. viii). The paradigm offers ideas and hypotheses rather than ready-made explanations or research designs. Also, the exclusive focus on group conflict raises many of the familiar criticisms of omission often leveled against "group theory"—the failure to recognize, for instance, the role and importance of other political forces such as the executive, legislature, bureaucracy, and political parties.

The analysis of Cobb and Elder primarily centers on how issues achieve systemic agenda standing. But because they do not delineate or propose measurement methods, it is not clear how students of agenda building can operationally distinguish among systemic issues. As Charles Jones points out, many problems—e.g., race or education—are highly interrelated and represent a "bundle of actual problems." And in my view, rather than suffering from a lack of access, the systemic agenda seems to be overcrowded with issues. Cobb and Elder acknowledge that recognition on a party platform is indicative of an issue's having attained standing on the systemic agenda. If so, the 1972 Democratic and Republican platforms provide ample evidence of our bountiful systemic concerns. Moreover, television has transformed the living room into a public arena, introducing the viewer to an overwhelming number and variety of systemic issues. Attention to agenda building should perhaps focus more heavily on the formal agenda and the influences on the range and types of policy alternatives for issues considered by "authoritative decision makers."

The exclusive focus on group conflict means that other major sources of agenda issues are not examined. For one, the mass media are more than passive intermediaries for the interplay of interest groups. As Murray Edelman suggests in *The Symbolic Uses of Politics*, politics for most of us is a "passing parade of symbols." The mass media play a pivotal role in selecting, highlighting, and developing the symbols of politics as well as acting as "fourth branch of government" brokers for public and private decision-making groups. And second, government bureaucracies are a primary source for agenda items, systemic as well as institutional. These two examples underscore the conclusion that interest-group conflict is only one

approach to agenda building; others such as general systems and decision making may offer equally useful paradigms for how problems become public issues.

Despite shortcomings, Cobb and Elder have written an excellent overview of agenda building. Examining questions largely neglected, the book should be a notable stimulus to explanations and research on the "dynamics of agenda building." It should be read with particular interest by students of public opinion and participation.

RONALD O. LOVERIDGE

University of California, Riverside

The Apportionment Cases. By Richard C. Cortner. (Knoxville: University of Tennessee Press, 1970. Pp. xii, 283. \$10.95.)

Reapportionment: Law, Politics, Computers.

By Terry B. O'Rourke. (Washington: American Enterprise Institute for Public Policy Research, 1972. Pp. 111. \$2.00, paper.)

It seems the fate of movements for reform in American government to be oversold. Perhaps this tendency can be traced from Henry George's single tax, through Bryan's free coinage of silver, to the "reapportionment revolution." But reapportionment is different, for the reform was adopted, and early results are in. Some judgments can be made. One remembers in wonderment the excitement of the middle 1960s, when the National Municipal League rushed to publish reapportionment decisions made by the most obscure courts. The Supreme Court had spoken, and "one man, one vote" in the state legislatures was the first step toward urban salvation.

These two volumes are based on different assumptions and written from different historical perspectives. Their purposes and formats contrast sharply. Yet they complement each other. Professor Cortner uses the term "revolution" approvingly; he is confident that the one man, one vote standard is a landmark in the continuing definition of the constitutional right of equality, and his book tells much of how it came to pass. Terry O'Rourke's voice is that of disillusionment. The Court's rigid mathematical standard has, he feels, created more problems than it solved. In particular, it facilitates "vastly more sophisticated" gerrymanders. Treating representation as involving an individual right—the right to cast a vote that is "undiluted"—the Court is precluded from considering the essence of representation, which deals with the influence of groups and parties.

The title of Professor Cortner's book is

somewhat misleading. Rather than encompassing the total development of case law in the field, he is largely concerned with two landmark decisions. *Baker v. Carr* was the Tennessee case which, in 1962, held that legislative apportionment is a justiciable matter setting aside the "political questions" doctrine of *Colegrove v. Green*. In 1964, the Court chose the Alabama case of *Reynolds v. Sims* as the vehicle for enunciating the one man, one vote standard.

Cortner is interested in the genesis of the cases, the personalities of those who argued and decided them, the routes followed through courts of appeal, the arguments made in briefs, and the technicalities cited to distinguish a particular case from previous ones which established an unfavorable precedent. Cortner recounts such details for these two cases in leisurely but lucid prose. In the process, he tells us a great deal about the politics of Tennessee and Alabama, and we perceive the evil for which a judicial remedy was sought through the eyes of the original litigants. The constitutions of both states provide for periodic, population-based apportionments; both had been last apportioned in 1901. Rotten boroughs had become absolutely fetid. Sixty years and federal court intervention were required before the two legislatures performed their unpleasant, but constitutional, duty.

It is this sense of the *status quo ante* that is missing from O'Rourke's volume. In commenting on the cases, he emphasizes dissenting remarks that prophesy the difficulties now being experienced with the one-man, one-vote standard, which he describes as a "facile and question-begging premise" (p. 16). While O'Rourke's analysis is largely an exercise in hindsight, Cortner's is remarkable for its uncritical praise of the "revolution." Although published in 1970, the book barely notes developments since 1964. Cortner's historical account of the Tennessee and Alabama cases is carefully researched, including extensive interviews with the litigants and their attorneys. Any future scholar interested in these two cases will perforce need to acquaint himself with Cortner's volume. As if to emphasize the book's status, the note describing its type face reports that "the paper on which the book is printed is designed for an effective life of at least three hundred years."

Cortner's final chapter is an able analysis of the conditions under which the Supreme Court may successfully make policy. He compares the apportionment cases, in which the Court was successful, with the desegregation and school

prayer cases, in which the Court's policy depends too much for implementation upon non-judicial actors. This chapter stands alone, for it depends only marginally on the account of *Baker* and *Reynolds* that has gone before. It is recommended as a succinct account of the possibilities and limitations of the Court's role in American politics.

Published as one of the "Domestic Affairs Studies" of the American Enterprise Institute for Public Policy Research, Terry O'Rourke's paperback volume has a slight air of impermanence. Basically, it is a status report upon a still developing issue. It consists of three independent chapters that are logically and chronologically related but lead their author to no general conclusions. In the first chapter, the author describes the *Colegrove*, *Baker*, and *Reynolds* decisions. He next describes the narrowing of the judicial standard to rigid arithmetical equality in 1967 and 1969 and its application to 80,000 units of local government in *Avery v. Midland County*. The author concludes the chapter by suggesting that the Court's treatment of the issue probably precludes it from affording relief to litigants who claim their political influence has been diluted by partisan gerrymandering.

The second chapter describes the political reaction to the *Reynolds* decision, including the abortive Dirksen Amendment and the equally abortive effort of state governments to call a constitutional convention. Then he considers the impact of legislative redistricting upon state governments and finds that the prediction of urban benefits has fallen far short of the mark. Reapportionment enthusiasts oversold their remedy, and, by the time it went into effect, the suburbs, rather than the central cities, were often the beneficiaries. He summarizes research by Dye, Dege, Friedman, Hofferbert, and others, which indicates that the quality of its legislative apportionment is not the only, or even a very important, determinant of the quality of a state's government. He concludes with figures for thirteen large, politically competitive states which demonstrate that the gerrymander is alive and well.

The first two chapters each end by setting the stage for the third, which sketches the history of the use of computers to outline proposed district boundaries, and provides a case study of their use in California. O'Rourke demonstrates—if there was any lingering doubt—that, with the aid of computers, it is a simple matter to draw district boundaries that are absolutely equal in population yet implement flagrant partisan gerrymanders. This can be done even while rendering districts that may be compact

and contiguous and respect local government boundaries. The Republican computer in California was particularly cleverly programmed in 1970.

O'Rourke's book is brief, well written, and hard-hitting. Hardly a definitive account of the reapportionment controversy, it does provide an admirable introduction to the current state of play on the issue. The moral garnered from reading these two books together is that, if we insist on calling the federal court decisions on reapportionment a "revolution," we will be charged by our students with a credibility gap.

KARL A. LAMB

University of California, Santa Cruz

Constitutional Law and Politics, Three Arizona Cases. By Richard C. Cortner and Clifford M. Lytle. (The Institute of Government Research: "Arizona Government Series," 9; Tucson, Arizona: University of Arizona Press, 1971. Pp. 137. \$3.00, paper.)

The Arizona Train Limit Case, Southern Pacific vs. Arizona. By Richard C. Cortner. (The Institute of Government Research: "Arizona Government Studies," 8; Tucson, Arizona: University of Arizona Press, 1970. Pp. 47. \$1.50, paper.)

Great constitutional cases do not arise in a political vacuum, nor is their importance limited to a few principles of law. While political scientists have employed the case study as a device to demonstrate the political functions of the judicial process, there remain too few in-depth analyses of major litigation from the initiation to the impact stage. Political scientists at the University of Arizona currently are mining these raw materials from the political history of their state. The Institute of Government Research is publishing a series of short paperback volumes, each a case study of a major event in the state's history. While these volumes will be of interest to those concerned with interest groups, legislative behavior, and public administration, the two recent volumes commented upon here will be of particular value to scholars and to teachers of constitutional law.

In *Constitutional Law and Politics, Three Arizona Cases*, Cortner and Lytle examine three major civil liberties cases: the *Miranda* case setting guidelines for police interrogation, the *Gault* case attacking problems in the administration of juvenile justice, and the litigation involving the Arizona Loyalty Oath, *Elfbrandt v. Russell*. The authors introduce the legal and political background of each case early, following it by a discussion of how and why

litigation was initiated. They turn next to the strategies and techniques of litigants and attorneys and typically include an encapsulization of the major arguments submitted in briefs before the Supreme Court. The text of the decision is set out—at some length—followed by a brief epilogue.

Although the authors contribute little to our knowledge of *Miranda v. Arizona* (384 U.S. 436 [1966]), the discussion of *In re Gault* (387 U.S. 1 [1967]) is more valuable. *Gault* was the second major step taken by the High Court to reform the nation's juvenile court system. The description of what happened to fifteen-year-old Gault highlights the inadequacies of the system. Of interest is the depiction of how Gault's attorney established a record at the habeas corpus hearing which proved decisive upon review, as well as the discussion of the unimaginative, narrow, and formula-ridden handling of the case by the Arizona courts.

The emotional and practical drain of being the central figures in a major civil liberties test case is illustrated in the story of the Arizona Loyalty Oath Case (384 U.S. 11 [1966]). Of thousands of state employees, only six refused to sign the oath. The Elfbrandts alone saw the case through, having to support themselves during five years of unemployment and seeing that the litigation was subsidized.

Perhaps the most interesting of these studies and the most adaptable for teaching purposes, is the short volume on the train limit case, *Southern Pacific v. Arizona* (325 U.S. 761 [1945]). Professor Cortner lucidly describes the legislative history of the statute, the interest of the Railway Brotherhood in preserving it, the interest of the railroads in voiding it, and gives sufficient information to understand the problems of safety. He describes the many stages of the sixteen years of litigation and provides sufficient data to make comprehensible the relationship of the Arizona litigation to changes in the railroad industry and to litigation in three other states.

These studies, which read easily, are useful for supplementary reading in courses on the Supreme Court, judicial process, and—especially—constitutional law; these courses traditionally have focused too much upon the Supreme Court and upon the dissection of abstract principles and judicial logic at the expense of an understanding of the interrelationship between the courts and other actors of the political system in the constitutional process. (Teachers interested in a casebook integrating the case method with case studies, are referred to the same authors' *Modern Constitutional*

Law, Commentaries and Case Studies [New York: The Free Press, 1971].)

While the Arizona studies are useful additions to the literature and adaptable for classroom use, they tend to be a little thin. One hopes that in any future case studies the authors would offer more about the political genesis of the litigation. The non-Arizona reader could also desire an analysis of the factors in the situation unique to Arizona—the structure of its judicial system, the backgrounds of the judges of its supreme court, the party breakdown in the legislature. The political scientists would profit from a greater attempt to link Arizona events to litigation elsewhere, something accomplished well in the *Southern Pacific* case but not in the other case studies. Perhaps the texts of the Supreme Court decisions, which consume an unnecessarily large portion of the text and which are easily attainable elsewhere, could be sacrificed on behalf of additional analysis. And with growing attention to impact analysis, the all-too-short epilogue ought to be expanded into a much closer examination of the acceptance or resistance by Arizona institutions of the Supreme Court Decision.

Despite some weaknesses of execution, the direction of the scholars of the University of Arizona ought to be emulated by those of us in other states. If their state, one of the youngest "of the several states" has spawned three dramatic cases within one decade, how very many case studies can be cultivated from the gardens in our backyard. One would hope that the work of Arizona's political scientists will stimulate a large yield from elsewhere in the Union.

JEFFREY B. MORRIS

*The City College of
The City University of New York*

The Threads of Public Policy: A Study in Policy Leadership. By Robert Eyestone. (Indianapolis: Bobbs-Merrill Company, 1971. Pp. 197. \$8.50.)

Eyestone's book is important in its own right and as an early book-length product of the City Council Research Project, a large-scale survey of 435 city councilmen in 89 San Francisco Bay area municipalities. The resulting data include individuals, aggregates and whole councils in units. In concept, design and the topical importance of suburban politics, the book is part of the growing body of work moving local government studies into the mainstream of political science research. While not ignoring wider economic and institutional factors, Eyestone seeks to focus on a political explanation for local decision making.

The author's idea is briefly that metropolitan areal settlement patterns result from the history of proximity to employment and market centers as affected by transportation technology. Different locations in the metropolitan area thus go through a sequence of development, but the regulating agents currently affecting settlement are subject to continuous change. This idea takes the form of a typology of "urban realms," based on the work of Vance, a geographer, and is described by the author as "intuitively understandable" (p. 41). The seven categories are based on at least three separate criteria: type of dominant land use, location within the metropolitan area in relation to commuting pattern, and time of settlement. Later in the book, the realm categories are collapsed into three—core, suburban and fringe cities. The classification is used as an introductory typology and later as an analytical variable. *Policy leadership* is exercised when the external developmental forces create the opportunity for local council choices which are determinant. Eyestone defines two kinds of local expenditures as particularly revealing of policy choice—planning and amenities (optional services including parks, libraries, recreation and health). Neither is a hard local service without which the city cannot function, yet each represents a decision by a council. While perceptions of policy problems vary from realm to realm, neither planning, mentioned more often in the developing cities, nor amenities is cited often in an absolute sense by any of the councils. With both aspects, some operational problems are present. For planning, expenditures are often related to a desire to protect the integrity of community values through land use control, rather than a conscious policy based on the advantages of planning *per se*. With amenities a similar problem is that those cities with residents able to provide their own amenities may not see it as a public policy matter. As the author later points out, the planning and amenities aspects are just one set of policies in which leadership can be exercised and studied, and it sometimes appears that other policy areas might have been more productive for clearcut policy-making analysis, although the purpose and specificity of the author's model deserve the consideration he gives it.

To study city policy choices, Eyestone develops the notion of policy profiles. Cities high on both planning and amenities expenditures are labeled advanced; those low on both, retarded; those low on either one and changing on the other, emergent; and high on one aspect with the other changing, maturing. In addition, there

are transitional sub-phases for those high on one aspect and low on the other. The 89 cities break about equally into the categories through the use of medians as cutting points. Using scale scores, Eyestone finds that councilmen in the maturing and advanced cities have slightly higher positive attitudes toward change, and fuller concepts of city future role. Councilmen in maturing and advanced cities tend to be more "political" in style, those in retarded or emergent cities more "pragmatic" and "fatalistic." Voting splits occur most often on advanced councils, least often on retarded councils.

The author turns next to establishing the correlates of the policy profile categorization. Knowing councilmen's perceptions of problems is not directly helpful in predicting policy choices. The data demonstrate that density increases regularly with the direction of policy as defined, generally population increase exerts the same effect, as does tax rate but not per capita expenditures. Using policy development as the dependent variable (by assigning scores as if it were a ratio scale), the author finds in a series of regression analyses that future role scores (though the scale seems to incorporate different dimensions) and the population variables of density/growth rate are relatively strongly predictive. Multicollinearity presents a problem in interpreting these findings, and it is also evident that most of the variables contribute little to an explanation.

The urban realm typology, as can be seen by rearranging Table 5-2, shows a regular and continuous though not complete relationship with policy. Yet when density is removed from the regression equation, the realm residual effect is insignificant. Since the realm rubric was constructed in such a way that density is an implicit variable (injecting elements of circularity for parts of the analysis) this finding ought not to be dismissed easily, because density itself appears throughout the analysis as a main factor, logical albeit stark. The author notes that a close examination of the cities which are exceptions to the tendencies found with the aggregate indicators would highlight policy leadership, but he does not fully exploit that class of cities analytically.

Again drawing on the realm types, the author then constructs models using the promising variables for planning and amenities separately. The models based on simple and partial correlations do suggest some of the relationships of aggregate and attitude variables in producing the expenditures, while the further steps of multiple correlation and regression coefficients

yield these results: In each group only one or two variables account for most of the variance or are significant; with the exception of density for amenities and future role for planning, the effect of the variables in the model is different in the three city categories; and in each multiple correlation the variables included explain less for the suburban cities. Hypothesized differences based on realm in relation to policy spending do emerge, while the aggregate variables continue to be dominant. The more explicitly political variables originally seen as linking the environment to policy leadership have a more diffuse and unpredictable relationship to policy. Thus the outlines of metropolitan development and policy are clearer than the choice mechanisms.

The book raises questions and presents or suggests ways of finding answers. Are local governments dealing on such a rudimentary level, or so constrained by their environments, that we cannot develop a political theory of local policy? Do the lines of local representation have too much slack to trace them productively? How is political style related to substance? What are the unknown variables needed in the model equations? To provide fuller answers, we need further monographs of the project and additional research efforts which can build on the base Eyestone has established. At the exploratory and multivariate stage at which we presently find ourselves in this kind of research, the mixed findings on the political variables and the willingness to grapple with typological problems add to the basic value of this book in developing an approach. The author's analysis improves our grasp on collective decision making and urbanization theory.

EARL M. BAKER

Temple University

President and Congress: Power and Policy. By Louis Fisher. (New York: Free Press, Macmillan, 1972. Pp. vii, 347. \$7.95.)

Repeated conflicts between Congress and the president over Viet Nam policy, the 1972 effort to grant President Nixon an item veto over federal spending, and a host of lesser tensions between the executive and legislative branches of government focus attention once again on the proper role of Congress and the presidency in national policy making. Few questions about the federal government have received as much scholarly attention as this one, but despite the abundance of such studies, Louis Fisher's book is a notable addition to the literature. Fisher deals with important—one is tempted to say

"relevant"—questions and he treats them well.

President and Congress is an historical review of the theory and practice of the separation of powers in the United States. Fisher argues that the political experience of the Founding Fathers inclined them in favor not of a rigid system of separated powers but rather a flexible system of checks and balances that allowed ample room for the president and Congress to decide, on a pragmatic basis, who was to do what in different areas of policy making. Many writers have, of course, noted and deplored the liabilities of a system in which policy-making roles are achieved as a result of struggle, not neatly prescribed by charters or organized along tight party lines. Fisher's contribution is to examine the variety of ways in which Congress and the presidency have adjusted themselves to a system of separated institutions sharing powers. Three issue areas are covered in the book: spending, taxing, and war.

What is most impressive about the history of these issue areas is the degree to which Congress has ceded broad discretion to the executive. Lump-sum appropriations that give only vague directions to the executive as to how money is to be spent, contingency funds (that, for example, allowed President Kennedy to establish the Peace Corps), the authority of the president to transfer money from one category of appropriations to another (the method by which President Nixon gave aid to Cambodia following the 1970 invasion), the reprogramming authority of the executive which permits the shifting of funds within appropriated items, "no-year" money which is spent when the executive decides to spend it, impoundment which allows the president to nullify congressionally-approved programs, and unauthorized commitments (Teddy Roosevelt sending the fleet around the world and forcing Congress to pay for the trip)—all of these add up to an impressive array of executive branch spending powers. Congress (more precisely, the Senate) has so far refused the president blanket item veto powers over appropriations, but if such a move should occur it would be in line with ongoing practices rather than being a sharp new departure. When it comes to taxation, Congress has (with the exception of the tariff) jealously guarded its powers; the historic legislative power of the purse, on the other hand, appears to be increasingly more shadow than substance.

Regarding the war powers, Fisher makes a persuasive case that Congress has ceded too much power to the executive, and he illustrates his case nicely with an examination of the Safeguard ABM issue. The alleged characteristics

of the executive branch that uniquely equip it to handle foreign affairs—unity, concern for the national interest, expertise—do not, in Fisher's view, hold up well under intensive scrutiny; thus there is no justification for the congressional inferiority complex in matters of war and peace. Foreign policy making in the executive branch is characterized by fragmentation, log-rolling, and disunity; defense procurement is marked by collusion between private contractors and the Defense Department; and the celebrated expertise of the executive has not prevented huge cost overruns or the firing of experts who fail to abide by the seemingly universal injunction attributed to Sam Rayburn: The best way to get along is to go along. The list of horrors, though familiar, is nonetheless strong support for the argument that Congress should reassert its prerogatives in foreign policy making and restructure its procedures to ensure that it is a significant participant in the day-by-day processes that determine American foreign policy.

Once the Johnson policy in Viet Nam became politically untenable, dozens of congressmen suddenly became concerned over executive warmaking powers. Fisher's arguments are likely to fall on receptive ears. But the crucial test for Congress is a prospective one, not Viet Nam. What Congress is willing to do, and what those in Congress specializing in foreign affairs are willing to do, depends heavily on the direction of the political winds at any given moment. The current situation favors congressional resurgence in foreign affairs, and there are many signs that the imbalance in favor of the executive branch is changing. But it takes more than a single disaster or an act of will for Congress to reclaim its power in foreign policy making. A more fundamental change is a new consensus inside and outside Congress—a consensus in which the president shares—that American involvement in foreign wars should be decided not on a piecemeal basis by the executive but only after long, searching public debate. The Viet Nam experience exposed the dangers of the accretion of presidential war powers. The legacy of Viet Nam, therefore, may well be a fundamentally different context for foreign policy making than has prevailed in this century.

Political scientists who are looking for systematic data collection and hypothesis-testing will be disappointed with this book. Many of the author's findings are, furthermore, commonly found in the literature on Congress and presidency. Still, the author presents a good case that in addressing old questions about gov-

ernmental institutions we should not be hamstrung by dubious arguments over the intent of the Founding Fathers. They, like their successors in office, used theory to embellish an argument, not to prove it. *President and Congress* is good traditional political history and, as such, is a useful primer for those interested in debating time-worn but still timely issues of American national government.

JOHN F. MANLEY

Stanford University

The State of the Cities: Report of the Commission on the Cities in the "70's." By Fred R. Harris and John V. Lindsay, co-chairman. (Praeger Publishers, 1972. Pp. 114. \$4.95.)

Those of us who live in or study the city have been aware of an "urban crisis" long before the American public was temporarily shocked out of its complacency by the riots that occurred in 1967 and 1968. Since that time, some effort has been made to ascertain why the disturbances occurred and how they could be prevented in the future.

The most prominent and most widely distributed study of the 1967 disturbances was the Report of the National Advisory Commission on Civil Disorders (The Kerner Commission), which suggested that as a result of a continuing pattern of racial discrimination and conflict the nation was becoming polarized into hostile camps of blacks and whites—a situation that would steadily worsen unless improvements occurred in education, housing, jobs, and police-societal attitudes towards minority groups.

The State of the Cities, a report of the Commission on the Cities in the '70s, was sponsored by the National Urban Coalition and co-chaired by Senator Fred Harris and Mayor John Lindsay. It sets out to answer three main questions about urban life three years after the Kerner Report was released: "Has America changed? Are the cities better or worse? Are there new problems, challenges, that have arisen in three years?" It looks for its answers by visiting on the one hand several cities previously affected by disturbances, and on the other, cities like Phoenix and El Paso which escaped previous difficulties but had large minority populations. In each city, the Commission members toured the ghetto areas and spoke to governmental officials, leaders of business and civic groups, and the "man in the street." From these contacts, plus staff background papers, the final report was assembled.

The Commission concludes that despite widespread agreement that the poor conditions of life in the urban ghettos were largely respon-

sible for the disorders of the 1960s, "most of the changes in those conditions since 1968 . . . have been for the worse" (p. 4). We are told that housing is still poor, schools are even more turbulent, crime and drug addiction have increased, welfare rolls are higher, and police-minority-group relations are just as hostile. Reference is also made to the tendency of an increasing proportion of blacks and Mexican-Americans to inhabit the central cities, while the suburbs continue to be overwhelmingly white.

This report dramatically highlights the continuing nature of urban problems in our society, and also demonstrates the failure of government policy makers to cope effectively with these problems. In several respects, however, the study is disappointing. Its main shortcoming is a lack of originality. Over the past several years many studies such as this one have been released by governmental and citizens groups. Each documents the poverty, discrimination, and feelings of despair experienced by ghetto residents, and each suggests essentially the same solutions. The Commission itself acknowledges this point, and instead of making new recommendations, it suggests instead that those proposed in the past by groups like the Kerner Commission be fully implemented.

Another deficiency relates to the contents of the document. The actual report is fairly short (32 pages), and much of it is highly impressionistic. The details of conversations held with residents of the cities visited, plus a narrative account of problems faced by them in their daily lives can provide the reader with valuable insights. It is difficult, however, to generalize from these findings. One might also ask why so few cities—six in all—were examined. The only other source of documentation comes from the background papers which are mainly condensations of previously published governmental or scholarly reports. In their present form, they make little contribution to increased understanding of the urban scene. It would seem that what is needed at this point is not another report by a "blue-ribbon commission," but rather, research into why previous remedies have not been enacted or proved successful, and what concrete plans for action can be formulated.

RICHARD D. FELD

East Texas State University

The Winning of the Midwest: Social and Political Conflict, 1888–1896. By Richard J. Jensen. (Chicago: University of Chicago Press, 1971. Pp. xvii, 358. \$12.50.)

Professor Jensen of the University of Illinois at Chicago has made a significant contribution

to the ever-growing field of 19th-century political history. His analysis goes beyond emphasis on a single election or issue to stress the importance of underlying conditions in American society that were operating to upset the political equilibrium in six midwestern states.

The Midwest became a Republican stronghold at the time of the Civil War electoral realignment. There were few signs in the early 1880s that within a decade this dominance would be seriously threatened. The succession of Democratic victories in state and congressional elections from 1889–1891 gave some indication that the change in voting behavior involved more than short-term defection. The stability of party identification which had been so characteristic of the post-Civil War years appeared to have been undermined. If the voters who had crossed party lines had undergone full-fledged conversion of loyalties the election of 1896 might indeed have been "critical" and a lasting partisan realignment might have resulted. When the reorientation occurred, however, the Republicans were again dominant, and a party system had been established that would persist in this region for another generation.

It is Jensen's theory that the succession of landslides was the direct result of the intensification of social conflict. He stresses the importance of religion in 19th-century American life, and emphasizes its role in determining party affiliation and in shaping political issues. Pietists struggled with liturgicals in every denomination, and the conflict became intense whether the issue concerned the prohibition of the liquor traffic or restrictions on church schools. When it appeared that the moralists had achieved success in several states through control of the Republican party machinery, the political results were decisive. Only if pragmatic professionals could curb the crusading amateurs, or if new issues appeared, could the GOP hope to recover its former position of supremacy in the Midwest. The recognition of diverse cultural and moral belief systems among the electorate prevented the continuation of old-style monolithic campaigns, whether pietistic or partisan. The Republicans made a remarkably successful adjustment, and McKinley's pluralism attracted increasing support from nearly all ethnic groups in 1896. The Democratic party moved in the opposite direction, and Bryan's moralistic and millennialist crusade alienated many of the voters who had contributed to the success of the party earlier in the decade.

The author does not ignore economic matters, but he argues that some historians have

overemphasized class conflict. He concludes that in these states and in this decade economic issues were less important than cultural conflicts. Campaigns waged on the tariff or monetary issue, for example, did not arouse the same high level of antagonism among immigrant voters as those that involved religious and ethnocultural allegiance. The impact of the severe 1893 Depression was significant, but the elections of 1894 constituted a decline for the Democrats rather than a great advance for the GOP. This view supports the conclusion of Paul Kleppner in his recent study of Wisconsin, Michigan, and Ohio that the shift away from the Democrats cut across all social groups. The citizens who chose to express dissatisfaction by staying away from the polls were important, but those who sought a political alternative in a third party were not. Whatever success agrarian radicalism had in other sections, the Populists were not a major force in this part of the Midwest. The evidence in both studies indicates that even under the impact of widespread economic distress, the tradition of party loyalty helped retard the decline of Democratic strength. After 1896 the voters who had changed political direction found themselves part of a political organization that had become more tolerant of social diversity and that held power during a period of improving economic conditions. Thus what may have been temporary deviation became a more durable relationship within a new majority coalition.

This analysis of party affiliation in a period of political change suggests possibilities for further research. We need studies of state politics at other times and in other regions to determine whether the Midwest was unique and whether a similar polarization of religious and cultural attitudes played a significant role in altering the voting behavior of the American electorate during the 1850s and the 1920s.

The critical essay on the sources is both comprehensive and discriminating. The documentation reveals skill in locating new and significant information. The material presented in the tables and in the appendix indicates to some degree the extent of the statistical investigations. Professor Jensen has been a leader in the group of historians who have been promoting the use of quantitative analysis in historical research. His book is an excellent example of what can be accomplished when sophisticated statistical techniques are used to discover patterns of stability and change, and to clarify historical relationships over a period of time.

JAMES A. MELDRUM

Elmwood Park, Illinois

Environmental Law and Policy: Readings, Materials and Notes on Air Pollution and Related Problems. By James E. Krier. (Indianapolis: The Bobbs-Merrill Company, Inc., 1971. Pp. 480. \$13.50.)

Professor Krier's collection of readings is an excellent compilation of materials on the pollution problem and, taken as a whole, is also a provocative examination of alternative approaches to pollution control. Although its focus is on environmental law, it deals in broad-ranging fashion with many problems of public policy.

Krier states (p. 293): "The materials that follow focus primarily on the air pollution problem, but the issues they raise are of much broader significance. Consider the materials not in isolation but in the context of all the machinery of the legal system and the limitations of the real world." The materials selected, the manner in which they are organized, and the author's probing notes and questions facilitate the reader's ability to put the materials in a broad context.

About half the readings are court cases and articles from law journals. Most of the landmark cases, from William Aldred's Case (decided in 1611) to Calvert Cliffs' Coordinating Committee v. Atomic Energy Commission, are included. The other readings cover a wide gamut of authors and subjects. Economists are well represented, particularly J. H. Dales, but also Kneese, Woloizin, Gerhardt, and Mills. There are several excerpts from Naderite John Esposito, the transcript of a television debate on the internal combustion engine, and a detailed and very good analysis of the inner workings of the San Francisco Bay Area Air Pollution Control District. Most of the selections were written in the late 1960s, but more recent events, such as implementation of the 1970 Clean Air Act and the National Environmental Policy Act, are also covered.

The book is divided into three sections: the problem of pollution; the pollution problem and the courts; and pollution control legislation and its administration. The first section provides Krier's basic framework which is drawn not from the law but from welfare economics. It is best summarized in a selection from Calabresi (p. 139):

Problems of misallocation of resources and externalities are not theoretical but empirical ones. The resource allocation aim is to approximate, both closely and cheaply, the result the market would bring about if bargaining actually were costless. The question then becomes: Is this accomplished most accurately and most cheaply by structural

rules (like anti-trust laws), by liability rules, by taxation and governmental spending, by letting the market have free play or by some combination of these?

The extent to which the courts can efficiently allocate resources is discussed in the second section. As might be expected, the courts have not been consistent in their application of doctrines such as nuisance and trespass. Some of the judges have weighed the social costs and benefits in arriving at their decisions, while others have read the law to preclude a balancing of the social consequences. The limitations of the courts as a vehicle for setting pollution policy are described, although the key problem of the courts' ability to deal with scientific questions is not given much attention.

The selections and commentary dealing with pollution control legislation reveal Krier's doubts about the effectiveness and efficiency of the Federal air pollution legislation. Two rather bland descriptions of the 1967 Clean Air Act are followed by savage blasts from Esposito. The concluding portion of the section on legislation is devoted to a discussion of pricing systems, and the reader is led to side with the theme of a reading from Larry Ruff (p. 424): "About all that can be said in favor of this price method is that it is logical, fair, comprehensive, practical, and much better than any of its alternatives." Krier's economic framework leads him to the same conclusion most economists have reached—namely, that a pricing or effluent fee scheme would be superior to the current regulatory system.

A book of readings, if it is to be an effective educational tool, should have a framework and a point of view. As the above indicates, *Environmental Law and Policy* meets this standard admirably. At the same time, its selections are balanced and well-chosen, and it successfully forces the reader to consider for himself the difficult questions posed.

The Krier volume would be an excellent text for courses in environmental law or the role of law in meeting societal problems. Its legal focus makes it less useful for courses in public policy, but the variety and high quality of its selections would make it a very good supplementary text for such courses.

J. CLARENCE DAVIES, III

The Council on Environmental Quality

Ends and Means of Reducing Income Poverty.

By Robert J. Lampman. (Chicago: Markham, 1971. Pp. 168. \$3.95, paper.)

Robert Lampman has written the primer on American poverty. He has distilled more good

sense, pertinent information, and focused concern about American poverty into 168 pages than is contained in any collection of books and articles ten times this length. A catechism on this book should precede immersion into the eschatology and econometrics that characterizes most of the poverty literature.

The style of this book is refreshing. Lampman has a single-minded concern about American poverty. This book is drawn primarily from his own writings on this subject for more than 20 years and from those of his colleagues at the Institute for Research on Poverty at Wisconsin. At the time poverty became a major political issue, Lampman was one of perhaps a dozen Americans who had done serious scholarly work on which to base policy strategy, and this book was written to maintain public concern about poverty against the competition of other issues and against a legitimate skepticism about the efficacy of many public programs. He is a nominalist and wields Occam's razor with zest. Income poverty is defined as a state of low income. Poverty is a different condition from alienation, disability, discrimination, despair, inequality, powerlessness, and unemployment; although these conditions are often related, eliminating any one of these conditions will not eliminate the other conditions, and each deserves to be studied on its own merit. Once one accepts this mental set—a focus on income poverty—most of the data fall into place, and the major policy alternatives become apparent. Finally, Lampman is a rather old-fashioned economist, in the tradition of the Wisconsin institutionalists. One can only infer his theoretical structure from the strength of his argument. There is not an equation, a statistical test, or an indifference curve in his book, but he draws intelligently from the theoretical and empirical work of others. The major technical strength of the book is a very careful reading of the census data. For these reasons, and not in spite of them, Lampman has more to say about American poverty—to both scholars and men of affairs—than do most of us, singly or in combination.

The first three chapters efficiently summarize the intellectual and political background shaping American poverty policy. These chapters do not bring the reader quite up to date, because they exclude both the recent developments in welfare economics and public choice theory and the recent debate over welfare reform, but they provide a sufficient stage for the analysis of contemporary conditions.

The middle four chapters are the main strength of this book. These chapters summa-

rize and analyze the current characteristics of the poverty population, changes in the level and composition of the poverty population since 1947, and the projections of this population. Lampman uses the Social Security Administration definitions of poverty incomes without reservation, recognizing that this yardstick, like any yardstick, is arbitrary but nonetheless useful. His major findings deserve repeating:

- The poor are much like the rest of us, except their incomes are lower. For example, the representative poor family is white, lives in an urban area outside the central city, has an able working family head, and is not on public assistance.
- Poverty is disproportionately high among the aged, the disabled, families headed by females, minority races, those with little education, and those who live in rural areas, although only little education among these conditions characterizes the majority of the poor. In contrast, most of the people in each of the above groups are not poor.
- For many of the poor, poverty is a transitional status. Around one-fourth of the poor in one year move to a higher income group in the next year.
- The proportion of the American population with poverty incomes fell from 30 per cent in 1947 to less than 12 per cent by 1970, despite a relative increase of four population groups with a higher incidence of poverty.
- Much of the reduction of the poverty population has been due to economic growth. Other major contributors were the increase of public transfers and the movement of people to higher income occupations, industries, and regions.
- The American tax system has been only mildly equalizing for several decades. Although total transfers have increased rapidly, less than 40 per cent of these transfers accrue to the pre-transfer poor. Even this smaller amount has had a major effect in reducing poverty, reducing the per cent of the total population in poverty by 10 per cent and the poverty gap of the post-transfer poor by over \$10 billion.
- Recent projections of the poverty population suggest that the poor will number around 8 per cent and the poverty gap will be reduced to about \$5 billion by 1975. The composition of the poverty population is not expected to change much, despite the relative immunity

of major groups in this population to economic growth.

These conclusions suggest that elimination of American poverty, in terms of establishing a floor under family income, is achievable in this decade, without a major increase or reallocation of public funds and without a major restructuring of our society.

The final two chapters summarize the broad strategies for reducing poverty and considerations for selecting among these strategies. Although these chapters are not definitive, whole sections deserve quotation as guidelines for maintaining perspective and focused concern about American poverty. Lampman finally opts for rather marginal changes in government programs—\$2 billion to raise public assistance minimums in the low income states, \$4 billion to supplement the incomes of the working poor, and \$4 billion to increase job-related education and training and to create jobs for the poor. My own quibbles with his suggested strategy are minor: My sense is that he underestimates the value of a wage-subsidy system for the poor and overestimates the value of education and training, but these are technical details which could be worked out. One hopes that the views expressed in his final sentences are widely shared:

Ending income poverty does not require and will not achieve a transformation of society. It is a modest goal. . . . Dedication to the goal of eliminating income poverty requires that we scrutinize every expenditure made in the name of the poor to make sure that a great share of the benefits go to them. We should proceed, not with utopian expectations, but with the belief that achievement of this particular goal, along with progress toward other social and economic goals, will be a worthy achievement in the slow evolution of the good society.

WILLIAM NISKANEN

University of California, Berkeley

America on Trial—The War for Vietnam. By General Thomas A. Lane, foreword by General A. C. Wedemeyer. (New Rochelle, N.Y.: Arlington House, 1971. Pp. 297. \$7.95.)

Evidence can be assembled to argue that the late President Ngo-dinh-Diem was overthrown by the South Vietnamese generals in 1963 at the behest of American public opinion rather than of Vietnamese public opinion; that if he had not been murdered on the spot he would have returned to power within two or three years; that more blood has been shed in Viet-

nam because he was overthrown than would have been shed if he had not been; that the Indochina Communist Party is heir to the old Bolsheviks of the Comintern; and that the communist bloc has remained "monolithic" in this one arena of the world revolution if in no other. But General Lane shows no inkling of what the evidence is: he argues from prejudice alone.

Working from a handful of superficial secondary sources, and with no direct knowledge of his own to supplement them, he bludgeons the reader with an unremitting tirade of chauvinistic invective. U.S. administrations, he declares, have persistently shrunk from hitting the Chinese and Vietnamese communists hard enough. The culminating sin has been the Nixon doctrine, arrived at on misleading advice, the identity of whose author—Sir Robert Thompson—gives the sinister show away. That British counter-guerrilla expert, General Lane declares, lent his international reputation in 1969, for selfish British reasons of state (p. 211), to the false report that things were going well in Vietnam and thereby abetted President Nixon's soft-on-Communism foreign policy. In fact, General Lane's finger points at the British as multiple culprits—over Nationalist China and Korea as much as over Vietnam—because they have persistently "vetoed" (pp. 46 and 287) America's pursuit of a foreign policy in American interests, with the unworthy purpose of safeguarding their wretched colonialist possessions in Hong Kong from Red Chinese retaliation (p. 76). What is needed now ("by 1973"—pp. 229–31) is the mounting of an "invulnerable nuclear capability" in defiance of Russia and China, to coincide with the return home of American forces from both Asia and Europe. Rebellions will then break out, apocalyptically, in all Communist countries. Thus the Free World will be saved.

As political or strategic analysis, this book is laughable. The author contrives to introduce some element of inaccuracy into nearly every statement he makes; the silliest is that, going from China to Vietnam, one "crosses the Himalaya mountains" (on p. 29 and again on p. 68). He deserves to be thrown to the Concerned Asian Scholars.

DENNIS J. DUNCANSON

University of Kent, England

Federal Funding and National Priorities: An Analysis of Programs, Expenditures, and Research and Development. By Leonard Lederman and Margaret Windus. (New York: Praeger Publishers, 1971. Pp. 213. \$15.00.)

The authors of this book had a very limited purpose; they wished to demonstrate exactly what the title suggests about trends in federal spending over the course of a decade (1961–1971). They deduce from these statistics changes in national priorities. In addition to gross spending for federal programs, they also separate out expenditures for research and development, and relate these to their parent programs. As they state in their preface, they are concerned with “what is,” not with “what should be.” Their major source of information is *The Budget of the United States*.

This book can have some value as source material to political scientists, although its authors are economists. They have accomplished their limited objective in a workmanlike manner. This reader, however, found it disappointing on a number of counts. The bulk of the study describes all the major federal programs, grouped into what the authors call “super-goals,” and indicates the trends in spending of each. The writing style bears a close resemblance to that of the principal source of their data. Occasionally, the authors suggest some of the common criticisms of the programs, but space limitations prevent serious discussion of these. The almost total absence of any commentary or opinions makes for rather unexciting reading. Their findings will hardly be surprising to anyone who follows the ups and downs of federal programming. Because their data only cover actual expenditures through the Johnson administration, one gets little insight into changes in priorities effected during Mr. Nixon’s first term. The way the data are presented offers little opportunity to judge who are the principal beneficiaries of federal spending. And, they do not distinguish direct federal spending from grants to cities and states, an exercise which would have been useful.

To sum up their conclusions, the authors find declines during the decade in the percentage of total outlays in their “supergoal” categories of “national security,” “space,” and “commerce, transportation, and communications,” while “income security and welfare,” “education, knowledge, and manpower,” and “health” showed significant increases.

Their final chapter, entitled “The Likely Future,” is based on past data trends and “judgments about the possibility of breaks in these trends due to already apparent changes in priorities . . .” (p. 183). The authors predict continued growth in the areas that grew in the 1960s.

FRANK C. COLCORD, JR.

Tufts University

City Managers in Legislative Politics. By Ronald O. Loveridge. (Indianapolis: Bobbs-Merrill, 1971. Pp. 224. \$8.50.)

Students of local government are well aware of the traditional controversies surrounding the role of the city manager: Should managers make policy, or should they merely confine themselves to administration? Are managers motivated solely by a concern for efficiency, or do they have broader social goals?

In his useful and readable study, Ronald O. Loveridge avoids the exhortative, debating approach which has characterized much of the literature in this field. Instead, the author provides a systematic analysis of the ways in which city managers define their policy roles and participate in the political process.

Loveridge’s analysis is based on interviews with city managers, mailed questionnaires to city managers, and interviews and questionnaires with city councilmen—all in the San Francisco Bay Area. The study is part of the City Council Research Project of the Institute of Political Studies at Stanford University.

In examining city managers’ views of their proper policy roles, Loveridge found “overwhelming agreement that the city manager should be a policy innovator and policy advocate” (pp. 49–50). Eighty-eight per cent of the managers studied agreed with the statement that “A city manager should assume leadership in shaping municipal policies” (p. 49). When the author turned to city councilmen, however, he found a very different conception of the proper role of the city manager. Eighty-seven per cent of the councilmen in the sample agreed that “The city manager should act as an administrator and leave policy matters to the council” (p. 86). Councilmen consistently voiced the opinion that the city manager should serve as a staff aide and adviser to the council.

Given this policy role conflict, city managers were found to utilize a number of strategies in dealing with councilmen. Loveridge discovered that the manager might consult informally with individual councilmen, authorize staff reports to prove certain points, hire outside consulting firms to make recommendations, prepare the agenda in ways which would influence policy decisions, and so forth. By using these strategies, managers could influence policy without unduly increasing councilmanic anxieties.

Although there was a substantial area of agreement in city managers’ definitions of their role, Loveridge does identify different levels of support among managers for the view that they should make policy. And the author found that these differences in normative policy orienta-

tions were reflected in styles of political behavior. Those who endorsed a strong leadership role for managers tended to advocate major policies and to work actively with community groups, while most of those who defined the manager's proper role in a more limited way revealed themselves as avoiding contentious policy questions.

One of the most interesting parts of Loveridge's study is the identification of sources of differences in orientation among managers themselves. Loveridge presents a number of background factors which are found more frequently among aggressive political managers than among their more constrained counterparts: college education; social science major; graduate work; outside appointment (not on city staff); apprenticeship in city management; short period of service (15 years or less) in municipal government. The author also argues persuasively that professional identification and participation in the International City Managers' Association can be forces in the development of an ambitious definition of the manager's role.

Another strong section of the book is that in which the author documents the widely differing opinions of city managers and councilmen about the proper role of managers in the policy process. But the identification of this conflict in role perception raises some questions which are not answered in the study. Although Loveridge does describe strategies by which a manager can further his goals in the city council, he does not deal with the question of open hostility between manager and council. Given the differences in role perception, one would expect serious confrontations to take place. And if such is not the case, what is the explanation? Loveridge's findings show that city managers do participate in policy initiation and leadership. Are they so adept at masking such activity that councilmen are not aware of what is going on? Or are councilmen able to invent face-saving rationalizations for managers' active involvement in the making of policy? It has often been said that councilmen hold a trump card in their power to fire the city manager, but it would be interesting to know how often—and under what conditions—this power has actually been used.

The weakest segment of the book is the last chapter, "City Manager in Community Politics," in which a number of broad assertions are made without any supporting evidence. Dealing with the question of city managers and democratic values, Loveridge makes the following statements: "Probably no member of the local elite is more open to diverse

public influences than the city manager" (p. 160). "The manager often represents those whose interests are not represented in the elite. Negroes provide a good example" (p. 161). "Unlike . . . most elite members, the city manager champions the general welfare of the community as opposed, for example, to the special interests of business, labor or civic groups" (p. 161). Such claims demand considerably more explication and support than this volume provides.

In fairness, it must be noted that the last chapter is somewhat speculative in tone and, at any rate, not crucial to the study. The rest of the book is a carefully argued, well-written contribution to our understanding of the perceptions and behavior of city managers.

JEFFREY L. PRESSMAN

Massachusetts Institute of Technology

With All Deliberate Speed. Edited by John H. McCord. (Urbana: The University of Illinois Press, 1969. Pp. vii, 205. \$7.50.)

This frequently interesting set of essays says a great deal more about the practice than the theory of civil rights. As Professor McCord writes in his foreword, the authors here are not detached academicians, but "crusaders and public teachers for civil rights" (p. vi). Following a useful general summary of the development of civil rights from the Civil War to the present (written by the student editors of the *University of Illinois Law Forum*, where the symposium first appeared), there are articles on education, public accommodations, and housing, which discuss prospects for future progress toward equality in the context of analysis of the current legal situation. The article on employment opportunities is a detailed case study of a successful action by the federal government intended to serve as a model for the future.

As a book which captures the state of civil rights at a particular point in time and makes proposals for action in the immediate future, *With All Deliberate Speed*, is in some respects already outdated. A good deal has happened in the four years since it was written, and the advice it offers on tactics is therefore no longer entirely relevant. In the intervening period, for example, the decisions in the *Mecklenberg* and *Holmes* county cases have dramatically accelerated the pace of school desegregation in the South, and the Philadelphia plan and other federal affirmative action programs have changed the picture in employment.

But there is another and more subtle sense in which the passage of time tends to undermine the book. All of the authors base their analyses

and proposals on the assumption that full equality can and should be achieved by governmental action. Increasingly, however, doubts grow as to whether this is indeed possible or desirable. This is by no means to suggest that the authors here are wrong in their assumptions, but that they fail to take account of the objections which are more and more being raised against them.

This is clearly true of the piece on equal educational opportunity by Robert L. Carter, former NAACP General Counsel (1956-68). Its lucid and informative analysis of the developments since *Brown v. Board of Education* rests on the assumption that "... segregation, in and of itself, denies equal educational opportunity" (p. 62). But this assumption must now be confronted with Christopher Jencks's carefully documented judgment that "... the case for or against desegregation should not be argued in terms of academic achievement" (Jencks et al., *Inequality* [New York: Basic Books, 1972], p. 106). Carter also falls short in devoting only a brief and rather cryptic paragraph to what he admits to be the "growing clamor for something called community control or decentralization" (p. 83). It seems especially true here that the determination to have governmentally imposed integration, and therefore presumably equality of educational experience, blinds him to other very real values to be taken into account on the other side.

The same sort of point can be made even more forcefully about the liveliest and most intellectually stimulating piece in the volume, Meiklejohn Library President Ann Fagan Ginger's article on housing. Ms. Ginger looks upon housing as a public utility, a necessity to be provided to each of us by the most efficient possible means. Seen from this perspective, the private housing market is naturally found to be unfair and inefficient. In contrast to the current state of affairs we are given a nostalgic picture of those systems, from feudalism to the company town, which once provided housing for the worker. Then we are offered a model for the future in which a single government agency would control the provision of housing for each of us, bringing back the benefits of feudal stability and eliminating discrimination "... on the basis of race or financial condition" (p. 177). Of course this would mean that housing is no longer private property. But most of us don't really own our own houses anyway (the bank does), and we already get most of the vital services which make our houses habitable from the government. Why not recognize the fact that private property has ceased to exist and adopt the proposed model?

The answer lies in those considerations which Ms. Ginger chooses to disregard. Admitting that we are already far too dependent on banks and governments to claim that our homes are really our castles, it is still essential that we maintain and extend our right to choose, shape, and live in our homes as freely as if they were our castles. What would happen to what remains of our freedom to order our private lives as we choose, if we were faced with a centralized bureaucracy every time we wanted to make a major change in our housing, or the way in which we live in it?

But setting aside the problem of the desirability of such a system, growing experience with welfare bureaucracies should lead us to question the assumption that it would work. At least it is clear that the effectiveness of such a bureaucracy can no longer be taken for granted.

This is a book which may be most important, then, not as a blueprint for the future, but as a monument to a period of singleminded confidence in the government's capacity to solve the problems of equality, if only everyone would try hard enough: a period which is now rapidly coming to an end.

ROBERT S. GERSTEIN

University of California, Los Angeles

This Sacred Trust: American Nationality, 1798-1898. By Paul C. Nagel. (New York: Oxford University Press, 1971. Pp. 376. \$9.50.)

Historians have long been intrigued with the problem of defining the distinctive attributes of American nationality. Differing in their conceptualizations of the problem and in their methods of attacking it, they have produced a rich and varied literature on this baffling theme, to which Dr. Paul C. Nagel's impressive study must be added.

Nagel, who previously explored attitudes toward Union in his *One Nation Indivisible*, now examines "what being an American implied to the citizens of the Republic." He is concerned with the sense of nationality, rather than of nationalism, that found expression in representative statements by political leaders, publicists, and intellectuals. Thus he focuses on self-conscious interpretations of the nation's perception of its "calling" or "trust." Instead of the consistent, almost static ideological commitments identified by such scholars as Louis Hartz, Daniel Boorstin, and David Potter, Nagel finds ambiguity, agonizing doubts, and intolerable anxiety.

Beginning in 1798, as the young republic became aware of the full range of foreign and domestic threats that imperiled its existence, Na-

gel details the prevalent despair about the survival of the national experiment. After 1815, he tells us, the concept of a trust emerged, and although its nature was variously defined, there was constant fear that innovation, disunity, and man's evil nature would result in betrayal of the trust. The ante-bellum decade brought conflict between those who called for a stewardship of preservation and those "restorationists" who urged a dynamic quest for liberty, even at the price of Union. Then came the "atonement" of the Civil War, and with it the anticipation of a new birth of freedom.

But, in Nagel's view, the hoped-for regeneration proved illusory. Although both the Union and republicanism has been maintained, the sordid influence of Mammon threatened to pervert the high calling which had to be realized if nationality was to be achieved. Escape from the agony of an intolerable trust was accomplished in 1898, when the nation turned abruptly away from preoccupation with its shortcomings to embrace a new trust, that of pursuing a disinterested stewardship of moral betterment throughout the world.

So intricate and shaded is Nagel's treatment of his central theme that any *précis* can merely be suggestive. His study is important for the confirmation that it gives to the accepted notion that America has been singularly concerned with its calling, for the new emphasis it places on the extreme anxieties that such concerns produced, and for his suggestion, which I do not find quite plausible, that an escape from the old trust was achieved after 1898.

Among the weaknesses of the study I would cite the idiosyncratic conceptualization of "trust," the extreme reticence of the author to interpret his findings in general terms, and a scheme of organization that is often baffling. Others may share my bewilderment at Nagel's enigmatic conclusion that the republic can only fulfill its trust through humility. Students of American nationality will find the work more useful as a well-selected record of the varied perceptions of national goals than as a contribution to their theoretical understanding of the problem.

RICHARD P. MCCORMICK

Rutgers University

Mr. Republican: A Biography of Robert A. Taft. By James T. Patterson. (Boston: Houghton-Mifflin, 1972. Pp. xvi, 749. \$12.50.)

On a sloping lawn near the U.S. Capitol there stands an imposing hundred-foot tower, a memorial to Senator Robert A. Taft, Republican of Ohio, placed there by unanimous act of

Congress two years after Taft's death in 1953. No other Member of Congress, past or present, is so honored. In 1957, a special bipartisan committee of the Senate selected Taft as one of the five most significant figures ever to sit in the Senate. Both these signal honors attest to the special esteem in which Taft was held by his colleagues. Because he was the son of a President of the United States, several times himself a presidential hopeful, and leader of his party in Congress, it was inevitable that Taft would attract the attention of a biographer.

It was by no means inevitable, however, that Taft would receive a fair or sympathetic hearing at a biographer's hands. Most of his colleagues respected Taft for his intelligence, his mastery of facts, and his analytical power. Few of them liked him, however, or even knew him well, and many found him stubborn, narrowly-mindedly ideological, and cold. "Taft has the best mind in the Senate—until he makes it up," was a famous remark. He is remembered today for the Taft-Hartley bill, a law regulating labor-management relations enacted over President Truman's veto and widely regarded by union people as antilabor. Taft denounced the Nuremberg trials as ex-post-facto, and encouraged Joseph McCarthy in his assaults on the reputations of persons linked with the State Department. He was the foremost conservative politician of his time, yet he regularly sponsored bills for federally subsidized housing and aid to education. He opposed the excessive interventionism of the Marshall Plan but supported General MacArthur in Korea. As a member of the Yale Corporation he deplored the employment of left-wing professors but demanded that they be left strictly alone in the pursuit of their work. He was strongly partisan, a party regular, and highly conventional in his address to most questions, yet fiercely self-reliant and independent in his drive to master issues and present them in his own way. He wrote all his own speeches. And for all his conventionality he was never a religious man. He was for years an undisputed leader in an institution known far and wide as the world's most exclusive gentleman's club, yet in his personal relations he was relentlessly unclubbable—awkward, shy, and brusque.

James T. Patterson has done even-handed justice to this remarkable mélange of characteristics, neither forcing an interpretation upon recalcitrant contradictions in his subject's character, nor permitting an undue fascination with warts to obscure the main features of Taft's portrait. Patterson, whose previous work was on the conservative coalition in Congress, en-

joyed the full cooperation of the Taft family, and exclusive access to a formidable treasure-trove of family documents. In addition he seems to have combed through or interviewed every other plausible source for letters, diaries, and recollections. Although he has written an authorized biography, it is nevertheless an independent work of scholarship.

Two features in particular distinguish the book: Patterson shows a remarkably thorough grasp of the dynamics of congressional politics and of national politics more generally throughout the entire 60-year period of his narrative. And he is absolutely fair-minded in discussing the activities of Taft and his contemporaries. It is now fashionable in historical writing to commit the sin of anachronism, in which the historian parades his knowledge of how things turned out—plus his presumably superior moral insight—so as retrospectively to weigh and judge the acts of his subjects. By scrupulously refraining from any such nonsense Patterson has immeasurably enhanced the value of his book. He has also produced a well-informed and illuminating portrait of a significant American and the politics of his times.

NELSON W. POLSBY

University of California, Berkeley

The Long Struggle for Black Power. By Edward Peeks. (New York: Scribner's Sons, 1971. Pp. 448. \$7.95.)

The Black Man and the American Dream: Negro Aspirations in America, 1900-1930. Edited by June Sochen. (Chicago: Quadrangle Books, 1971. Pp. 372. \$2.95.)

For Blacks Only: Black Strategies for Change in America. By Sterling Tucker. (Grand Rapids, Michigan: William B. Eerdmans Publishing Co., 1971. Pp. 211. \$4.95.)

Differing in format, these books have similar concerns and common subject matter: the black experience in America. Each is timely and useful and has its particular merits. *The Long Struggle for Black Power* is a brief, well-documented history of major ideas, movements, and personalities in the saga of black Americans. *The Black Man and the American Dream* is a selection of articles on the American race problem, primarily by Negro authors, from periodical literature appearing in the first three decades of the twentieth century. *For Blacks Only* is a terse, personal, thoughtful analysis of the present state of the black revolution and pragmatic proposals for meaningful change.

The essays in Professor Sochen's book were taken from the *Nation*, *New Republic*, *Crisis* (NAACP), *Opportunity* (Urban League), and *Southern Workman* (Hampton Institute). They examine major aspects of Negro life: education, health, employment, migration, progress, discrimination, disfranchisement, etc., in the context of American values and goals.

Sochen's analysis of five dozen articles by Negro authors leads her to conclude that black writers in this era generally shared the values of white America and "used the rhetoric, methodology, and goals of the American Dream in their struggle for equality" (p. 3). Though aware of views of black radicals such as Monroe Trotter, Chandler Owen, and A. Philip Randolph, she finds little intense social ferment. She is amazed that black intellectual thought reflected faith in the democratic process and the possibilities of substantial progress within the American system.

Most reform movements in twentieth-century America, however, have been mounted on a similar faith. Thus, in view of the dynamic potential of many of America's professed ideals, the tortuous history of the black experience, and the realities of the Negro's struggle to survive in a hostile environment, this reviewer finds Professor Sochen's amazement difficult to understand. Most of these essays are well written, interesting, worth reading, especially Alain Locke's brilliant interpretation of the "New Negro," and Abram Harris's erudite analysis of one sector of the American Left. Harris reflects the intellectual potential that made him an outstanding scholar and teacher in economics (not sociology, as Sochen mistakenly claims).

These writings address many of the race issues still confronting—and dividing—black and white America. In these days of the "cult of blackness," when the legitimate quest for black identity and respect sometimes leads to counterproductive self-delusion, it can be helpful to consider the caustic comments of George Schuyler and the rebuttal of Langston Hughes. Michael Gold's presumptuous piece is another reminder of some white men's readiness to proffer unsolicited advice to the black brother.

Peeks's *Long Struggle* is a solidly written book, reflecting the author's graduate study in journalism. Based primarily on secondary sources, the volume is profusely documented by much of the best literature on Afro-Americans; and Peeks draws effectively upon his personal contact with the civil rights movement as a reporter covering historic events of the 1950s-'60s.

Peeks organizes his narrative around the

theme of self-help, which he perceives as a major strategy in the struggle for black survival and progress in America. Viewing organization of the Free African Society in 1787 by Richard Allen and Absalom Jones as the beginning of organized Negro self-help, Peeks traces this phenomenon in the creation of various types of voluntary associations. Enforced segregation and pervasive oppression forced black Americans to establish organizations to abolish slavery, aid the sick, bury the dead, educate youth, acquire land, establish businesses, fight discrimination, and so on. The establishment of churches, fraternal orders, banks, etc., reflected the Negro's recognition of the importance of group efforts. Peeks relates self-help to the antilynching movement, the fight against disfranchisement, segregation in public accommodations, discrimination in employment, the courts, and housing.

Peeks draws vivid portraits of black leaders who moved boldly upon the American scene and had massive impact on public opinion and race relations. He discusses black nationalism, boycotts, integration versus separatism, nonviolence versus violence, electoral politics, protest politics, and many other ideas, actions, and movements evolving out of the black man's struggle to find strategies for liberation. He presents in sharp, balanced perspective the cross-currents in Negro life, and the conflicts which have divided and weakened black leadership in the fight against exploitation and institutionalized racism.

Though it covers ground familiar to the social historian, particularly black scholars, nevertheless, most readers—especially students and the general public—can profit from reading this book. It should be required reading for those cocksure militants who lack understanding of the essential continuity of black protest and who tend to think that the fight against oppression began in the 1960s.

Tucker's *For Blacks Only* is not an exercise in scholarly documentation. It is a brief, stimulating statement, distilled from the active mind and rich experience of a man long and actively involved in the black struggle. The author has held responsible positions in the civil rights movement as national coordinator for the Solidarity Day March in support of the Poor People's Campaign and Vice-chairman of the 1963 March on Washington.

Whereas Peeks believes the civil rights movement has entered a new phase, Tucker feels it is dead. But despite America's retreat to conservatism, despite the deliberate abrasiveness of some embittered blacks, despite the polariza-

tion of the races, and despite white repression and black rage, Tucker believes that there are strategies which can be used to effect significant change within the system. He feels that the anger and energy of blacks can be channeled into constructive work. On the basis of his experience as activist and Urban League executive, Tucker shows how coalitions with other groups can successfully attack crucial problems in education, housing, employment, crime, political power, and representation.

Like Peeks, he defines and dissects black power and identifies its positive and useful aspects. Both Tucker and Peeks celebrate black pride and racial solidarity but reject black separatism. Tucker recognizes the uses and the strong appeal of separatism, especially to the powerless. He notes how overemphasis on cultural uniqueness and "the current fashionable focus on black identity serve white racism" (p. 99). Both Tucker and Peeks agree that Negroes cannot effect their liberation by their efforts alone; they must have help of white allies. Tucker understands how disillusionment with the slowing of civil rights progress led to expulsion of whites from some interracial organizations like the Student Nonviolent Coordinating Committee and the Congress of Racial Equality. He also realizes, however, that "it cannot be a long-term strategy" (p. 105).

Tucker and Peeks, like the black writers in Sochen's volume, reject revolution and violence as counterproductive. Tucker is aware that, unlike white radicals, "those who grew up in the ghetto and know the realities of police repression find little purpose or catharsis in provoking violence, in engineering confrontations, in baiting cops" (p. 145).

Tucker and Peeks know that there is no single or simple solution to the complicated, deep-seated problems facing black Americans. Both authors recognize that the black minority must develop and implement a wide variety of flexible strategies in order to achieve liberation. They see strong political organization and wise use of the ballot as a vital avenue to real power. And both agree that blacks, operating from a position of organized strength, must form coalitions with other minorities and elements of the white population.

ROBERT E. MARTIN

Howard University

The Politics of Economic and Human Resource Development. By Randall B. Ripley. (Indianapolis/New York: The Bobbs-Merrill Company, Inc., 1972. Pp. 184. \$8.00; \$3.75, paper.)

The Politics of Economic and Human Resource Development is the fifth book in the Bobbs-Merrill policy analysis series edited by Thomas R. Dye. These volumes all claim to offer original theoretical formulations in the emerging field of public policy. Ripley, professor of Political Science at Ohio State University, erects his own "analytical framework" on the premises of "systems theory" as elaborated by David Easton and by other scholars who have favored its constructs and metaphors. This framework he applies to four brief case studies of programs in the area of economic and human resource development: the Economic Development Administration, the Job Corps, Model Cities, and Appalachian redevelopment (through the Area Redevelopment Administration and the Appalachian Regional Commission).

Its chief merit lies in its assembling materials on the legislative politics, the implementation, and the social effects of each of the four program packages. Its corresponding defects, however, are that the legislative histories are dull (we are spared, it seems, the account of not even one roll-call vote), that the accounts of program implementation are superficial, and that program evaluations are unsophisticated—and occasionally credulous.

It is to Ripley's credit that the analytical framework is explicitly developed and consistently applied to all four case studies. Unfortunately, the propositions entailed by the framework are so abstract as to be either trivial or meaningless (e.g., "Policy process variables figure importantly in the production of policy statements" [p. 14]). Their application to the empirical materials is therefore arbitrary and unilluminating. For example, one of the four "policy process elements [which] emerge as particularly important" regarding the Job Corps is that "Job Corps officials agreed: that their primary goal was to help enrollees become employable in decent-paying jobs" and also that "their mission involved not simply subsidy but the manipulation of job opportunities and the redistribution of useful skills" (p. 90). Even if it were clear what exactly is meant by "the redistribution of useful skills," it would still not be obvious why these facts are "policy process elements." Nor is there any explanation why they rank among the four "particularly important" such elements in the history of the Job Corps.

Another peculiarity of Ripley's framework is that "policy results" include *statements* as well as actions and outcomes. Hence we learn that one of the three Job Corps "results" was that

"societal policy statements were expansionist throughout the Johnson administration" but more restrained under Nixon.

Ripley's lack of success with the development and application of analytical frameworks puts him in company with most other scholars who have essayed the same task. What is perhaps unique to the effort under review here is that its shortcomings are especially evident owing to Professor Ripley's commendable wish to take his own framework seriously enough to use it explicitly and consistently.

EUGENE BARDACH

University of California, Berkeley

Federal Service and the Constitution. By David H. Rosenbloom. (Ithaca: Cornell University Press, 1971. Pp. 267. \$8.00.)

Government employment has increased sharply in the last decade: from 8.4 million in 1960 to 12.9 million in 1970. This growth, coupled with persistent and vocal demands for the provision of steadier and better government service, and the increased activity and militancy of public employee unions, has brought many of the problems of federal, state, and local employment into the public eye. Mr. Rosenbloom's book, therefore, is welcome. It is a well-written and easy to read sketch of the federal employment relationship from the beginning of the Republic. It is, however, no more than this, and accordingly, it will be of little value to the political, historical, or legal scholar.

Rosenbloom traces the growth of the federal service from 1776, through the spoils system, the reform movement and the development of the modern civil service. His is a straightforward and accurate presentation, but it lacks the rich texture of good historical writing. The facts fail to sparkle, for they are not mounted in their social or political setting. Nor is there the narrative drama that fixes events in the reader's mind.

The author's principal concern, however, is not with history. He is interested in "the constitutional relationship between the citizen and the state in public employment." His approach to this relationship is set forth in the book's introduction.

The relationship is most usefully thought of as the degree of differentiation between the constitutional rights of citizens when in or in application for, and when out of or not in application for, public employment. The concept of such a relationship is intended to comprehend the distinction between citizens in public employment and others with respect to the ways in which the state may legitimately

act upon the constitutional rights of one or the other, but not both. Therefore, the relationship can take two general forms. It is nondiscriminatory when the roles of citizen and public employee are thought to be entirely compatible and there is no differentiation between the constitutional rights of citizens which is dependent upon public employment. The relationship is discriminatory when the roles of public employee and citizen are not believed to be wholly compatible and differentiation of constitutional rights is dependent upon the fact of public employment. The relationship is negatively discriminatory when the constitutional rights of public employees are subject to greater restriction and it is positively discriminatory when they are afforded additional constitutional rights. It is logically possible for the relationship to have positive and negative elements at the same time and for those elements to balance each other to cause a neutrally discriminatory relationship (pp. 1-4).

Armed with this analytic tool, Rosenbloom examines the federal service and finds that, during most of its history, the public employee has suffered negative discrimination. He has, as a condition of his employment, been forced to surrender some of the freedoms—speech, privacy, association, etc.—that he otherwise would have enjoyed. The trouble with this analysis is not that it is wrong, but rather that it is incomplete. It tells the reader nothing about the comparative intrusions on individual freedom suffered by employees of private employers. Of course, the Bill of Rights and the Fourteenth Amendment do not apply to the private employer, but that is not a sufficient excuse for the book's incompleteness. Consider, for example, the editorial writer who loses his job because his views differ from those held by his employer. Is he not in the same unhappy position—i.e., unemployed as a result of the opinions he holds—whether his employer is the government or the *New York Times*? I do not mean to suggest that the law should treat the private and public employee the same (that was Holmes's mistake in the policeman case). I do mean to suggest that neither the law nor its critics are free to ignore the comparison.

Moreover, Rosenbloom's examination of the case law in such areas as loyalty/security or employee political activity is pedestrian. All of the constitutional and statutory decisions he addresses have been better analyzed elsewhere; yet this analysis is not satisfactory. There remains important work to be done. Take, for example, the question whether political neutrality can constitutionally be imposed upon a public employee. The issue in part is whether such an imposition violates the employee's right of free association. Surprisingly, we know little about

that right. Is it mainly instrumental as Tocqueville argued, "a necessary guarantee against the tyranny of the majority"? If it is, then its reach must be judged in terms of the goal it seeks to serve. And that goal—preventing the tyranny of the majority—may well be furthered by the political neutrality of public employees rather than by their active involvement in the political process. If, on the other hand, the right of free association is seen as desirable in itself (and quite apart from whether it furthers a separate societal goal), the power of Congress to restrict the political activities of federal employees may, indeed, be meager. I suspect Tocqueville's vision is correct, but I am far from sure. I am sure, however, that Rosenbloom has not illuminated this or the many other hard legal problems touched upon in *Federal Service and the Constitution*.

HARRY H. WELLINGTON

Yale University

Prophet in Politics: Henry A. Wallace and the War Years, 1940-1965. By Edward L. Schapsmeier and Frederick H. Schapsmeier. (Ames, Iowa: The Iowa State University Press, 1970. Pp. 268. \$8.95.)

Prophet in Politics is the second half of a two-volume biography of Henry Wallace by Edward and Frederick Schapsmeier, professors of history. The first work covered the agrarian years, 1910-1940, and this effort completes the project. Beginning with the period shortly before World War II and concluding with Wallace's death in 1965, the authors examine Wallace with affectionate accuracy in his roles as wartime administrator, diplomat, cabinet officer, presidential candidate, and agricultural scientist. With less objectivity and frequent apology, they recount his activities as critic, maverick, and polemicist.

The Schapsmeiers have combed most of the relevant manuscript collections and have also corresponded with or interviewed scores of people who had political relations with the former Vice-President. Thus their book is likely to be the standard source on Wallace for some time. It is thoroughly documented (more than 500 footnotes) but written in a somewhat labored and frequently didactic style. In addition, the Schapsmeiers are uncritically fond of their subject. They picture him as a fervent idealist, totally dedicated to God, world cooperation, and humanity. If Wallace had the driving ambition, selfish thoughts, or partisan motives most men need to reach the threshold of the presidency, it is well concealed from the reader. His miscalculations and political errors often are blamed

on innocence, candor, noble objectives, or on others who misled him. The authors seem determined to protect Wallace—even from himself, and even when he doesn't need it.

Wallace was in many ways an admirable though perplexed man. He was an extraordinarily religious person who endorsed World War II, but found the Cold War irrational and unconscionable. He was a trusting, almost naive, leader in a world of pragmatic heads of state determined to maintain and aggrandize their power. He was a propagandist for peace oblivious to the need for a base from which to operate, and a leader of the moderate Left without quite comprehending the significance and responsibilities of his position. As a politician, he was evidently insensitive to the machinations of the men around him. As an agricultural scientist, he was not always perceptive of the complex relations between science and religion, science and war, and science and world affairs.

For the most part, the authors stick closely to Wallace's activities with little analysis of the larger political environment in which he moved. The rift with Truman over foreign policy is well described, but the discussion of the election of 1948 is an egregious example of the lack of extended treatment one would hope to find in a definitive work. Too much of the brief discussion of Wallace's presidential candidacy is spent defending his inconsistencies and explaining how he was duped by the Communists and fellow travelers. Surely Wallace was a victim of his own compulsions and ideals as well as of those with whom he was associated in the late 'forties and early 'fifties. Old liberal friends deserted him in his third-party candidacy, and his long and distinguished service to the nation was depreciated. Yet, in perspective, many of his principles were sound. His positions on Russia, the Cold War, and world cooperation hardly need exoneration today.

Henry Wallace was a deeply spiritual public figure who crusaded for his conception of what was good for humanity. As a politician, philosopher, and scientist, he was only partially successful, but this informative and compassionate biography, more descriptive than analytical, fails to completely explain why this was so.

DONALD BRUCE JOHNSON

University of Iowa

Budget Innovation in the States. By Allen Schick. (Washington, D.C.: The Brookings Institution, 1971. Pp. 223. \$6.95.)

There have been several efforts to reform budget procedures during this century. Ranging

in time from President Taft's Commission on Economy and Efficiency to President Johnson's efforts to spread Planning-Programming-Budgeting throughout the federal establishment, the reformers have sought to stretch the concern of budgeters beyond the narrow realm of financial control. Most proposals would recast budgeting to emphasize information about the details of programs and the goals of policy. Unfortunately, few of the reformers or their critics have tried to maintain consistency of terminology. The contemporary student of budgeting who would try to place present efforts in the perspective of the past must first wrestle with several meanings of "performance budgeting," "program budgeting," "fiscal control," "management," and "planning."

Allen Schick of Brookings does a creditable job of sorting out the history of budget reform in the United States and offers a standard vocabulary that seems to have a proper place for each major thrust: into would-be uses of the budget that stress "control," "management," or "planning." "Line-item" budgets serve control purposes, while "performance" budgets represent the demand for improved management of resources. "PPB" is a mixture of several orientations, with policy-planning dominant. Dr. Schick describes the complexity of PPB as a source of some problems. He argues that it is more a plastering together of different components than tightly integrated system. Its components—and their labels—promise different things to different people, who then work at cross-purposes while they seek to implement their views of PPB. Throughout the book, the author relates his tale of budgeting to the larger political process: what perspectives characterize various participants in budgeting (administrator, central budget office, chief executive, legislative), and how each component of a reform has brought support, opposition, or apathy from various actors.

It is no fault of the author that the book came out only shortly before the Nixon Administration announced the end of PPB and its replacement with yet another scheme. We must wait for the next summary treatment of budget reforms—or perhaps an article by Allen Schick—to understand how much form or substance lies within this recent change; and what it tells us about the preferences or capacities of government budgeters.

This book attempts to integrate description and analysis of budget reforms in the national government with descriptions of budget reforms in the states. Yet the allocation of space in the seven chapters does not match the prom-

ise of the title. The first two and the last two chapters deal with budget reforms in general—almost exclusively with events in the national government—while most of the middle three chapters deal with the states. Yet while Chapter 4 is labeled “The Status of PPB in the States,” it offers little information specific to the states; most of it could pass as commentary on the problems in adopting PPB by federal agencies.

The states are slighted not only in terms of the quantity but also of the quality of the attention devoted to them. Budget reforms in the national government are broadly and convincingly analyzed in as complete and attractive a discussion of budget reforms as any I have seen. Schick takes to task both the most optimistic of the reformers and the most caustic of the critics; he identifies some goals that seem feasible as well as some features in the structure of budget making that discourage certain greater hopes. In his conclusion Schick suggests some tantalizing—although briefly described—alternatives that might appear in the next rounds of reform.

The material on the states is disappointing. There is little effort to relate material on changes in budgeting to the different modes of state politics and policy making. Implicitly and occasionally explicitly we read that budget reform begins in Washington and comes later and piecemeal to the states. Yet we read that at least three states adopted components of PPB before many of the federal agencies did. We do not learn why some states adopt the reforms more quickly or thoroughly than others; we find no detailed explanation or assessment of PPB couched in the context of state politics or economics. Schick offers simplistic descriptions of changing budget procedures in a few of the states, sandwiched between cogent analysis of budgeting in the national government. There is scarcely a word about the states in the final two chapters that offer some theorizing about budgeting. His descriptive chapters on the states do not seem to inform his analysis of what happened in the recent flurry of budget reform, or what changes in procedure may hold on after the flurry subsides.

The combination of meaty treatment of national affairs and lackluster treatment of the states is confusing and unfortunate. Schick knows enough about budgeting to deliver better on his promise to write about budget innovation in the states. He buries much good material on budgeting in the national government in a book that is made unsatisfactory by its alleged focus on the states. This reviewer's advice is to scratch the second half of the title, and to

read Chapters 1, 2, 6 and 7. The result is a good book.

IRA SHARKANSKY

University of Wisconsin, Madison

American Communism in Crisis, 1943–1957.

By Joseph R. Starobin. (Cambridge, Mass.: Harvard University Press, 1972. Pp. 331. \$12.95.)

Except for the pre-World War I Socialist Party, the American Communist Party was between 1938 and 1948 the largest and most important radical or revolutionary movement in American history. One might even make a case for giving first place to the Communists on the basis of their greater discipline and internal cohesion as well as their more extensive field of influence. Individual Communist party members spent more time and energy for the party than did individual Socialist party members; many Communist sympathizers and fellow-travelers were the equivalent of Socialist party members in their service to the party.

In any case, scholarly interest in the Communist movement has been far less than its relative importance would warrant. Much more attention was paid in the nineteen-sixties to the I.W.W. than to the Communists, no doubt because the radical mood found the I.W.W. more sympathetic politically or emotionally. Serious study of the Communists in their “middle period” in the nineteen-thirties has hardly begun and is now long overdue.

From 1930 to 1939, the Communist Party's membership rose from about 7,500 to at least 75,000 and possibly closer to 100,000. In 1948, the Party still claimed almost 70,000. It was able to overcome the two crises of the previous decade—brought on by the German-Soviet pact and the expulsion of its most successful leader, Earl Browder—without serious losses. But from 1948 on, it headed downwards; and as a result of the internal crisis which tore it apart in 1956–57, it became little more than another radical sect. It has succeeded in making a modest recovery in the past few years, but it is barely back where it was about 1932, without the same élan and momentum.

The questions that beg for answers are: Why and how did it rise in its period of growth? Why and how did it fall in its period of decline?

We now have the answer to the second question before getting one for the first. Roughly the same ground was covered in a previous book by Professor David A. Shannon, published in 1959. But Professor Starobin has had a dozen more years in which to gather material

and ponder it; he has also had the inestimable advantage of greater intimacy with the party's inner workings. In this field, it is invaluable to know where the political bodies are buried, and Professor Starobin, without writing an autobiography, has made the most of his personal experiences. His book supersedes everything that has been written on this period; it belongs with the few indispensable works on American radicalism in general and American Communism in particular.

The main fascination of Professor Starobin's story is that it shows in fine detail how a radical or revolutionary movement can try to commit suicide at the same time that an attempt is being made to murder it. Without its own suicidal tendencies, the victimization suffered by the Communists in the McCarthy period would probably have hurt the party to a considerable extent, but it could never have done as much damage as the party did to itself. There was far more official violence against Communists during the depths of the depression, but it did not stop them from tripling their membership between 1930 and 1933.

Professor Starobin has written the definitive account of the Communists' self-inflicted wounds. On the assumption that a cyclical economic crisis, on the order of the depression of the early 'thirties, together with a Soviet-American war were imminent, the Communists began to make preparations to go "underground" as early as 1947, some time before Senator Joseph R. McCarthy began to do his dirty work. These apocalyptic expectations did not prevent them from taking part in—and taking apart—the Wallace movement the following year, an intermezzo of opportunism for which they paid dearly by being forced to break with the larger labor movement. The Communist aspect of the Wallace movement has never been dealt with more clearly and subtly than by Professor Starobin. Nevertheless, the party was apparently able to hold on to most of its *cadres* and a large part of its postwar membership until 1951, the crucial year in Professor Starobin's account. The most striking section of his book tells how the party leaders decided to go "underground," to conduct a witch-hunt inside the party that would have made Senator McCarthy suffer torments of envy, to shatter far more Communist lives and dismantle far more of the party's organizational machinery than all the congressional committees and volunteer Communist-hunters were capable of doing. Nikita Khrushchev's "secret speech," the Polish uprising, and the infinitely tragic Hungarian revolt, all in 1956, came as shock waves hitting a party that was

already diseased and demoralized. Those who think that McCarthyism was mainly responsible for the American Communist Party's undoing in the nineteen-fifties are especially advised to read this book.

Professor Starobin's conclusions are in part somewhat less satisfactory. Throughout his book, he shows how the American Communist leaders looked to Moscow for inspiration and even tactical guidance, despite the official dissolution of the Comintern in 1943. The following year, Browder sent to Moscow exactly those party documents which Jacques Duclos used against him in 1945. Starobin himself went on a mission to Moscow in 1951 to find out what the Soviet leaders thought about matters that struck him as "almost entirely technical" and "insignificant." Steps were taken to insure continuing contacts. Nevertheless, Professor Starobin writes: "All the evidence suggests that the C.P. leaders never really *knew* what either the Soviet Union or the international movement wanted of them—except for them to keep in step at every turn" (p. 231). This is a most peculiar exception. Was it not enough for the American leaders to know that much in order to know what the Soviet Union or the international movement wanted of them?

One need not agree with every nuance or interpretation in this book to consider it, as I do, a major contribution in this field. No one who wishes to understand what happened to American Communism can afford to ignore it.

THEODORE DRAPER

The Institute for Advanced Study, Princeton, N.J.

The Institutionalized Presidency. Edited by Norman C. Thomas and Hans W. Baade. (Dobbs Ferry, N.Y.: Oceana Publications, Inc., 1972. Pp. 239. \$8.50.)

The American presidency is in "a constant state of flux," and it is therefore necessary "to reappraise the presidential office with a view toward developing a new set of perspectives for the 1970's" (p. 1). With reappraisal as their theme, Thomas and Baade have collected nine articles whose unity lies in their examination of the presidency as an ongoing institution rather than as the instrument of any one incumbent. The collection includes a number of worthy articles: Joseph H. Kallenbach on the hidden implications and unforeseen results of constitutional amendments relating to the presidency; Harvey C. Mansfield on different approaches to reorganization of the executive branch and their reflection of the differing political objectives of the president and Congress; Marver H.

Bernstein's history of the failure of attempts to improve management of the executive branch; Allen Schick's history of the failure of the Bureau of the Budget and a tentative assessment of the Office of Management and Budget's potential; Norman C. Thomas's overview of the sources of information available to the president and the limitations of each; and Hans W. Baade on West Germany's examination of its own executive, with possible implications for the American presidency. Three articles, however, are of particular interest.

The first, by David L. Paletz, presents an overview of the literature on the presidency and classifies it according to the different perspectives of the authors. This in itself is useful; far more significant is the way Paletz utilizes his material to show that trends in political scientists' approaches to the presidency mirror changes in the ideology of the political activists with whom the writers identify. Paletz suggests that writers tend to react to the most recent incumbent in formulating their theories, and that the theory accorded orthodoxy at any given moment is directly dependent on the dominant political values of the time. If he is correct, the next spate of theories should mix post-Johnsonian reaction (the president has too much unchecked power in foreign affairs and should consult with Congress before acting) with post-Nixonian reaction (the president has a chance to score great unilateral coups in foreign affairs and should pay more attention to the domestic needs of the people). The inevitable contradictions in the reactions should inspire commentators to ask whether they might not eschew formulating their theories backwards (i.e., deciding what they disliked about the last president and adjuring all future Chief Executives to do otherwise) and turn instead to a more abstract consideration of the extent and kinds of power any president and any Congress should have if the constitutional system is to function properly. A first step, of course, is deciding what "properly" means, which brings us to the next article of significance.

Senator Walter F. Mondale's article is a defense of his proposed bill to establish a Council of Social Advisers in the Executive Office. Its purpose would be to maximize full social opportunity for all Americans through improved social policy making. Mondale's dual assumptions, therefore, are that the ultimate purpose of the constitutional system is equality of opportunity, and that further institutionalization of social scientists within the executive branch would rationalize the social policy-making process. The merit of Mondale's first assumption is

matched by the naivete of his second. There are social scientists and there are social scientists, and one might wonder in what way the contributions of those like Schlesinger, Moynihan, and Kissinger—not to mention the warriors of the abortive War on Poverty—have extended equality of opportunity. It is interesting to note, however, Mondale's third implicit assumption, which is that overall planning for social justice must of necessity originate in the executive branch. Thus, along with the political scientists represented in the volume, Mondale appears to believe that the presidency is destined to ever greater size and power and that the only questions remaining are those of organizational design. (President Nixon's pre-Watergate personnel shifts, which were in effect an attempt at reorganization, indicate that he, too, accepts this premise.) Mondale here reflects the majority of his colleagues in Congress, who can usually be counted upon to give their all in the fight to render their institution as impotent as possible.

The most impressive essay, destined to become a classic in the field, is Thomas E. Cronin's "Everybody Believes in Democracy Until He Gets to the White House . . .": An Examination of White House-Departmental Relations." Cronin is concerned with the "gap" (p. 147) between the President's function of formulating policy to meet the nation's needs and that of running the bureaucracy in the implementation of such policies. The particular problem he examines here is the relationship between the bureaucracies of the White House and the Cabinet departments, and the technique he utilizes is the summation of interviews with forty-three recent White House Staff members. Cronin explores the extent and nature of the built-in conflict between the two bureaucracies; the consequences of the blurring, by Kennedy and Johnson, of the distinction between staff and line functions; the tendency of activist presidents to try to do too much too fast (which leads the reader to wonder whether the presidential term should be extended or whether the functions of the presidency should or can be more limited); the different time perspectives of the departments and the White House staffers; and the results of retaining the implementation function by the department bureaucrats even while they share the policy-making function with the staff. (It should be noted that President Nixon apparently attempted to solve the problem of the conflicting bureaucracies by substituting his own loyal appointees for the traditional career bureaucrats in the jobs of Assistant Secretary for Administration

in the several Cabinet departments.) Finally, in an excellent section on the Cabinet, Cronin supplements and updates Fenno (*The President's Cabinet*, 1959), and suggests a discernible difference in power between the "inner" and "outer" Cabinets.

The wealth of material contained in the essay is extraordinarily useful, but even more impressive is Cronin's blending of empiricism with analysis. He has never fallen prey to the fallacy that an empiricist must not think and evaluate both quantitatively and normatively, and the conclusions he draws about the implications of his material are of the utmost value. He notes that the conflict between the bureaucracies is a fluctuating and highly differentiated entity, varying with such factors as the personnel in each, the policies which are important to the president at any given moment, the kind of function performed by each aide (domestic policy, budget problems, congressional relations, etc.), and the styles of the various presidents. He concludes, in part, that the conflicts between the bureaucracies should be categorized according to their appropriateness in a democratic system and that certain kinds of conflict should be encouraged. This applies particularly to those conflicts which will generate information and alternative policy choices for the president.

This is a volume devoted to the question of how the presidency should operate rather than what the president should do. Since, as indicated by Watergate, organization tends to define the parameters of possible action, the question is an important one. The value of the book is that it will undoubtedly stimulate consideration of the various possibilities for organizational reform, and, one hopes, the potential effect of reform on policy.

PHILIPPA STRUM

Brooklyn College, City University of New York

The Third House: Conference Committees in the United States Congress. By David J. Vogler. (Evanston: Northwestern University Press, 1971. Pp. 133. \$6.50.)

It would be hard to overestimate the importance of congressional conference committees, and for that matter, the difficulties involved in researching this crucial stage in the legislative process. One reason for both the importance and the difficulty is that the conference committee is, in the late Congressman Clem Miller's terms, "the ultimate flowering of the power of seniority." The senators and representatives who meet to reconcile and sometimes

go beyond differences on legislation between the two houses are almost inevitably the ranking committee and subcommittee members, majority and minority. By definition these are busy men, hard to gain access to, difficult to get them talking about what happens. Some other phases of the legislative process, like marking-up a bill, also take place behind closed doors, but most of the give-and-take of conference committee decisions seldom becomes public—the reports, themselves, and the debates which follow may cover up more than they reveal. For all of these reasons as well as the sheer range and variation of activity (something like ten per cent of all legislation passed goes to conference, including nearly all major bills) this "end game" remains one of the most fascinating but least understood phases of the legislative cycle.

Thus, it was with some anticipation that I looked forward to reviewing Professor Vogler's tight little monograph on *The Third House*. By and large, he builds well on the thin literature focusing upon conference committees: the "classics" by McCown (1927) and Steiner (1950), isolated findings from legislative case studies from Bailey (1950) to Paletz (1970), and generalizations from the committee-centered research of Fenno (1966), Manley (1970) and others. One intriguing question—why is it that almost all of this literature, with the exception of Fenno, grows out of dissertation research?

Vogler opts for aggregate analysis of many cases (all conference decisions taking place over five Congresses, 79th, 80th, 83rd, 88th and 89th, $N = 596$) rather than an intensive case study approach. Thus, he bypasses the problem of interviewer access altogether. Indeed, there is no explicit evidence that he interviewed any congressmen or staff about the process. Still, his careful qualitative analysis does provide a number of useful generalizations beyond Wilson's earlier cryptic dismissal of conference committee activity as "at best a haphazard method of compounding legislation, liable to suffer many singular accidents, and impossible for a busy people to understand when they occasionally look on with unwonted attention" (*Constitutional Government in the United States*, 1908, p. 107).

The author is interested in a number of questions: Who goes to conference, to what extent is the majority party over- or under-represented, is it the committee seniority or the subcommittee ranking which is likely to control, who wins as between the two houses and their related pairs of committees, and what form

does conference bargaining take? By the nature of the research mode he has adopted, Vogler tends to provide more satisfactory answers to the first three questions, gets into greater difficulty with the latter two. His analysis is primarily based upon public documents: the language of conference reports, debates in the *Congressional Record*, committee membership and rankings from sources like the *Congressional Directory* and *Congressional Quarterly Weekly Reports*.

For answers to the question of "who wins," he turns to descriptions from *Congressional Quarterly Almanacs*: "in most cases the House prevailed"; Senate conferees conceded to the House version . . . ;" and so on. It is on the basis of 297 such judgments favorable to one house or the other that Vogler makes his case. Regardless of whether or not one shares Richard Fenno's observation that "the central question of conference committee decision making is 'Who wins?'," it remains quite unsettling to rely on judgments about the dependent variable at least two steps removed from the language of the conference committee reports, let alone research into how the participants perceived the outcomes. The question of "who wins, who loses" is never easily answered, even when it is a matter of reconciling differing dollar amounts. All too often a majority of Senate conferees may yield on a number of amendments in order to obtain House conferee approval for one section which they deem critical. In fairness to Vogler this kind of detailed evaluation can seldom be extended beyond three or four pieces of legislation in any one Congress. Still, if one believes that the questions of "how" and "why" and "with what consequences for whom" are at least as important as "who wins," then he is likely to come away from Vogler's analysis feeling more than a little troubled.

Vogler's next to last chapter is an attempt to apply theories of formal organization and bargaining to conference committee activity based on overviews of 34 of the more conflictful cases scattered over the five Congresses. Although the theoretical refinements are suggestive, their integration with data is, at best, marginal—an occasional quote from the *Congressional Record* or the *Congressional Quarterly Almanac*. Outside influences on conference committees—the executive branch, interest groups, and constituency influences—get all of a page and one-half! Despite this monograph's limitations, and they are sometimes severe, the author has made several contributions. He has ordered the literature, outlined some the parameters for the study of conference commit-

tees, and developed some useful generalizations about who participates, if not necessarily who wins. As the author himself concludes: "What we have learned about conference interaction palls in comparison to what must be learned . . ." (p. 113).

ROBERT L. PEABODY

The Johns Hopkins University

AKEL: The Communist Party of Cyprus. By T. W. Adams. (Stanford: Hoover Institution Press, 1971. Pp. 284. \$6.00.)

This is the first detailed work published in English on the Communist party of Cyprus. Professor Adams's study grows out of his long and persistent interest in the political affairs of Cyprus, as indicated by his two previous publications on Cyprus: *U.S. Army Handbook for Cyprus* (1964), and (as co-author) *Cyprus Between East and West* (1968). In the introduction to his work on AKEL, the author expresses his concern that "much of what is written about the party comes from polemicists and journalists who are strongly biased" (p. 1). Although Adams shows that he has undertaken long and arduous research in order to complete this volume, it cannot be considered a definitive work on this subject.

The general tone of the book tends to be polemical. From the very beginning, specifically in his preface (p. x), Adams engages in a polemic against Mr. Papaioannou, the leader of AKEL, in which Adams justifies the objectivity of his two previous works on Cyprus. The book is replete with sweeping generalizations about the character of AKEL's leadership, many of which are unfounded. For example, Adams states "AKEL is still a sleepy party ruled by an insecure and unimaginative group of old men" (p. 9). In another place, he describes the leadership of the party as "AKEL careerists" (p. 201), by which the author implies motives of opportunism that he does not satisfactorily substantiate. If one accepts Adams's characterizations about AKEL and its leadership, one finds it difficult to understand how this very party gained the highest proportion of votes cast in the 1970 Cypriot Parliamentary Elections (40 per cent), a fact which the author reports in the book's postscript (p. 205). One would have to admit that the Communist leadership in Cyprus must have been doing its homework very well, indeed.

I agree with Professor Adams that AKEL does not presently exhibit the dynamism it showed during its formative years, especially during the 1940s and early 1950s. This, however, has not minimized its influence. AKEL did en-

counter difficulties for its neutrality during the E.O.K.A. armed struggle in 1955. On this point, concerning AKEL's miscalculations at that time, the author handles the analysis well, especially in his historical presentation in Chapter 1 and in later references (pp. 59, 117). AKEL's miscalculations notwithstanding, I believe that the author misses an important point regarding AKEL's influence among the Cypriots (Greek-Cypriots). He fails to account for, as well as analyze, the fundamental fact that AKEL represents an ingrained and stable social force in Cyprus. The party's popular appeal among the Cypriot masses has to be seen in connection with its major contributions in the labor movement, and its impact thereafter in the elevation of the Cypriot working class. One cannot be expected to understand AKEL's influence in Cyprus without analyzing it as a distinct social force.

In some areas of the book, a number of points deserve a more detailed discussion. For example in chapter 4, entitled "AKEL's Conflict and Integration with the National Environment," Adams gives an inconclusive analysis of the character of the other political forces in Cyprus. A good in-depth discussion on EDMA and its successor, The Patriotic Front, would have shed light on the understanding of the "New Political Parties in Cyprus" (p. 147). In another instance, one would have to go a bit far to call EDEK a Socialist Party—a better characterization would describe it as having a program with strong "socialist" tendencies.

The chapter on "The National Environment" (Chapter 3) is rather weak, specifically the presentation on the "Greek-Cypriot Ruling Structure," the "Esoteric Tendencies of the Cypriots," "Socio-Economic Structure," and "Greek Social Structure." The analysis of these topics is too general.

Two final strictures: A number of weaknesses could have been avoided if the author had not relied so heavily on translations; and an opinion survey of the rank-and-file membership of AKEL and PEO would probably have yielded a more critical understanding of the subject matter of this book.

STANLEY KYRIAKIDES

The William Paterson College of New Jersey

Documents of the History of the Communist Party of India, Vol. One, 1917-1922. Edited by G. Adhikari. (New Delhi: People's Publishing House, 1971—distributed by South Asia Books, Columbia, Mo. Pp. xxiv, 640. \$6.50.)

Communism and Nationalism in India: M. N. Roy and Comintern Policy, 1920-1939.

By John Patrick Haithcox. (Princeton: Princeton University Press, 1971. Pp. xiv, 389. \$12.50.)

During the past few years the Communist movement in India has attained a degree of respectability and influence that was noticeably lacking earlier. At the state level, leaders of the two major communist parties (the Communist Party of India, or CPI, and the Communist Party of India-Marxist, or CPM) have become Ministers and patron-wielders. At the national level the CPI has gone into alliance with the Congress party, in such a way that its leadership is now being consulted fairly frequently by both state and central governments. Moreover, Prime Minister Indira Gandhi apparently decided after the Bangladesh crisis of 1971 that India's north wind must prevail over both its east and west winds, with the result that she has surrounded herself with a number of former and present pro-Moscow communists as advisors, and they are presently engaged in a collective attempt to lessen India's dependence on the West while countering those Chinese thrusts in Asia that do not parallel their perceptions of the interests of India.

Having gained respectability and influence, both of India's communist parties (CP's) have begun to use their fairly elaborate research and publishing wings to write party histories. Aside from the ego-satisfaction that can be derived from such an endeavor, there are also practical reasons for this phenomenon. Since the split in the united CPI in 1964, both the CP's have found it necessary to rewrite history according to their own current tactical and strategic lines. Then too, both CP's have an aging leadership (the average age of the top committees in both parties is mid- to late sixties), with the result that the "old-timers" feel some compulsion to have things written down *their way* before they pass from the scene.

Dr. G. M. (known to his party comrades as "Doc") Adhikari's collection is the first in a series of sourcebooks, officially approved by the CPI, and it is intended as "basic documentary material" for "an authoritative history of the party" (p. vii). Although the book was originally designed to cover the period 1917-1925, the author found that nine years of Indian communist documents would be too much for one volume, so the present effort is restricted to only six years (1917-1922). In addition to the documents reproduced, more than a hundred pages of introductory and explanatory notes by party historian Adhikari tell the reader what he

(Adhikari) thinks should be learned from them.

There are several problems with the documents: (1) letters and communications to and from leaders of the present CPM—some of whom (such as Muzaffar Ahmad) were especially important in the formation of the united CPI—are missing; (2) many of the “documents” are extracts or excerpts of longer letters, newspaper articles, or pamphlets, edited by Dr. Adhikari on the basis of what he thought was most important; (3) the volume by no means contains a complete listing of even the most important documents of the period (Adhikari complains that he could not get the full cooperation of the Government of India’s central intelligence department, which has copies of many of the documents this volume lacks); and (4) many of the documents—such as the excerpts from M. N. Roy’s writings—are available in more complete and accurate form elsewhere. To be sure, there are some interesting things here, but one is struck by the fact that they were all written originally in English, which means that many of the indigenous Indian sources on communism during this period are completely neglected.

Dr. Adhikari’s introductory notes may be valuable to someone who is trying to fathom the minds and tactics of pro-Moscow Communist-wallahs in India, but they are of little use for anyone trying to understand the position of the Communist movement in its Indian environment. Adhikari describes the period 1936–1947 as the time when “the party develops into a mass political organization on an all-India basis” (even though at present his CPI gets about 5 per cent of the national vote by appealing to certain regions and communities, but is essentially without a “class” base). During the period 1954–1964, Adhikari argues, “the party emerges as the leading opposition party,” a rather hollow claim in a situation where the CPI has been outpolled by other opposition parties in almost every state and national election since India’s Independence in 1947.

Both Dr. Adhikari and Professor Haithcox do point up the way in which pro-Moscow Communists have historically been concerned with attempts to penetrate the ranks of India’s nationalist leadership. Indeed, Haithcox justifies another in a long series of books on M. N. Roy by pointing to the “new material” he has collected on Roy’s relationships with Lenin, with Congress party leaders in India, and with the Congress trade union movement. Through the eyes of Haithcox, Roy is seen hobnobbing with

Lenin and other international Marxists, walking the villages with Nehru, being defended by the Congress “High Command” when the British arrested him, and, through his writings and activities, influencing the course of nationalist politics particularly in the 1930s. There is indeed some new and valuable material here, and Professor Haithcox has emphasized facets of Roy’s life that usually receive less emphasis.

Professor Haithcox quotes without comment from a British intelligence estimate in the 1930s (reported by Roy himself, in a letter to Louise Geissler) to the effect that Roy was “the only man who could make communism a real danger in India” (p. 197), and that Roy “stands out heads and shoulders above all other Indian communist leaders with the possible exception of Dr. G. M. Adhikari.” There is little in Haithcox that would confirm such an estimate, indeed, there is a good deal that would make one seriously question it. Haithcox rejects the argument that Roy’s failure to rally India’s left wing behind him in unity during the 1930s could be attributed to “inordinate ambition,” instead arguing that Jayaprakash Narayan “came closer to understanding the reason for failure” when Jayaprakash pointed to “the ridiculous idea held by every miserable little party [including Roy’s] that it alone was the real Marxist Party, and that every other party had therefore to be exploited, captured or destroyed” (p. 237).

If Roy was a factionalist first—and at various times in his life a nationalist, Communist, socialist, or radical humanist second—then Haithcox has certainly captured the spirit of “Royism.” On the basis of a wide variety of primary and secondary sources Haithcox traces out many of Roy’s factional maneuverings and modifications in his political philosophy, through which, in the judgment of Professor Haithcox, “runs one constant theme—the quest for human freedom and dignity—to which Roy devoted his entire life” (p. 299).

Two irritations make the Haithcox book unsettling to read. First, since it is primarily intended as a work that will fill certain gaps, it does not fit together in very systematic fashion, has no major themes that flow consistently through its pages, and sometimes shifts abruptly from subject to subject. Second, Princeton University Press not only resorted to the increasingly frequent publisher’s cop-out of putting footnotes at the end of the book, but it then tried to correct for the resulting clumsiness by scattering some of the more informative footnotes at the bottoms of pages. The result intensifies the reader’s feeling that he or she is sometimes being subjected to a field re-

searcher's unfinished notebook.

M. N. Roy was undoubtedly an enchanting character, and he perhaps wrote (while his followers provided for the preservation of) as much material as any man that ever lived. Although each of his comrades in the various Indian leftist movements has written less, the combined literary output of the Indian left is formidable. If only because Indian Communists are frequently so fascinating, have gained a degree of influence and respectability, and have so many of their letters, pamphlets, articles, books, novels, short stories, and other documents tucked away somewhere, we can rest assured that there will be many, many books like both of these.

MARCUS F. FRANDA

*American Universities Field Staff,
New Delhi, India*

Student Alienation: A Venezuelan Case Study.

By Robert F. Arno. (New York: Praeger, 1971. Pp. xxiv, 209. \$15.00.)

This case study of student alienation at the University of Oriente in Venezuela is very good. Some might argue that it is more social psychology or educational sociology than political science, but for the scholar interested in political socialization, political psychology, or political development in more general terms, this work has real merit. Unlike most case studies, the material presented here has general application, and the careful discussion of methodology employed is a real contribution for those who seek greater sophistication in carrying on this sort of research, in developed as well as emerging areas. Professor Arno has developed a sensitive instrument for measuring attitudes in an institutional setting, in this case testing for alienation in a university.

After an Introduction in which he discusses his general rationale and research plan, the author offers seven substantive chapters and a concluding summary. The substantive sections discuss such matters as the impact of university social structure on professional efficacy and upon political efficacy, the relationship between professional efficacy and political activism, student political involvement, and the concept of the efficacious student as modern man. In toto, the book offers a comprehensive picture of political activists in a provincial university whose students are recruited mainly from the poorer sectors of the population, comparing them with the alienated *universitarios*. Contrary to popular wisdom on the matter, Professor Arno finds that the Latin American student activist usually is academically successful, while the

more violence-prone alienated student tends to be fatalistic and politically passive, and somewhat less successful in his intellectual pursuits.

In terms of physical presentation this book probably is overpriced. It is short and has no index. The 146 pages of typed-offset text and 46 pages making up ten methodological appendices contain few maps or illustrations, and the tables also are typed. Even in this era of fantastic costs for book making, \$15.00 seems excessive. Considering the quality of the substantive contents, it is a shame that Professor Arno's work may be priced out of the general academic market.

ROBERT E. SCOTT

University of Illinois at Urbana-Champaign

The United States and the Trujillo Regime. By

G. Pope Atkins and Larman C. Wilson. (New Brunswick, N.J.: Rutgers University Press, 1972. Pp. 245. \$10.00.)

The Trujillo regime was one of the most cruel and harsh dictatorships ever to exist and is a perfect choice for a case study to demonstrate the dilemmas faced by the United States in dealing with nondemocratic governments. The policy of the United States toward Latin America is frequently criticized very severely, and Atkins and Wilson attempt to evaluate that criticism through careful analysis of the intricacies of United States relations with the Trujillo regime.

In an effort to make the study more than a historical-descriptive survey, the authors employ a "policy framework" model analyzing policy in terms of "policy objectives, policy instruments and techniques, and capability analysis" (p. 4). While the authors make an elaborate presentation of their analytical framework in the first chapter, the framework is not very rigidly applied in their analysis. Their analysis of United States policy toward Trujillo hinges on the conflicts between the nonintervention doctrine and promotion of democracy and stability in Latin America and particularly the Caribbean.

Despite the failure to apply the framework consistently, Atkins and Wilson present a very useful and interesting study. As they point out, it is the first study to cover the entire span of United States-Trujillo relations. Indeed, they review pre- and post-Trujillo relations with the Dominican Republic as well. The chapter on the post-Trujillo era is an excellent analysis of the problems created by the political vacuum which follows the overthrow of a well-established dictatorship.

The recurring theme of the analysis is that

the United States must recognize that its policy has to be adapted to differing cultures and experiences. The Latin American development experience is different from that of the United States, yet United States policy makers are often unwilling to accept the fact that political development can take forms different from ours. The authors' definition of political development seems to be "representative democracy," an indication that they may follow the same tendency for which they criticize the policy makers.

In attempting to evaluate the policy of the United States toward Trujillo the authors constantly ask whether it could have been any different, and if it had been different would the Dominican Republic have fared differently. They answer their questions by noting that the United States has to deal with political realities, and although it might want to promote democracy in Latin America, there are very real practical limitations to what it can accomplish. In effect, critics of United States policy are usually answered with a justification of the policy on the basis of political realities. As the authors point out, one of the political realities in their case study is that Trujillo was extremely shrewd in recognizing where his best interests lay—usually in strong alignment with the United States, at least until the late 1950s when the United States cooled toward him. Although the authors do raise some criticisms of their own, the major emphasis of the work seems to be on justifying United States policy rather than analyzing it. Nevertheless, the study does represent a great deal of in-depth analysis not previously available and the authors' technique of working in fascinating detail makes it a very interesting one as well.

The authors conclude that the United States has been largely unsuccessful in its policy of fostering democracy but that it has had other impacts on the area. They are particularly critical of the United States' tendency to view political development in terms of economic growth. The frequent Latin American obsession with economic development resulting in neglect of the development of political institutions may be attributed to the United States' unbalanced emphasis on economic growth.

The volume will be particularly useful to the student who wants a good review of the major United States doctrines in its Latin American policy. Particularly instructive is an analysis of the inconsistency in and the problems of defining the various policies. Also very helpful is the thirty-nine page bibliography which is the most complete available on the Dominican Republic.

The authors are successful in making this

case study what a case study should be—a lesson about some larger concern. They have made the Trujillo regime a good example of the dilemmas and embarrassment of the United States in dealing with dictatorial regimes while espousing democratic ideals. In addition they have demonstrated that there are many political limitations on the power of the United States to influence its neighbors, even though it would appear to have an imbalanced advantage.

N. JOSEPH CAYER

University of Maine, Orono

Bureaucracy and Politics in India. By C. P. Bambhri. (Delhi: Vikas Publications, 1971. Pp. 349. Rs. 36.)

Dr. Bambhri's thesis is that Indian institutional structures are insufficient to control the bureaucracy and that unless the political parties establish legitimacy and hegemony over the bureaucracy, it will continue to arrogate power to itself. His analysis is divided into two parts. The first is devoted to an exposition of the party system, the institutional controls of the Indian Parliament and the Prime Minister over the bureaucracy and the organization of the bureaucracy itself. The second half seeks to illustrate these theoretical relationships by case studies of T. T. Krishnamachari, M. H. Patel; Krishna Menon as Defense Minister; the Voice of America Agreement; Lal Bhadur Shastri's relationship to the bureaucracy; and the conflict between Gulzari Lal Nanda and L. P. Singh.

Indian political development has been characterized by the conversion of a nationalist political movement to a polarized party system. In the transition, the disappearance of symbolic leaders of the Independence movement, the re-emergence of local and regional political aspirations, the absence of a parity relationship between electorate and political leaders, and the slackening of momentum of developmental efforts, have pushed the crucial decision making upon the bureaucracy.

The author's characterization of the Indian Civil Service (ICS) as generalist, unresponsive, elitist, middle-class, and urban oriented does not fairly assess its contribution to nation building in the post-Independence era. A one-page analysis of the other classes of Indian civil service hardly does justice to their accomplishments in railway, transportation, health, and hydroelectric power development.

Students of Indian politics should carefully read the chapter on institutional control in order to understand the technical parliamentary maneuvering in dealing with the various issues which faced the nation.

Indecisive and second-rate political leadership factionalism, political defections, communal groups, the lack of meaningful social dialogue leading to national consensus—all result in the conclusion that the “bureaucracy is left free to accomplish whatever it sees fit” (p. 111).

The five cases studies offered display the various patterns of relationship which may emerge. They illustrate the following patterns:

(1) Strong supporting bureaucracy, strong political leaders, strong supporting party, strong opposition party attack (T. T. Krishnamachari—H. M. Patel).

(2) Strong opposing bureaucracy, strong political leader, strong supporting party, strong opposition within supporting party (Krisna Menon as Defense Minister).

(3) Strong bureaucracy, weak political leader, strong opposition party activity (agreement with Voice of America).

(4) Strong bureaucracy, weak political leadership, divided support within ruling party (Lal Bahadur Shastri as Prime Minister).

(5) Strong bureaucracy, weak political leadership, strong opposition from segments of ruling party and opposition groups (Gulzari Lal Nanda—L. P. Singh).

What disturbs this reviewer is the subtle innuendo that an administrative bureaucratic conspiracy against political leadership exists in India.

It must be stated here that bureaucracy is never indefensible. It operates the levers of power in a very subtle and anonymous manner. The fraternity of the ICS, when a brother ICS is attacked, tends to combine together and pulls the string in a subtle manner and reaches the highest echelons of political decision-makers (p. 251).

Ultimately a more evenhanded evaluation may be reached which will give the ICS greater credit for maintaining higher ethical values in government than would prevail if the English tradition of the bureaucracy did not persist. Innuendoes of conspiracy will be tempered by the realization that the power vacuum left by the British was filled in part by those who had experience in governing under well-defined standards, even though they may have also been elitist, western in cultural outlook, and generalist in orientation.

Temple University

Education and Politics 1900–1951: A Study of the Labour Party. By Rodney Barker. (Oxford: Oxford University Press, 1972. Pp. 173. \$10.25.)

Social critics from Matthew Arnold to Ray-

mond Williams have recognized the influence of education in determining class stratification in Great Britain. While the aristocracy and the newly rich segregated their children in public (i.e., boarding) schools, a state system of elementary education for the mass of the people did not develop until after 1870. If literacy was more widespread in England than in many parts of Europe, it was not universal until the end of the Victorian era. One might, therefore, expect the Labour Party to be preoccupied from its inception with educational reform as an essential instrument of social change. Yet, as Dr. Barker demonstrates in his study of Labour's attitude towards education between 1900 and 1951, the party consistently accorded the issue a low priority among its professed goals. Rarely in the vanguard of educational reformers, Labour politicians were content to adopt the remedies of other parties, endorsing those changes which promised to disseminate benefits more widely, but eschewing innovation. However much it aspired to a more egalitarian social order, in practice Labour adhered to prevailing elitist values, including the notion of education as a competitive contest in which only the deserving attained the prizes.

Labour's educational sights, the author contends, “were fixed on the top of the nearest summit” (p. 101). Thus in the early years of the twentieth century it aimed at nothing more than an extension of the opportunities provided by the elementary school and the concession of free places in secondary schools for working class children. Only after the introduction of universal secondary education in 1944 did the party begin to consider the social implications of private schools. Throughout the period Labour concerned itself not with the content or even the structure of education, but with its accessibility. Like wages or housing, education was regarded as a commodity whose distribution might be rendered more equitable, but whose basic premises were not in dispute. For Socialists, Barker suggests, “the problem was not to abolish the peaks of inequality, but rather to obliterate its troughs by massive improvements in the condition of the people” (p. 101). Such conflict as existed in Labour thinking was between those who wanted equality of opportunity, associated with unhindered access to the academically prestigious grammar schools, and those who sought equality of provision, attainable only through a more uniform educational structure that avoided the pitfalls of early selection. The majority of Labour politicians clearly favored a system which retained the grammar school as an exclusive institution

but facilitated working class entry. Many of the early Labour leaders who had been denied educational advantages saw their own success as a model of mobility. They objected not to class distinctions, but rather to those obstacles to advancement which fortitude and fair competition could not overcome. If Labour generally supported legislation that extended opportunity, many of its spokesmen judged educational questions in terms of immediate benefit for the wage earner. Thus during the debates over the Fisher Act of 1918, trade unionists opposed provisions for continuing education that might deprive families of the wages of adolescents. Conversely, during the 1920s Labour ministers proposed the raising of the school-leaving age as a means of reducing unemployment.

Barker interprets this indifference to the broader educational issues as reflecting a lack of Socialist principle, presumably on the grounds that Socialists genuinely committed to social change would have adopted a radical educational policy. Instead of reconstruction, Labour settled for fair shares and tended to emulate the pragmatism of the older parties. None of this is very new to students of British politics, but the author seems to regard his analysis as strongly revisionist. In his view other historians have egregiously exaggerated the Socialist ingredient, ignoring the fact that Labour was firmly in the "tradition represented by liberal collectivism and social radicalism" (p. 11). Barker announces, as though it were a startling discovery, that Clause IV of the party constitution avoids the term Socialism, and he proposes "Labourism" as an appropriate designation for party ideology. But surely it would be more sensible to accept the Socialist self-description at face value and to assess its significance, than to reject it for lacking specificity and for failing to measure up to some objective criterion. What is distinctive about British Socialism—its strength and its weakness—is its very eclecticism, its strong roots in a democratic, liberal tradition, its disregard for the finer points of the class struggle. If Labour was indifferent to educational matters, it was because Socialist politicians, probably unwisely, regarded them as less important than common ownership and full employment.

As a survey of educational policy, the work is competent, but the larger questions are all too often lost in a morass of conference resolutions and committee reports. The focus tends to be on politics at the center, to the neglect of any intellectual dialogue carried on in pamphlets and periodicals. Even the writings of R. H. Tawney, cited as the architect of Labour

views, receive only cursory examination. Adult education is briefly sketched, but no attempt is made to explore the content of W.E.A. classes or weekend schools. Nor is there any effort to explain the shift in Labour's attitude after 1951 in favor of the comprehensive school and toward greater concern "with the shape of society, and even with the quality of life" (p. 97). Although the author offers a useful elucidation of Labour's views on education, his contribution to a deeper understanding of the party is slight.

Boston University

Unions, Parties and Political Development: A Study of Mineworkers in Zambia. By Robert H. Bates. (New Haven and London: Yale University Press, 1971. Pp. xi, 201. \$12.50.)

Demonstrating the crucial importance of copper for Zambian well-being—in 1966, copper represented 95.3 per cent of the £236 million in Zambian exports—Professor Bates calls our attention to an important problem facing the Zambian government, as well as other governments confronting the dilemmas of rising demands on scarce resources. The problem is how to transform an organization designed for making demands—in the Zambian case this is the African Mine Workers Union—into an instrument of government for the limiting of demands and for the increasing of production.

Despite vast increases in capital investment since Zambian independence, average productivity has decreased by 12 per cent, while wages have gone up, and industrial discipline has faltered. Bates shows that in its attempts to rectify the situation by exerting political control over the organization of the AMWU, the government has largely failed.

Though the government has been successful in convincing the national leadership of the AMWU, it has failed to convince the local branch leaders, who time and again have rejected government orders to curtail wage demands and to promote industrial peace. In some of the strongest chapters of the book, Bates shows convincingly that branch leaders cannot follow government directives because their position rests not on the good will of the government, but on the militancy with which they are able to articulate their workers demands to the expatriate managers. In the few cases where the United National Independence Party (UNIP), the ruling party, has tried to substitute its own men for labor leaders, it has been rebuffed by the rank and file. For the rank and file does not seem to want to take a "na-

tional" view of Zambian development. The workers are jealous of their rights and prerogatives, and their reference groups are not the poor peasants in the villages, but seem to be the expatriate managers and supervisory staff whose wages have grown from precolonial levels. This places UNIP in a difficult bind: Should it side with the workers against the foreign companies it would hurt the Zambian development program; should it side with the companies against the workers it would look as if it defended expatriates against Africans. It would seem that one solution might be nationalization. But even after August 1969, when nationalization of the copper industry took place, the rank and file refused to sanction government imposed union leadership.

Bates's book deals in an original way with a significant issue of political and economic development too long neglected by the literature on the "third world." It is rich with insights and detail, and it is written with great clarity. It may be suggested however, that by viewing the conflict between government and the union in organizational terms only, Bates may be neglecting two other problems of interest to political scientists, the first pertains to the survival of industrial democracy in Zambia, and the second to the problem of class formation in Africa. Turning to the first, the question may be posed: how is it possible that the principle of industrial democracy—the free and fair elections of branch union officials—has not been subverted in Zambia when it has been politically abrogated in so many other of the third world countries? Is the ruling elite so committed to democratic procedure that it refuses to exert force on the AMWU? Or contrarywise is it that the AMWU has the power to insist on democratic procedure? If it does, where does this power stem from? Bates does not tell us.

Nor does he address himself to the issue of class formation. Though he brings out with some force the structurally induced conflict between African workers and expatriate managers, by referring to the political class as "government," Bates overlooks the possibility that the rank and file does not accept government directives because it finds illegitimate the economic and status positions of the governing elite.

We have evidence from other parts of Africa such as the Nigerian General Strike of 1964, and the Sekondi-Takoradi strike in Ghana under Nkrumah, that African workers are responding not only to the immediate context of industrial relations, but to the broader context of class formation. In postcolonial African so-

cieties class formation is proceeding from the top down, from the pinnacles of the political class made up of successful politicians and senior civil servants down to the unmobilized peasantry. Somewhere in the middle, nearer the political class than to the peasantry lies the industrial working class. But it is a class which has not as yet learned to accept its position below that of the political class. Why should an industrial worker with ten years on the job make less than a young parliamentary secretary straight out of university? The answer is obvious only in societies where criteria for class formation such as educational level have become widely legitimate. In African societies, the legitimacy of class differences is still very much in question, and as long as such questions persist, there will be conflict between industrial workers and governing elites.

ROBERT MELSON

Purdue University

The Nyoro State. By John Beattie. (Oxford: Oxford University Press, 1971. Pp. 280. \$9.75.)

The great merit of this work is that it makes Beattie's important studies of this major Ugandan kingdom easily available to specialist and newcomer alike. Basically it is an expansion of the first half of Beattie's earlier student text, *Bunyoro, an African Kingdom* (Holt, Rinehart & Winston, 1960), and as is to be expected from its author, it is a humane book, written in clear, uncongested English, with a minimum of the foreign language terms with which anthropologists sometimes protect the sacred inviolability of their message. Three main sections deal with myth and history, with the traditional kingship, and with changing political relationships and roles in the colonial period. The book ends with an essay comparing the traditional Nyoro kingdom with its more highly centralized neighbor and rival, Buganda. In taking up these topics, the book provides a useful synthesis of its author's earlier writings on the kingship, chiefs, chiefship, land tenure, and "democratization." New material and analysis bring the history of Bunyoro, in general terms, up to the abolition of the kingdom in 1967 and treat more freely and fully than before the major internal political dispute at the time of Beattie's fieldwork in the early 1950s—the attempt to wrest from the king the control of appointment to chiefships which he had obtained under the 1933 Bunyoro Agreement.

Much is therefore provided by this book, but the reader, particularly the reader to whom a good deal of the material is already familiar, repeatedly finds himself in the ungrateful posi-

tion of asking for more. This is partly because Beattie's reputation runs before him. He has always been concerned with the political in general and with the effects of European overrule on indigenous politics in particular, and he has contributed most valuably to the understanding of African kingdoms under colonial overrule and in precolonial days. His work on the limits of despotism in traditional African settings and on the paradoxical results of Indirect Rule policies, leading in the Nyoro case to a more than traditional measure of autocracy, are important instances of this concern, raising expectations of a major new work. High expectations are also aroused by developments in the disciplines concerned since the 1950s, the growth of African history as a specialized field of research, the eruption of political scientists into Africa, and particularly the movement of political anthropology from its early preoccupation with administration and its functional alternatives to its current awareness of competitive processes as a major theme.

And finally, Beattie's text itself constantly raises expectations by stimulating the reader's imagination and suggesting questions beyond the kinds of analysis and explanation actually offered. The reader is told, for instance, of the myths and traditional histories of Bunyoro and their congruence with social and political values. He is reminded that such stories have no necessary, unchanging form so long as a written version has not become the sole authority: names and generations in the royal genealogies, for example, have multiplied prodigiously since they began to be written down. He is likely therefore to ask how these stories and their possibly varying forms actually related to the political process: Who knew them, and who told them? In what contexts were they told? What was their importance to their hearers? Were there rival versions? And so on. The reader has also been reminded that new media for the dissemination of such material were already becoming available: some of the earliest publications in the indigenous language were of this kind. He is therefore certainly likely to be interested in the changing situation and its relevance to the political importance of the old stories, and possibly to the creation of new ones.

In a rather similar way, the chapter on "The Modern Kingship," to take a further example, offers tantalizing glimpses of the king, his chiefs, and his people in action. A senior chief spears the king's special bull as it roams the capital one night, and he is dismissed from his post and prosecuted for it. Through the recounting of such incidents the reader is left in

no doubt that there was a bitter contest between the king and his opponents, but this does not lead on, as he hopes it will, to a systematic analysis of the parties and the interests involved in the dispute, of the resources they could bring to bear and the strategies they pursued. It is clear in this context, incidentally, that Protectorate Government officials were very much a part of the relevant political field, and it is a pity that the book's "Nyoro State" frame of reference tends to leave them as peripheral "voices off stage." Again, in the crucial area of appointment to chiefships, Beattie provides fascinating material on the kinds of people who became chiefs, the procedures prescribed, and the way in which, according to rumor, things actually occurred. The reader's appetite is whetted for a final direct discussion of how some individuals succeeded in obtaining preferment, how others failed, and how preferment was related to the larger political process. The discussion does not come and he is disappointed.

The book conveys strongly a sense of what it was like in Bunyoro in the 1950s, and through its basic categories of traditional and modern, it places its observations within a general framework of change. The ungrateful reader may ask for more but he has been given much already. It is valuable to have Beattie's political material concerted into a single volume; and it is a volume which will provide as useful an introduction to the more detailed study of African kingdoms as his earlier volumes have provided for other and more general fields of anthropology.

S. R. CHARSLEY

Glasgow University

Origins of the Chinese Revolution, 1915-1949.

By Lucien Bianco, translated from the French by Muriel Bell. (Stanford: Stanford University Press, 1971. Pp. xiii, 223. \$8.50.)

Dozens of fine monographs on modern China have appeared during the past two decades, and all provide important insights into various aspects of Chinese history and institutions. And now Professor Bianco, with an unerring eye for the essential and germane, has tied all these strands together and has produced the best introduction to Chinese Communism ever published. (This is one case in which the blurb is absolutely true.) I know of no other work on modern China that can match its cogency of analysis or its lucidity and succinctness of presentation. Bianco's work is much more than another display of the Gallic talent for grand synthesis. His expertise on the peasant problem showed him where to look for the real motive

force in the rise of Chinese Communism.

Why did the Communists succeed in winning the support of the peasants? Bianco agrees that the Japanese invasion of 1937 gave Mao the opportunity to exploit the rising tide of nationalist sentiments. He then goes on to show that nationalism was not the only ingredient in the Maoist formula for revolution. Nationalism was in fact the common platform of all Chinese politicians and leaders in the 20th Century, but as Bianco points out, "It was through Communism that nationalism triumphed" (p. 166). The difference between the Communist and other brands of nationalism was that "in addition to being authentic patriots they [the Communists] were genuine revolutionaries, men who understood the needs of the people, knew what changes had to be made, and set about making them" (p. 159). By providing the peasants with better government, by allowing them to participate in the governing process, and by affording them greater social justice, the Communists won mass support during the Second World War. That support not only enabled them to resist the Japanese, but it gave them power to win the postwar civil conflict. When the war broke out in 1937 there were 80,000 men in the Red Army. In 1945 there were 900,000, plus a militia force of 2.2 million men. Yet as Bianco reminds us, this was not the whole story. "It was during the Second World War that the Kuomintang *lost* the civil war" (p. 159). Kuomintang leadership was incapable of ameliorating rural distress during peacetime. The war aggravated this social misery and created even greater challenges which further exposed the government's inadequacy.

In explaining the Communist success Bianco focuses on the essentials. A turbulent peasantry and a pervasive nationalism—fired by a significant measure of xenophobia—added up to a revolutionary situation that could not be relieved through gradualist methods. (Here the author is particularly instructive in showing the inefficacy of well-intentioned rural reformers who attacked the symptoms rather than the causes of peasant poverty. He tells us of idealistic students who tried to promote hygiene by distributing pamphlets on the use of toothbrushes to the peasants when these people did not have the price of one toothbrush for an entire family.) The Communists created a disciplined party and effective army using this social and emotional force. Bianco furthermore makes it quite clear that it was not just that the Communist leadership was more efficient or capable in exploiting this objective situation, though as a good historian he notes that the

presence or absence of effective leadership is in itself an important historical datum. The entire history of China since the Opium War of the last century shows that China could not stand up to the West until it fully mobilized its resources, both human and material, and that such a mobilization was impossible as long as the socioeconomic structure was dominated by the gentry-landlord stratum. The social revolution was therefore an indispensable condition for realization of nationalist goals. The Kuomintang, however, became even more conservative as the war progressed. "Installed in the back country and cut off from the merchant bourgeoisie of the eastern ports and great cities, its social base consisted almost exclusively of that most conservative of classes, the large landowners" (p. 160). Real agrarian reform would have threatened to destroy the social base upon which the Kuomintang was built.

As Americans digest the implications of Bianco's account for United States policies toward Asia, they should be reminded that many of his important conclusions were being reported to Washington by official American observers more than 25 years ago, when the Communists were first emerging from obscurity. In September-October, 1944, for example, John S. Service, after several months of close observation of the Communists, reported that "The peasants support, join and fight with the Communist Armies because they have been convinced that the Communists are fighting for their interests, and because the Communists have created this conviction by producing tangible benefits for the peasants. . . . The common people, for the first time, have been given something to fight for" (see Service's *Amerasia Papers: Some Problems in the History of U.S.-China Relations*, Berkeley: Center for Chinese Studies, 1971, pp. 152, 161). As for the Kuomintang war effort, the most devastating criticisms can be found in General Wedemeyer's reports of 1944-45, reproduced in the official U.S. Army history (see *Time Runs Out in CBI*, by Charles F. Romanus and Riley Sunderland, Washington, D.C.: Office of the Chief of Military History, U.S. Army, 1959). If Washington subsequently failed to understand the reasons for the victory of Communism in China, it was not due to lack of information.

In proving once and for all that Chinese Communism is an indigenous phenomenon with deep roots in Chinese society and history, Bianco also brings Mao Tse-tung's role into proper perspective. He sees Mao as a "mediocre theoretician" whose "strategy seems to rep-

resent the triumph of common sense" (pp. 79–80). But in questioning the myth of Mao's infallibility and profundity as a thinker, Bianco makes Mao's greatness seem much more credible. More than any other modern Chinese leader Mao was aware of peasant bitterness, and no one worked more persistently to turn this bitterness into a political and military force. Bianco sees Mao's greatness in terms of his heroism, toughness, audacity, and the "courage to free himself from dogma" (p. 80). The author nevertheless reminds us that given the backwardness of a country like China, the real test of this heroic leadership begins only after power is won.

Bianco's perceptive and well-balanced study must be read by everyone who wants to understand what the Chinese revolution was all about.

HAROLD Z. SCHIFFRIN

The Hebrew University, Jerusalem, Israel

Constitutions of the Countries of the World.

Compiled and annotated by Albert P. Blaustein and Gisbert Flanz. (Dobbs Ferry, New York: Oceana Publications, 1971–. Twelve volumes, loose-leaf, \$69.00 each.)

In addition to the first volume of this compilation, supplied by the publisher for review purposes, I have been able to examine three of the five further volumes which were issued in 1972. All four conform to a basic design which is to provide, for each country, (1) a chronology of constitutional development, (2) the text of the current constitution in English, and (3) an annotated bibliography of selected primary and secondary materials relating to the country's constitutional life.

The over-all plan calls for approximately 10,000 (!) loose-leaf pages of text, to be brought up to date by annual supplements. The editors commit themselves, in an introductory statement (which is of bibliographical interest itself as a review and assessment of previous efforts along the same lines), to currentness of the collection as their first priority. If they succeed in this, they will have created a uniquely valuable research resource. This will be especially true if the updating includes not only constitutional documents but also the chronologies and bibliographies.

Examination of the first four volumes indicates that the chronologies are almost uniformly excellent and the bibliographies soundly representative. (I missed under "Uruguay" references to the work of Ernst-J. Kerbusch, and I suppose that others will spot comparable omissions, but generally the scope of the included

literature is international and current.)

The only comparable collection in the English language is Amos Peaslee's *Constitutions of Nations*, now in the third edition. It, however, lacks the flexibility of the loose-leaf format, its chronological summaries are much briefer and often not current, and the bibliographical material of the latest edition is quite limited. "Blaustein and Flanz" will undoubtedly replace Peaslee as the prime reference work for information on the constitutions of the nations.

FRANCIS H. HELLER

University of Kansas

The West German Legislative Process: A Case Study of Two Transportation Bills. By Gerard Braunthal. (Ithaca: Cornell University Press, 1972. Pp. xviii, 290. \$11.50.)

In tracing the stormy course of two transportation bills in the mid-1950s, Professor Braunthal usefully contributes to what, one hopes, will be an increasing number of empirical studies of the West German legislative system at work. The author, privileged to receive access to confidential ministry files, provides a revealing glimpse of the executive role in legislation and of interest-group interaction with the administration in the Federal Republic. This perspective lends depth to his discussion of the more public phases of the legislative process in the West German parliament. Students of German politics and of comparative politics will welcome this brief but searching study.

Underlying the Transportation Finance Act of 1955 and the ill-starred Highway Relief Bill was the growing competition which the burgeoning trucking industry gave to the railroad system of West Germany. By 1952–1953, the Bundesbahn faced a financial crisis, and the road network showed signs of strain. The two transportation measures powerfully affected major productive enterprises of the country, and evoked strong responses from a considerable variety of interest groups. The ensuing controversy divided the coalition cabinet, notably the Ministries of Transportation, Finance, and Economic Affairs, and cut across party lines. It sparked a CDU/CSU rebellion on the floor of the Bundestag. The Highway Relief Bill was permitted to die in committee. The tax provisions of the Transportation Finance Act then became the main stakes in the battle of the interests. In its final form, the Act fell considerably short of providing a blueprint for future transportation development. Braunthal's step-by-step account of the two bills is located in the context of both earlier and later transportation policy in Germany.

Regrettably, Braunthal chooses not to consider in any more than a handful of cursory footnotes Gerhard Loewenberg's masterful volume, *Parliament in the German Political System* (1967). He does not comment on Loewenberg's scheme of case selection, which prefaces, and is exemplified in, more than one hundred pages on lawmaking in West Germany: "The examples chosen have been selected, not so much as representative, but as limiting cases of the kinds of treatment which legislation receives in the Bundestag. They indicate the perimeter within which most cases occur" (Loewenberg, p. 282). By contrast, Braunthal does not make clear the grounds for choosing the two transportation bills to illuminate the West German legislative process.

Braunthal professes an interest in testing some general hypotheses:

The more political actors involved in the decision-making process, the more difficult it becomes to measure their power and responsibility in any one decision; the more opposition develops to a bill, the more concessions the executive makes to the political actors of the other subsystems (political parties, legislature, and so forth) to assure its passage, and vice versa; and the greater the adverse economic impact of a bill on interest groups, the greater and more successful their resistance (p. xi).

Nowhere, however, does he provide operational definitions of the key terms of these hypotheses or place conditions on the evidence he will accept. Nor does he indicate how it is possible for the two transportation bills alone to serve as a test for the hypotheses.

Apart from these conceptual difficulties, the book is a useful supplement to constitutional descriptions of the West German legislative process. In what it says of the functioning of the ministries, the cabinet, and major interest groups in the controversy over the two transportation bills, the book casts light on aspects of the legislative process not normally open to public scrutiny.

ARTHUR BRUCE BOENAU

Gettysburg College

Police State. By Brian Chapman. (New York: Praeger Publishers, 1970. Pp. 150. \$5.00.)

Since Hitler's Germany, the term "police state" has come into everyday usage. It has assumed a negative connotation, projecting visions of arbitrary and draconian police actions, executed with total disregard for human rights, freedom, and dignity. Consequently, the term is often used (or misused) by those opposed to police generally as they attempt to sway public feeling. The author posits an important ques-

tion: "Why is it that the idea of police rule is so much more offensive than the idea of, say, military government?" (p. 94).

Although primarily descriptive of European police states, Brian Chapman's book impressively clarifies the term and puts the concept of a unitary police organization into proper perspective. It does so by tracing the history of the term "police state" from its origins to its entry into the English language and presents collateral information in a logical, orderly fashion. Chapman identifies and analyzes three different classes of police states: (1) traditional; (2) modern; and (3) totalitarian.

Although the descriptive chapters are not as fast-moving as his later material, they are necessary for a thorough understanding of the comparative forms of centralized police. Each class is examined in detail, using a comparative approach that allows easier identification of the similarities and differences among classes.

Of special interest to American readers is Chapman's analysis of certain European police methods. He argues that spying, brutality, and the arbitrary use of power are certainly concomitants of any police system, but that their incidence cannot be taken as *prima facie* evidence of a police state. In fact, these methods result naturally when any police agency is regarded with indifference by an apathetic public.

Brian Chapman sees alienation from the public as a breeding ground for overt abuses and usurpation of police powers. Taking his argument a step further, the author reasons that it is the social reformers, through their insistence upon immediate social change, who actually catalyze the emergence of a police state. So the police state stems from the regime's virtually unbridled authority to use coercion to maintain order, i.e., the status quo. This virtually forces the police, as agents of the state, to resist change and engage in periodic violence.

Chapman's analysis of Germany's political evolution from a modern to a totalitarian police state under Hitler's rule should prove enlightening to students of public and comparative administration. In this context he examines and explains the administrative intricacies involved in the development of a police state noting that police apparatus must become superior to political administrative officers, the judiciary, and the military before a true police state can exist.

Although the book deals with the concept of the police state as a political phenomenon, Chapman's chapter on police psychology is highly relevant to practitioners and academicians interested in the administration of criminal justice. In this chapter, the author cuts to

the very heart of police work and examines the "whys" of such police issues as role, violence, corruption, loyalty and morality. While based on European experience, Chapman's observations apply to the contemporary American scene. Moreover, the analogy of the police profession to a combination of soldier, priest, and artist is especially provocative, though not new. (See: August Vollmer, *The Police and Modern Society*. Berkeley: University of California, Bureau of Public Administration, 1936, p. 22.)

In summary, *Police State* is short, readable, timely, well documented (74 citations), and based on substantial research (56 authors are listed in the bibliography). It should be useful to students of political science, particularly those whose interest is comparative government. The book will have little value to American police practitioners, however, for it deals only with European police states. Brian Chapman has achieved his goal of enabling students and others to understand and apply a key concept in political science.

SAMUEL G. CHAPMAN

University of Oklahoma

The Indian Army; Its Contribution to the Development of a Nation. By Stephen P. Cohen. (Berkeley and Los Angeles: University of California Press, 1971. Pp. 200. \$7.50.)

No aspect of contemporary India's national political life has been as ignored by scholars as its military system. This is in part due to the fact that Nehru's grand designs in foreign policy minimized the visibility of Indian military power. When that veil was torn in the Sino-Indian border war of 1962, most analysts began concerning themselves with new Indian strategies and ephemeral matters like nuclear options. Stephen Cohen chose instead to pursue a much more mundane but possibly more promising traditional approach to the history and structure of the military machine in the subcontinent. He managed to overcome some of New Delhi's historic and notorious sensitivity to such research, but at the price of analytical depth and descriptive candor.

The book is essentially a brief and clear historical primer on the Indian army with only one of the seven chapters on postindependence developments. (The book's subtitle should be read as a publisher's afterthought, not an author's intent.) The major questions examined by the author all concern the political control of the armed forces; civil-military relations, the nature and ethos of the officer corps, the re-

cruitment and socialization of troops and the adaptation of military management to the three great crises of the twentieth century—World Wars I and II and partition/independence.

The most interesting section of the book explores the "Punjabization" of the army, a process that involved long-term strategic choices on recruitment, regimental organization, ethno-communal balances in the forces and the relationships between officers holding different commissions. The chosen option left India and Pakistan with armies from a small and territorially discrete region of the subcontinent, with a great imbalance in communal representation (Sikhs and Muslims were greatly over-represented; high caste Hindus practically absent), and with regiments organized on ethnic and regionally distinct loyalties. This system failed to provide an adequately broad recruitment base in the World Wars, but it was an optimum approach to civil control by the imperial power.

The structure of the army system perhaps explains why Indian nationalism did not have a greater effect within the military forces. The chapter that deals with this matter focuses on the Indian National Army—a force of prisoners of war organized by the Japanese to aid them in the conquest of South Asia. Dr. Cohen believes that the political loyalty of Indian officers to the British was much more tenuous than has been generally thought, and that its political management must therefore have been a more important matter for imperial policy than is generally supposed. The INA trials after the war symbolized the dilemmas of officers caught between the values of organizational loyalty, behavior fitting and proper as a prisoner of war, and loyalty to the Indian national cause. The author sets forth the problem, but only hints at the way in which these questions were resolved, noting that "when full documentation is available it may well be seen that Nehru and Auchinleck played key roles in the relevant decisions" (p. 163).

The last chapter of the book deals all too briefly with the postindependence army and its management. There are no statistics on the numbers of officers, the sources of their commissions, the caste and locality of their recruitment, their training curriculum and specialization options, inter-service relationships or the changing social context of the profession of arms in India. Surely these factors shape self-image as much as an awareness of history. At the purely descriptive level, it would have been valuable to have the author's expert opinion on the Thimayya-Krishna Menon affair

and on the charges and countercharges of military mismanagement in the Sino-Indian war. These comments are perhaps prime examples of the reviewer's sins—noting the book that wasn't written—but one is tantalized by what Professor Cohen appears to know but doesn't say.

In his next book, perhaps the author will address himself to many of these questions, and perhaps explain such statements as "Modernization will come to South Asia, but only at a pace tolerated by the military" (p. 2). Does the Indian cabinet *have* to consider army predilections on basic development choices? Is defense industry now an imperative dictated by the forces? Has the expansion of the military budget brought an equivalent rise in the voice of the army in national politics and in foreign policy?

There is something of the modesty of a dissertation in the book, and the scholar's painstaking appreciation of historical chance is also evident. Given the paucity and the sensitivity of information on the Indian Army, Dr. Cohen has done a service to all scholars in gathering and assessing basic structural and historical evidence. His knowledge, commitment, access, and experience will doubtless lead to a more empirical and contemporary study of Indian military organization, itself rapidly changing, in the future. Political scientists can look forward to his next book, to which this one will stand as the historical preface.

WAYNE WILCOX

Columbia University

Rulers of Empire: The French Colonial Service in Africa. By William B. Cohen. (Hoover Institution Press, 1971. Pp. 279. \$9.50.)

As colonialism is being superseded by neocolonialism—and as imperial archives are gradually made available to scholars—the colonial period of Africa has been attracting an increasing amount of attention on the part of historically-minded social scientists. Some of the resulting work (like Ralph Austen's "Northwestern Tanzania under German and British Rule" or J. Gus Libenow's work on the Makonde) is mainly concerned with the impact of alien rule on indigenous African cultures; others, following Robert Heussler's study of "Yesterday's Rulers" (1963) have concentrated on the men and doctrines that made colonial policy what it was—sometimes, as in the case of Gann and Duignan, with perceptible sympathy and even nostalgia.

William B. Cohen's remarkable study of the

French colonial service in Africa (*West Africa*, really) falls in the latter category. With a felicitous combination of scholarship and writing skill, he details for us the growth of a tradition of overseas service in what may well be the most homebound nation on earth. Tocqueville suggested that French colonial administration was a caricature of the metropolitan bureaucracy. The British colonial service, one might add, could be viewed, by contrast, as a caricature of English squirearchy. But the problems faced by any overseas bureaucracy were so unique as to make all such parallels rather pointless. The French colonial service numbered some 4,000 functionaries during the seventy-three years of its existence. A body of such size, insulated from day-to-day supervision and made up of members who had, for the most part, selected overseas service as a means of escaping the confining norms of French society, was bound to develop its own traditions of independence and esprit de corps, like some sort of white-collar Foreign Legion. What is surprising, in fact, is that it did so to such a limited extent.

Cohen rightly points out that the paper centralization of the French colonial administration was largely formal. Physical distance from Paris (or even from Dakar and Brazzaville, the regional administrative headquarters of AOF and AEF), the instability of French cabinets, and the resulting incompetence of the successive incumbents at the Rue Oudinot combined to leave the Commandants de Cercle in unchallenged control of their districts as the true *Rois de la brousse*. Nor did "Colo"—the famed *École Coloniale*—instill in French colonial service the rigid, uniform, centralized sense of values which the other *grandes écoles* of Jacobin extraction provided for almost every aspect of French public life.

In what probably represents the most original portion of his book, Cohen outlines the slow development of the *École Coloniale*, and its persistent struggle to achieve an excellence and prestige that could match those of *Saint-Cyr*, *Polytechnique*, *Normale Supérieure* and other such breeding grounds of the French meritocracy. It was not until the 1930s, however, that the graduates of the *École Coloniale* were able to fill a majority of the appointments to the corps of colonial administrators. Slight wonder, therefore, that "in their methods of administration, the colonial functionaries seem to have been relatively unaffected by the *École Coloniale*" (p. 121). What the author may have overlooked, however, is the extent to

which French colonial administrators, whether or not they realized it, mirrored in their official behavior the norms of French political culture and thus tended to reproduce metropolitan routines rather than to improvise new methods, as their de facto autonomy might easily have permitted.

Bureaucracies are seldom at their best in an era of rapid political change. The French colonial service was no exception; and whatever sense of its purpose and "mission" it might have developed during the age of "classic" colonialism was largely diluted after World War II by considerations which it was not prepared to entertain. With his subject matter thus gradually fading away, Cohen falls back, during the last third of his book, on a description of French decolonization policy (or the lack of it). He does so competently—and, on occasion, brilliantly—but it is understandably not the most original portion of his work. It is at this point, however, that the reader is likely to become aware of a strange void, namely the almost complete absence of the Africans from the pages of Cohen's book. Houphouët-Boigny appears only once; Sekou Touré not at all. The dismantling of the chieftaincy system in Guinea—Touré's political masterstroke—is presented only through the rather anticlimactic comments of the French administrators whom he convened to legitimize his brilliant coup and who, whether or not they realized it, were being thoroughly manipulated by the Guinean leader. Methodologically, of course, there is nothing wrong with Cohen's treatment of his chosen subject: he is, after all, dealing with the colonizers and not with the colonized, but the absence of the colonized deprives his study of a dimension of reality which could have made it better rounded, if not more scholarly. Similarly, the author's laudable desire to maintain a value-free attitude toward his subject leads him to avoid dealing with the human quality of colonial rule. All French administrators, we are led to believe, were basically honorable men. Their professional shortcomings (documented by a skillful use of personnel files) are amply substantiated, but owing to the nature of the author's source material, these are appraised in purely bureaucratic terms. A good number of French administrators are reported to have been poorly trained, bungling, incompetent, and occasionally dishonest, but we learn little or nothing of what it may have been like for an African to live under their authority. Such is the price of objectivity. Despite such limitations, however, Cohen's book will be useful to anyone interested in the history and politics of

colonialism, as well as to those who seek to understand the distinctive political culture of French-speaking Africa.

EDOUARD BUSTIN

Boston University

Les Républicains Indépendants: Valérie Giscard d'Estaing. By Jean Claude Colliard. (Paris: Presses Universitaires de France, 1971. Pp. 352. 25F.)

French political parties as institutions have evoked a burst of scholarly interest among French students of politics in the last several years. Since 1966, serious sociological studies by Frenchmen have been published in book form on the S.F.I.O. (by André Philip), the P.S.U. (by Guy Nania and by Michel Rocard), the P.C.F. (by Annie Kriegel and by Frédéric Bon et al.) and the U.N.R. (by Jean Charlot). The Democratic Center and the Radical-Socialists are the only national parties that have escaped such scholarly scrutiny, though the studies have varied greatly in thoroughness. This useful volume by M. Colliard falls squarely in this stream of work.

In large part, Colliard follows Charlot's *L'U.N.R.: Etude du pouvoir au sein d'un parti politique*, both in compass and in structure. Their books are the most extensive, thorough, and scholarly of the lot. Both consist of a long first section (204 pp. for Colliard, 111 pp. for Charlot) presenting the development of the party chronologically, followed by another long section (129 pp. for Colliard, 190 pp. for Charlot) of topical analysis. Finally, each has a short documentary appendix (7 pp. and 37 pp.).

Colliard's greater attention to chronology results largely from the longer time span he covers (1958–70 compared to 1958–62). He labels his chronological section "*Les déchirements d'une révision*" and develops the theme that the movement was constantly torn between the past attachments of its leaders and members to traditional conservatism and their current conviction that the welfare of France (and of their electoral prospects?) required de Gaulle's leadership and, after his resignation, Gaullist unity. The author documents his thesis thoroughly and persuasively. The incohesiveness of the movement emerges clearly, and the crisis points and issues are quite visible, although their factional basis remains confused. We see Raymond Marcellin at the tip of the "*oui*" end of the spectrum and Giscard d'Estaing similarly extreme on the "*mais*" end, but the distribution in between is not clarified. Whether this confusion results from the situation in the party or

from the author's method of presentation is unclear also.

The second half of the book is divided into two parts. The first analyzes the parliamentary elections of 1962, 1967, and 1968 and the caucuses of the *Républicains Indépendants* in the National Assembly and the *Union Parlementaire Républicaine et Rurale* in the Senate. The latter part looks at the extraparliamentary structure of the party, its doctrine and program, its influence, and its image.

His treatment of elections and caucuses is quite conventional. He performs the usual analysis of both voters and M.P.s by geographic, occupational, and demographic characteristics. He also studies the parliamentary activities of the caucuses. The section on the extraparliamentary aspects of the party is the shortest (31 pp.), quite in keeping with the party's character as primarily parliamentary. Under structure, he covers the *Fédération nationale des Républicains Indépendants*, and the finances and press of the party. The most striking impression to emerge from this section is the dominance of Giscard d'Estaing in this area of party activity. Under doctrine, he considers four main points: centrism, liberalism, European integration, and Gaullism. Unfortunately, this part of the study is especially skimpy (6 pp.). Surely, a comprehensive survey of R.I. speeches in parliament and election campaigns, party resolutions, and party publications could have yielded a more substantial review of its positions.

On the whole, M. Colliard has produced a very useful study on a political party that is especially difficult to understand. The *Républicains Indépendants* are peculiarly beset by ambiguity. They are Fourth Republic parliamentarians dedicated to Fifth Republic presidentialism; local "notables" *par excellence* riding the coattails of passionately anti-notable Gaullism; organized nationally by Giscard d'Estaing, yet fiercely independent of him in their constituencies; terrified of separation from orthodox Gaullism, yet equally wary of absorption by it. M. Colliard's book provides all the information and explanation necessary for an understanding of the movement, although his style lacks the punch to make that understanding vivid.

More seriously, he has passed up a number of opportunities to flesh out spots that are especially weak. For instance, he mentions no attempt to conduct special surveys for information on and opinions of R.I. voters, yet because of the small number of R.I. voters who appear in general voter surveys, their indications are notoriously unreliable. Even less understand-

able is his failure to survey R.I. M.P.s for his profile of them. Unlike the Charlot study, we find no long list of party leaders whom the author has interviewed. In short, the study is a valuable addition to our literature on French political parties, filling a major gap, but it lacks the stylistic sparkle and the imagination to make it a truly outstanding contribution.

WILLIAM G. ANDREWS

SUNY at Brockport

Egypt Under Nasir: A Study in Political Dynamics. By R. Hrair Dekmejian. (Albany: State University of New York Press, 1971. Pp. 368. \$10.00.)

The significance of this book lies in its attempt to present Egyptian politics in a systematic framework, using as its analytical key the idea of charismatic leadership and its routinization. Having acquired his magical reputation through his diplomatic successes from 1954 to 1958, Nasser (or Nasir) sought to use it as a springboard for initiating changes in the outlook of Egyptians and the organization of their affairs, preaching the gospel of radical "Arab socialism," redistributing wealth, and launching ambitious development programs. Routinization was to come through the improvement of administration under a technically qualified elite, and through the newly introduced democratic institutions of parliament and the single mass party, the Arab Socialist Union. The author very competently describes these efforts in detail—ideological elaboration, reform measures, and institutional change—and explains why at best the routinization was only marginally successful. In an extensive and interesting discussion of the impact of the 1967 defeat on domestic Egyptian politics he shows how Nasser sought to deepen the impact of the revolution and particularly to breathe new life into the listless Arab Socialist Union.

The theme of charisma is certainly a useful and valid one in Nasser's case, and readers will appreciate Professor Dekmejian's systematic, authoritative, painstakingly documented, and level-headed analysis. Clearly he knows a good deal about his subject, and has thought his points through. He provides more comprehensive information on certain matters than is available elsewhere: the evolution of Nasser's ideology, for instance, and data on the social and career background of the 131 individuals who held cabinet office from September 1952 through 1968. Moreover, he writes intelligently and intelligibly. Overall, the book is well worth the attention of political scientists who want to read one work on the Nasser regime.

I do feel, however, that the concepts and tools of contemporary American political science not only have their limitations in enabling us to learn about such subjects as this, but may in some respects actually inhibit understanding. While Professor Dekmejian's work clearly commands respect, I am not so sure that he has managed to shine as much light on Nasser and Egypt as some others writing from a journalistic or diplomatic background, such as Lacouture, Stephens, Copeland, and Nutting, or others proceeding from an avowed Marxist framework, e.g., Anouar Abdel-Malek and Mahmoud Hussein.

The charisma-routinization formula, for instance, seems to have encouraged Professor Dekmejian to give inordinate attention to Nasser's ideological preachments, and to give the impression that the doctrines he enunciated, superficial as they often were, substantially reflected a determination on his part to translate his prestige into national improvements. The question here is not merely whether Nasser really thought the way he talked (Professor Dekmejian expresses healthy skepticism on this score), but whether his words were even intended to induce thought amongst his listeners. And is there any more reason to assume that Nasser sought to parlay his charisma into social change than that he sought to parlay his championing of social change into greater charisma?

Again, the significance of survey data about the elite can easily be exaggerated: the more we learn about the numbers of civilians with Ph.D.'s in high office in proportion to army officers, the more we may forget to ask what the role of each of them was in relation to the man at the top—who reputedly manipulated them all, but some with the help of others. The conspiratorial atmosphere that never disappeared from the regime and that surely stemmed not only from its origins in the 1952 coup d'état but equally from Nasser's own highly suspicious mentality, is not easily reflected by survey data nor by a systemic mode of analysis. It is mentioned (p. 191) that eight of the 131 in the elite survey had once served in military intelligence, but this statistic does not begin to indicate the importance of their role. Elsewhere (pp. 261–2, 268, 306–7) the author refers to the oppressive ways of the security police and to Nasser's "conspiratorial approach," as unfortunate by-products of military rule. Of course, this is a matter of judgment, but a good case might be made to the effect that conspiratorialism and repression were central to the very character of the regime, negating in advance whatever steps (such as the celebrated "March

30 Program" of 1968) might be taken to liberalize the political process.

To my mind the greatest gap in Professor Dekmejian's analysis has to do with the impact of Nasser's socialist programs on Egyptian society. The programs themselves are outlined in 13 brief pages of Chapter 9, "The Nasirite Theory and Practice of Arab Socialism," followed by a passage of equal length on the accompanying ideological pronouncements. But with minor exceptions the author does not follow up by telling us what difference Arab Socialism really made to the Egyptians; and this is a pity, since ultimately we must surely gauge Nasser's legacy by his success or failure in lifting Egypt's face out of the mud of poverty and backwardness. "Given the predominantly middle-class and upper-middle-class background of the leadership and its middle-class revolutionary aims," writes the author, "the potential for class conflict in Egyptian society remains real" (p. 294). If so, we need to know much more about the emerging shape of social affiliations and interests than the book provides. Professor Dekmejian would doubtless be among the first to agree that this sort of information is important, but I suspect that his adherence to the ideologically antiseptic tradition of the American science of politics has tended to inhibit him, like others, from devoting more enthusiastic attention to the dynamics of class relations.

MALCOLM H. KERR

University of California, Los Angeles

Die KPD von 1933 bis 1945. By Horst Duhnke. (Cologne: Kiepenheuer & Witsch, 1972. Pp. 605. DM 72, or \$23.00.)

Professor Duhnke's account of the Communist Party of Germany in the years of its impotence is a valuable scholarly work in several ways. As a sequel to the works of Flechtheim, Angress, and others on the KPD in the 1920s, it carries the history of the party forward to 1945. Designed on a far more ample scale than the works of Hermann Weber, this book is, first of all, an impressively complete history of the KPD in this era. As far as this reviewer can tell, Duhnke has read every German-language source relevant to his topic. The book also provides massive evidence for the process by which the remnants of the once proud movement of Rosa Luxemburg became a dependent instrument of Soviet policy.

Duhnke amply documents the emergence of the Pieck-Ulbricht leadership that was to dominate the postwar party, and he does so in a wonderfully clear exposition of very tangled circumstances. The author shows how the very

weaknesses of the KPD, both practical and intellectual, in coping with the power of Hitler, worked to the benefit within the party of those leaders most responsive to Soviet demands.

Aside from the internal history of the KPD, this work also provides valuable material for the history of the German aspects of the emergence, fitful fulfillment, and decline of the Popular Front line. While here Duhnke's account will supplement a number of extant works (Buber-Neumann, Gross, Koestler, and Edinger, among others), it gives the most complete version of the KPD's difficult relationship with other German exile groups. One might have wanted a fuller treatment of the Trotskyist challenge to the KPD, as well as details of the fate of German Communists in Stalin's purges, if only for completeness in an otherwise unstinting work.

A theme running through this volume is the growing incoherence of the Communists' analysis of the reality confronting them. This fact, to an extent not sufficiently brought out by Duhnke, disarmed the KPD in the face of Soviet leaders who, while no better at understanding, had the power to avoid (until June 1941) the consequences of their errors. From the deadly foolishness of "social fascism," through the graveyard optimism of the first months of the Third Reich, during the superficial revision of the KPD line in the Popular Front phase, and in the hopeless "analyses" of the later years by a party increasingly out of touch with German life—Duhnke shows how at every step the German Communists found no adequate tools in their theoretical armory to understand the development of German life that had deprived them of their opportunity for power. Of course, some leaders (and followers as well) took comfort in dogmatic formulas, but that only increased their helplessness. The Communists were far from alone in this predicament, but they had staked the most—in lives, ambitions, and effort—on the correctness of their analyses.

This theoretical inadequacy of the KPD was matched by its practical lack of success. As Duhnke shows, perseverance, courage, and faith in ultimate success were insufficient to prevent the Gestapo from nullifying the Communists' efforts at building a KPD-led German resistance movement. Although Communist groups continued to appear to the very end of this era—the Leipzig-based group formed around Georg Schumann in 1943–44 was one of the most vigorous and interesting (although ultimately unsuccessful)—at no time was the Hitler regime in any measurable danger from

all of this heroic activity. Indeed, if one reads this part of Duhnke's book while bearing in mind Edinger's study of the exile-SPD, one is left with the rather surprising conclusion that, even though the KPD had an acknowledged party leadership functioning in Moscow, the personal and intellectual dispersion of German Communism after 1939 was not much less than that of its Social Democratic rival.

It is a measure of Duhnke's achievement that his book raises a number of interesting and important questions in the reader's mind. One such question concerns the nature of a modern mass-party and the relationship of the leadership of such a movement to the mass of supporters. One of the Communists' more plausible claims at the time of Hitler's accession to power was that a party with millions of members and millions more supporters, which could elect eighty-one deputies to the last Reichstag despite Nazi terror, was a party which could not simply be swept away. Yet swept away it was—almost as completely as the Nazi party was after 1945. This study describes some of the tactical reasons for this decline, for example, the lack of credibility on the national question so evident in the Saar plebiscite of 1935. More broadly, this study suggests that modern mass movements owe more to power and authority than to ideological appeals or social situation.

In this context, the KPD's Leninist "organizational weapon," appears less important. It certainly enabled the party to maintain contact with small and scattered bands of loyalists, and it allowed the KPD to dominate the prisoners' organizations of many concentration camps, but it had little consequence when it could not be deployed in the political process.

Duhnke shows in detail how the KPD grappled ineffectually with the agonizing problems of patriotism in the face of a despised regime in its homeland. Ultimately, the Communists took refuge in following the Soviet line. They denounced other foes of Hitler who hoped for an Allied victory during the early phase of the war, then attacked these rivals bitterly for demanding justice for the Germans when Soviet policy favored territorial and population shifts.

The chief problem with this book is that the voluminous record is allowed to obscure these and other larger issues raised sometimes in only tantalizingly marginal ways by the author. When this German-language version of a University of California, Berkeley, dissertation finds its deserved American publication, Duhnke might do some massive pruning (say, of the long discussion of underground and Red Army

espionage activity in wartime Germany) and close the work with a discussion of the significance of KPD's twelve years in exile, rather than, as now, simply breaking off the discussion arbitrarily.

HENRY KRISCH

University of Connecticut

Political Attitudes of Indian Industry: A Case Study of the Baroda Industrial Elite. By Howard L. Erdman. (London: The Athlone Press, 1971. Pp. 62. 22 shillings.)

Recently, the drift of American social science scholarship on India has been away from the village and into the towns and cities. As usual, such research has not devoted itself to the secondary analysis of materials already collected as it might in the United States, but has involved the collection of primary descriptive data, with a greater or lesser attempt to proceed systematically with analytic concepts leading back into the discipline and with an eye on comparable work done elsewhere.

Erdman's slim monograph reports on research he carried out in the Western Indian city of Baroda in 1966-67 on the political attitudes of business leaders. It is essentially descriptive, perhaps necessarily so in the absence of solid materials ready at hand, and makes few self-conscious attempts at systematization or conceptualization. To the extent that it is oriented to other literature, it attempts to correct earlier simplistic conceptions of business leaders as totally for or against the existing government, and to represent them along a continuum. Its primary focus is on political attitudes and not activity, and a basic economic determinism is invoked in explaining the origin of those attitudes.

Baroda emerges as a secondary business center, in the shadow of, but not completely dominated by Ahmedabad. Its leaders are primarily home-grown, although somewhat cosmopolitan in experience. Its industries are spread across that limited range that characterizes Indian manufacturers. And the social structure of its leadership is familial and hierarchical, not unlike the American business class as represented in Lynd's *Middletown*. In political attitudes, the Baroda industrialists approve of government actions in making land acquisition easier for them and the provision of cheap and dependable power. They disapprove the government's support of labor's position in industrial disputes because of the populist imperatives of contesting elections; an overgrown thicket of government rules, permits, quotas and licenses; and the government's habit of publicly breathing

the fire of theoretical Marxism, while finding pragmatic, capitalist solutions to specific problems. Overall, Erdman sees the viewpoint of the industrialists as close to the conservative Swatantra Party view, on which he is, incidentally, a leading expert; and he hints that they would welcome the creation of an authoritarian government less tied to the need for securing popular approval. In view of the current move toward a left-oriented mobilization state in India today, prayers may be growing more fervent.

I have only two small disappointments to register as criticism. First, it would have been helpful if Erdman had made a more deliberate attempt to place his findings in a slightly broader context of similar studies in other countries. Second, although Erdman interviewed a substantial number of business leaders, one looks in vain for even the most general indications of the degree of consensus on particular issues and some notion of what characteristics of leaders went with what attitudes. I am not trying to suggest an uncalled-for numerical precision, but the notion that cases must be many and measurement precise before general quantitative description is useful is one of the banes of case study research.

Erdman's work is a contribution to a still small, but growing literature concerned with Indian business elites, and as such it is very valuable.

RICHARD D. LAMBERT

University of Pennsylvania

From Crisis to Crisis: Pakistan 1962-1969. By Herbert Feldman. (London: Oxford University Press, 1972. Pp. 340. \$18.75.)

The present volume is the second in a projected trilogy by an Englishman long resident in Pakistan. Herbert Feldman has been writing about the Pakistan scene for almost the lifetime of the nation, and his work has enlightened a generation of students interested in South Asian politics and government. His earlier book, *Revolution in Pakistan: A Study of the Martial Law Administration* (London: Oxford University Press, 1967), is judged by Mr. Feldman to be a prerequisite to this "sequel." I would concur with this assessment, for the author's opening chapter reads almost like a continuation of that volume. Moreover, readers are already put on notice that the third volume in this series will begin where this one leaves off. We are introduced to Yahya Khan, Ayub's successor, in a brief epilogue, thus preparing the way for the ultimate sequence of Mr. Feldman's narration of the Pakistan tragedy.

Mr. Feldman writes as a close-in observer of the daily happenings in Pakistan. He informs his readers that he has kept a detailed diary of what appear to him to be significant events. His publications, like the one under review, reflect this concern for day-to-day detail, but his analysis is somewhat thin. The author's strength, therefore, lies in his long and abiding interest in Pakistan, and for this reason his latest contribution is worthwhile reading.

If there is a theme in *Crisis to Crisis* it is the transformation of Ayub Khan from a professional soldier with a flair for administration into a power-grabbing dictator. Ayub, asserts Mr. Feldman, insisted on surrounding himself with personalities who, while assisting in the building of his personality "cult," also isolated him from the realities of his society. Although I cannot quarrel with the observation that Ayub was poorly or erroneously advised, Mr. Feldman's suggestion that Ayub was obsessed with power appears overstated. The author tends to focus on Ayub's "personality" and the conflict over the legal system, not the administrative state over which Ayub officiated but clearly did not subordinate to his will. I believe that greater attention should have been given to Ayub's dependence on the Army and higher bureaucracy. Mr. Feldman neither analyzes their more than supporting roles, nor for that matter, explains the constraints which the colonial bureaucratic legacy imposed upon Ayub. Ayub is a beneficiary of the preindependence system, hardly its master. Moreover, the perpetuation of the agrarian power structure and the traditional norms reinforcing it are overlooked in Mr. Feldman's treatment. Ayub Khan was a dominant actor, but despite repeated references to his imposing a dictatorship on Pakistan, the evidence thus far assembled seems to have been stretched to satisfy popular perceptions.

No one expects Mr. Feldman to be an apologist for Ayub. The failures of Pakistan's erstwhile President are too obvious and too gross for any objective scholar to sing his praises. Nevertheless, Mr. Feldman does appear to apologize for Ayub's actions in his *Revolution*, whereas, in this volume, he seems only too willing and ready to pillory him. Moreover, the author reads special significance into the amending of the 1962 constitution. While recognizing that this was Ayub's constitution, he seems to suggest that had Ayub not tampered with it, he would have been a far more successful governor. Notes Feldman: "... the longer-term effect of all this [amending] upon his political position was a decisive factor in his ultimate fall" (p. 23). It is difficult to believe that the

constitution would have been any more acceptable to the intelligentsia had Ayub not interfered. The constitution which the attentive public clamored for was not granted, and that which Ayub's administration imposed upon the country was condemned from the start. Furthermore, despite all the demands for a written constitution in Pakistan there is little evidence that one would be revered over another. In Pakistan, the use of arbitrary power tends to be limited more by conditions than by constitutional principles, and even that which passes for the "rule of law" survives because it is in tune with the reality of power.

Mr. Feldman writes with clarity and labors to omit little from his narrative of these crucial years in Pakistan's history. The book is divided into fifteen chapters, each of which highlights a significant period or event. In the main the author's treatment is chronological; however, he also attempts to be topical, as when he devotes separate chapters to West and East Pakistan. In the latter there is ground for criticism. Given subsequent events and the publication date of this volume, the treatment of East Pakistan must be judged skimpy, and it is not fully incorporated in the text. Twenty-two pages in a text of 299 hardly does justice to the subject. The author's treatment of Pakistan's foreign relations and especially those with India is welcome, but there are questionable passages such as the prediction of little chance for an early renewal of Pakistan-Indian hostilities after the 1965 conflict. Mr. Feldman's belief that "India is too deeply concerned with internal political troubles which threaten its integrity as a single, sovereign state" (p. 118) is falsified by the events of 1971. Perhaps it can be argued that the 1971 drama was unpredictable. Nevertheless, a more thorough examination of the East Pakistan problem and greater awareness of the east wing's relationship, even if only indirect, to the turbulence in Indian Bengal, Assam, and the tribal territories might have prompted a different conclusion.

Hence we arrive at the principal criticism of the book: Mr. Feldman could have produced a more important and timely work had he included the Yahya Khan period in *this* volume. This would have necessitated a more coherent analytical framework (and perhaps further delays in publication), but it also would have brought forth a more notable contribution. As is, the author set his sights on condemning Ayub Khan as a bumbling dictator. This determination, unfortunately, has prevented Mr. Feldman from giving his readers the larger benefits of his long and informed experience but he

has provided us with an important chronology of the decade of Ayub.

LAWRENCE ZIRING

Western Michigan University

A Guide to Parliamentary Papers, 3rd ed. By P. Ford and G. Ford. (Totowa, N. J.: Rowman and Littlefield, 1972. Pp. xiv, 87. \$8.50.)

Varied and rich as they are as sources for the analysis of policy making, British parliamentary papers in their many modes are apt to confuse the unfamiliar user. One's best guide is still a well-informed documents librarian. Lacking that, those new to these mysteries should consult the latest edition of the Fords' guided tour of parliamentary documents, appropriately subtitled "What They are; How to Find Them; How to Use Them." It updates the Fords' earlier work by including references to the changes in parliamentary structure and publication procedures made in the 1960s, and contains some new bibliographical aids. A somewhat musty work, it is nevertheless a must for reference libraries (though at the price few individuals will want or need to acquire it for themselves).

JAMES B. CHRISTOPH

Indiana University

Soviet Prison Camp Speech: A Survivor's Glossary. Compiled by Meyer Galler and Harlan E. Marquess. (Madison, Wis.: University of Wisconsin Press, 1972. Pp. 216. \$10.00.)

By now millions of Soviet citizens have had either direct or indirect exposure to prison dialect, and it appears frequently in work by dissident writers circulating in underground (*samizdat*) copies. Those interested in repression and opposition, political culture (especially the symbolic aspects of political communication), and Soviet politics in general will therefore find this book useful for several purposes. The six hundred and fifty-six items in the glossary detail physical conditions, norms, and values of prison and camp life. A useful forty-two page introduction gives background on the development of the dialect, some of its functions in the system of repression, a short content analysis of glossary terms, and a list of useful references. Compiled jointly by a former camp inmate and a scholar of Russian language, the book is limited in scope to those terms Galler encountered during his years (1942-1957) in Central Asian camps supplemented by some from the writings of Solzhenitsyn who served time almost simultaneously (1943-53) in roughly the same place.

A special vocabulary which can be adopted

by anyone speaking Russian, camp slang is described as a "... substandard variety of Russian ... 'tainted' by legal and administrative argot, obscenities, and frequently, by elements of uneducated peasant speech" (p. 15). Proverbs and sayings are most revealing of the basic concerns of prisoners and everyday conditions, particularly the morality of camp life and dealings with authorities. Profound alienation and a cynical despair is implied in such expressions as "Provided we've got the man, we can find a charge for him," and "Moscow does not heed tears." "He who can will swallow you" pertains more generally to the quality of life within the camps, and "Having nine lives, like a cat" refers to the remarkable resistance of female prisoners to camp life. Acronyms show political categorization and, therefore, help to delineate the legitimate boundaries of Soviet political culture. ZhVN, standing for "Wife of an Enemy of the People," betrays what Inkeles has termed the "virus theory of social pathology" ("The Totalitarian Mystique" in his *Social Change in Soviet Russia* [Cambridge: Harvard University Press, 1968]), providing the basic justification for the purge: once the social organism is contaminated, the absolute elimination of all carriers (the potential "enemies") is required. "Guilt by association," another common feature of the purge mentality, dictates that marriage to an "enemy" constitutes a state of contagion as well. Obscenities constitute a rather prominent feature of camp speech and are important from two points of view: For prisoners they serve as a mild form of open rebellion, while for authorities they are an instrument for downgrading and brutalizing their charges. "Call me a chamber pot but feed me" is the prisoners' pathetic expression of resignation to their impotence. A residual category of terms include specific references to the grim conditions of camp life; *výshka*, a death sentence or a watchtower; *vozhátiy*, a guard in charge of watchdogs; *podkidysh*, a "plant" or informer; and *samorúb*, one who maims himself in order to avoid hard labor and possible death from exhaustion. Still more of the grim tone of life "inside" is reflected in the examples of how words are used: for "stukách" (squealer or informer), "last night a squealer in our barracks had his throat cut."

To be sure, the facts and flavor of camp life reflected in this glossary and its long introduction can also be gleaned from fictional and autobiographical accounts; but there is special merit in the more systematic list accompanied by specific explication. Particularly interesting is the attempt to estimate the relative numerical

strength of various content categories in camp terminology. Here the most important categories seem to be: names for fellow prisoners and authorities, 23 per cent of the total; terms referring to locale of prisons, 16 per cent; survival-oriented terms, 16 per cent; expressions relating to arrest and investigation, 14 per cent; and terms of abuse and derision, 11 per cent (pp. 36-37).

As the authors note, the gallows humor which repeatedly crops up in proverbs, sayings, and terms of decision must help "to reconcile man to the painful, unacceptable, and tragic aspects of his condition" (p. 37). Particularly expressive in this regard are the mutations of official slogans which constantly haunt both prisoners and everyday Soviet citizens as well. For prisoners "Being (*bytiyé*) determines consciousness" becomes "Beating (*byt'yó*) determines consciousness" and "Socialist vigilance (*bditel'nost'*)" becomes "Socialist farting (*bzditel'nost'*)." Of course, such safety valves serve not only the prisoners but the regime as well, by slowing down the accumulation of collective frustrations which might hinder the smooth functioning of the coercive apparatus.

While Galler and Marquess make tantalizing beginnings at discussing some of the important theoretical considerations the content of their book raises, they do not carry through with much systematic speculation. This omission, however, seems to result more from their own backgrounds and the original conception of the project than from its faulty execution.

Hampshire College

L'An 40: La Belgique occupée. By J. Gérard-Libois and José Gotovitch. (Brussels: Centre de Recherche et d'Information Socio-politiques, 1971. Pp. 517. \$10.75, paper.)

Scholars interested in the political development of Western Europe often surrender the World War II period to military historians or memoir-writing notables. The connection between the war years, 1939-1945, and their sequel has not received much attention, possibly because of the belief that wartime disruption destroyed most patterns of political behavior. A major contribution of the lengthy and detailed study under review, *L'An 40*, is the explicit recognition that awareness of the events of World War II, specifically those of the crucial year, 1940, within Belgium, significantly extends our understanding of contemporary Belgian political structures and processes. There is no attempt to argue this case for other countries, which would at least entail a choice of different

time frames, but the book itself is a convincing example for other specialists.

L'An 40 is the most recent of the full-length studies published by the Centre de Recherche et d'Information Socio-politiques (CRISP), well known among African specialists in the United States for its exhaustive dossiers on the Congo (some published by Princeton University Press) but recognized among only a few scholars for its distinguished analysis of nearly all aspects of Belgian politics. Jules Gérard-Libois, the leading figure in the establishment of CRISP in 1958 and presently its Director-General and his younger associate, José Gotovitch, bring to the study of the German occupation of Belgium a thorough review of the relevant secondary literature, a ground-breaking examination of the pertinent German archives, and a quantity of published and solicited memoir material. The description of Belgium's reactions to occupation in 1940 reflects several of the customary theoretical concerns of CRISP such as the mechanics of decision making, leadership recruitment, the structure of public opinion, and the morphology of groups. As a result, the perspective on the German occupation sharply diverges from the few other available accounts.

There is a rich treasure of information in this volume for those fascinated by Belgium or any other small European democracy and also for the more numerous students and scholars concerned with German politics, especially Germany during the Hitler period. Viewing the German occupation from the Belgian side makes it easier to detect the army/party/government conflicts concealed by some popular writings on the Nazi period. Unlike Holland or France, Belgium was placed under a military administration and ruled indirectly, the cause of much quarreling among the untidy chains-of-command of the German hierarchy. The book is equally informative in tracing the evolution of opinion toward the occupying administration in all sectors of Belgium's pluralist polity. It is true, of course, that collaboration existed alongside the Resistance in Belgium. Nonetheless, in roughly a five-month period, especially during the harsh winter famine that occurred in the latter months of 1940, the preponderance of public opinion swung from collaborationist tendencies to general hostility, a basis for diverse forms of clandestine activity in the rapidly organizing Resistance groups. Tracing this shift, scarcely affected by the activity of the exile government in London headed by Hubert Pierlot, is one of the major achievements of the study. The discussion of "collaboration" (a term almost entirely confined to polemical usage in the United

States) fairly takes account of the Nazi effort to capitalize on the permanent tension between Flemish and Walloons in Belgium.

L'An 40 displays an admirable freedom from partisanship in the treatment of events and personalities whose memory can still evoke a full range of emotional response among Belgians. The only explicit point of view adopted by the authors is revealed in the governing hypothesis that the "occupation brought into play the same political, economic, social, and cultural forces which fashion Belgian society in normal times" (p. 9). But a crucial difference exists in observing those forces at play in 1940 and today because war and occupation exacerbate "the natural tensions in society and furnish a privileged source for socio-political observation" (p. 9). The entire book makes a carefully documented and persuasive case for this view. The immediacy and influence of the events of 1940 on present-day Belgium are largely matters for speculation. It should be recorded, however, that *L'An 40* has developed into a publishing event in Belgium. Within a year of its appearance, it had entered its fifth printing and led to a brief sequel also published by CRISP, *Commentaires et Réactions*, a collection of reviews and other communications commenting on the book.

An omission of *L'An 40*, recognized by the authors, is any extended discussion of the impact of military developments on the political situation. For many political scientists, this gap is not as disconcerting as the failure to discuss directly the consequences of the availability of and access to interview sources and correspondents. There is also an occasional confusion between the opinions of sources and the analytic interpretations by the authors. These criticisms do not weigh heavily when placed in the context of the author's three-year effort in researching and writing the book, the need to maintain the confidentiality of some interview respondents and, particularly in the case of the senior author, a remarkable knowledge of Belgian personalities, groups, and political issues. The scope of this account of occupied Belgium during the first crucial year of World War II, the excellence of the historical and political analysis in each chapter, and the opening of important research vistas contribute to a work that merits a wide readership.

HOWARD BLISS

Vassar College

Manpower for Development: Perspectives on Five Continents. By Eli Ginzberg. (New York: Praeger Publishers, 1971. Pp. 331. \$10.00.)

Eli Ginzberg, of Columbia University, is one of the central figures in manpower analysis in the United States. In this book he skillfully analyzes the economic, political, and manpower realities of his subject matter and how they interrelate. The book deals with manpower and related problems and prospects in twenty-seven countries as varied as Ethiopia and Sweden and as diverse in population as India and the Bahamas. It is based on the author's field studies since 1964 on five continents, and all except the first and the last chapters are based on his earlier publications.

The first chapter proffers as the focus for the book "the ways in which the leaders of those several countries have shaped their manpower policies with the aim of realizing their development goals" (p. 3). It then sets out as the "analytical schema" four categories of forces which determine a nation's human resources: the value system, the political structure, the economic organization, and the component parts of the manpower system itself. Unfortunately, the promise of a unifying focus is seldom attained. Ginzberg paints with a very broad brush but with quite different hues for the different countries with which he deals in any depth. The particular hue seems to reflect more often the author's impressionistic evidence than his concern for analysis under the schema he set forth. Nowhere does he draw explicitly on the work of others.

On many important matters, such as the nature and quality of Asian universities, which is the sole subject of Chapter 7, he offers very little substance on which to base his conclusions. His discussion of the universities of five countries covers a mere ten pages, of which less than two deal with India. Surely even Ginzberg's keen insight was sorely taxed to produce valid generalizations on such an important subject on the basis of his brief impressions and anecdotal experiences.

Such a work is valuable for its breadth of coverage rather than for its analytical depth. It is reassuring that the broad brush is wielded by so accomplished a painter. At times, however, his brush becomes so wide in covering broad economic and political development and prospects that the manpower content is relegated to insignificance. Such abandonment of his theme is particularly evident in Chapter 14, "The Eastern Block," wherein Ginzberg devotes twelve pages to Yugoslavia, Bulgaria, Czechoslovakia, Hungary, and Rumania, mainly in praise of market-oriented economic systems over the directed economics of those countries. What little he does with manpower in this chapter is not well done; for example, after

acknowledging that these five countries are very different, he nevertheless attempts to characterize in one short paragraph "the educational system." In spite of Ginzberg's emphasis on the critical importance of institutions, his lengthy chapter on Israel merely mentions the Histadruth, despite the fact that this "government within a government" is that country's most significant and unique institution in manpower and in many related areas.

Ginzberg develops several themes which have often been neglected in discussions of manpower and economic development, e.g., the important role of the military in training leadership and manpower, the importance of management, the neglect of women as a manpower resource, and the negative as well as the positive aspects of foreign university training and of foreign firms in manpower development and utilization.

With few exceptions he finds that the higher educational systems of countries at every level of development are producing more high-level manpower than the countries can effectively employ, and that this increases discontent and political instability. Ginzberg gives scant recognition, however, to the fact that such general overproduction often disguises persistent and critical shortages of many high-level skills, particularly administrative skills for the public and private sectors, which continue to impede development in most countries.

Ginzberg correctly advocates the development of on-the-job training by public and private organizations as essential to the development of needed skills. He properly criticizes ineffective vocational education as a general problem. But in his chapter on Venezuela he misses the opportunity to offer as a contrast that country's innovative and generally successful system of vocational education (INCE). Ginzberg's one-paragraph discussion and analysis (p. 267) is not only superficial, but it also misleads the reader about INCE's role and effectiveness.

The author repeatedly stresses the importance of rural development as an essential alternative to urban overconcentration. Although many others have discussed this problem, Ginzberg's wide coverage of countries points up the generality of such a problem regardless of countries' vastly different characteristics and levels of development.

To this reviewer the main value of the book is its knowledgeable treatment of economic, political, and manpower circumstances, institutions, problems, and prospects as inextricably interrelated. What Ginzberg's treatment lacks in depth it more than makes up for by high-

lighting those important elements in the development and utilization of manpower which are common to very diverse countries.

JOHN C. SHEARER

Oklahoma State University

Naissance d'un Etat Noir: L'évolution politique et constitutionnelle du Dahomey, de la colonisation à nos jours. By Maurice A. Glele. (Paris: R. Pichon and R. Durand-Auzias, 1969. Pp. xii, 527. Approx. \$10.00.)

Since independence in 1960, Dahomey has manifested chronic political instability under seven different presidents and four constitutions. Its highly politicized and faction-ridden army, seething with personalist ambitions, has already staged six successful coups and has become the primary destabilizing force in Dahomey today. Civil and military authority has also had to cope with increasingly radicalized assaults by primary and secondary school students and by unionists whose salaries have been eroded by austerity measures aimed at reducing civil service expenditures from the level of 75 per cent of the country's budget.

Maurice Glele's book is the first detailed study of Dahomey since Robert Cornevin's historical work in 1962. The author is a Fon from the Abomey royal family; he studied at the Sorbonne and is currently with UNESCO. During his research he has had access to many of the private archives in Dahomey and writes with the lucidity of one personally familiar with the major participants in Dahomey's long history of political strife. The narrative prudently ends with the onset of Soglo's military administration in 1965. The work is hence quite dated, for Dahomey has since had six additional civil and military regimes. The study is nevertheless a solid contribution to our knowledge of the Dahomean political context.

In his study Glele traces the political and constitutional evolution of Dahomey and pinpoints factors that have contributed to the pattern of acute political instability in this small West African state. Among these factors he notes the existence of intense vertical cleavages reinforced by historic antagonisms in the South, grievances in the less developed North regarding its exploitation by the South as a whole; the coalescence of regional allegiances around three leaders—Ahomadegbe, Maga, and Apithy—who have maintained for two decades an electoral stranglehold over their respective fiefdoms; a weak economy with exports never covering more than 45 per cent of imports; recurrent deficits necessitating austerity measures which disturbed unionists; dependence upon French subsidies, alienating radicalized stu-

dents; government mismanagement of resources; personal ambitions in conditions of acute scarcity in the country that had produced the largest number of intellectuals and administrators in French Africa; and above all else, a failure of civilian leadership to coalesce and to move in the direction of national integration and economic development. Glele does not shy away from harshly indicting the Dahomean political elite. He is understandably biased in favor of Ahomadegbe (also of Abomey), because of Ahomadegbe's greater dedication to national unity and modernization. More annoying is the excessively strong language Glele employs in driving home his conclusions, rather than letting the facts speak for themselves.

The author's searing analysis of the failure of political leadership in Dahomey also challenges the meaning and utility of elections or plebiscites in that country, which merely serve to reiterate the links between the masses and their regional political "bosses." Yet curiously, when Glele turns to prescriptive advice, his proposals are somewhat out of touch with Dahomean social reality. It is doubtful if the executive system and the nontribal parties he pleads for could survive Dahomey's traditional pattern of voting, especially since they would go against the current three-cornered division of power in the center. The stability over time of the clientelist vote was indeed attested to in 1970 when the triumvirate obtained *exactly* the same percentage of the vote in their core districts as in the 1960 elections, while Zinsou, the nontribal "modern" candidate obtained only 3 per cent of the vote. The solution to Dahomey's political problems cannot be sought in structural changes that leave untouched the underlying cultural cleavages and do not take into account the conflicting political ambitions in the center of the political vortex. Indeed, Glele's analysis itself underscores the complexities involved in establishing public and political order in this African State.

SAMUEL DECALO

New School for Social Research

The Twelve-Year Reich: A Social History of Nazi Germany. By Richard Grunberger. (New York: Holt, Rinehart & Winston, 1971. Pp. viii, 834. \$10.00.)

As we recede from direct experience of the Third Reich, and direct emotional involvement in its existence, we find the generalizations with which we explained its nature and origins less and less satisfying. Those who voted Nazi, those who joined the party, those who benefited from the regime, those who opposed it do not

fall into simple categories. On many topics the Nazis had no policy: Had not Hitler made a virtue of being unencumbered with programs? On others their proclaimed ideals turned out to be sadly irrelevant: A woman's greatest joy might be to sew, cook and wear the Honour Cross of the German Mother, but who was going to make the munitions and drive the streetcars while the men were at the front? On others still, such as the churches, the army or capital-labor relations the party was divided and confused. The party itself never grew out of the habits acquired during the "time of struggle"; it remained a loose alliance of egotistical chieftains and mutually incompatible sectional interests, whom Hitler played off against each other. The Third Reich was less a system than a chaos. This does not mean that it is unanalyzable; David Schoenbaum's *Hitler's Social Revolution* and Martin Broszat's *Der Staat Hitlers* analyze society and political institutions brilliantly without losing sight of the improvisatory incoherence of their subject. It does mean that the chronicler of the Third Reich cannot be content with mere description, in the hope that the facts will speak for themselves.

It is the chief defect of Mr. Grunberger's massive and well-researched volume that it lacks a framework. His book is the sum of its parts, and though some of the parts are good, they do not really justify the 800 pages he has written. There are plenty of worthwhile insights. He warns us not "to discount the reserves of idealism tapped by the propagation of the idea of the folk-community" (p. 51). But the combined appeals of the gospels of collective selfishness and egalitarian sacrifice had curious effects: Evacuees from bombed cities complained that possessions stolen from the Jews had been unfairly distributed, and there was always an excess of volunteers for military firing squads, whereas the U.S. Army had the utmost difficulty in getting its most famous deserter, Private Slovik, executed.

Some of the chapters dealing with individual aspects of life in the Third Reich are excellent summaries, e.g., those on agriculture, the army, and consumption. Some are misleading, e.g., those on women and family. One would not gather from this volume that, given the conditions of total war, German women were rather sheltered and cosseted, as Speer and others have pointed out. The illegitimacy rates Grunberger cites seem to prove nothing in particular. And was the crowd who urged an unwilling woman to give herself to a threatening Russian soldier (p. 43) uniquely characteristic of the Third Reich? Mr. Grunberger

should read Maupassant's *Boule de Suif*.

There is a lot of imprecise language. Why call Imperial Germany "pseudo-constitutional" (p. 2)? Its brand of limited monarchy is precisely what many continental Europeans thought of as 'constitutional,' as opposed to parliamentary or democratic government. We are told that "the Party was co-terminous with the state" (p. 130), but that "by and large the Party and the civil service remained distinct" (p. 132). And the identification of workers with the Third Reich in its last years must be ascribed to something other than their *embourgeoisement* (p. 201).

Despite its wealth of information and shrewd comment, the book shows an opportunity lost. The author has read widely, even if not always in the best sources. It is not an original book, but that does not matter. That there is a vast demand for a work that will explain Nazi Germany to the non-specialist reader was shown by the sales of William Shirer's amateurish *The Rise and Fall of the Third Reich*. A good synopsis of how the Third Reich functioned is more important than reading another fifty microfilmed security reports. But synoptic is not the word that *The Twelve-Year Reich* suggests to the reader's mind.

PETER PULZER

Christ Church, Oxford University

The Social Foundations of German Unification, 1858-1871: Struggles and Accomplishments.

By Theodore S. Hamerow. (Princeton, N.J.: Princeton University Press, 1972. Pp. 456. \$15.50, \$7.95 paper.)

This book completes the two-volume work by Theodore Hamerow, professor of history at the University of Wisconsin at Madison, on the social foundations of German unification. The work covers the period from 1858, when Prince William became regent of Prussia, to the formation of the German Empire in 1871. The first volume, subtitled *Ideas and Institutions*, appeared in 1969; it dealt systematically with the social structure, ideologies, and political forces of pre-imperial Germany. The present volume is a chronological account of the arrays of forces on various issues whose resolution led to the formation of the Empire. Drawing on biographies and memoirs, official documents and statistics, the press, and the propaganda output of parties and interest groups, Mr. Hamerow has produced a technically sound, gracefully written history.

His main point is that the political and economic order that had emerged in Germany by 1871 to last for nearly half a century was a re-

sult of a compromise between old and new capital in which the new industrial bourgeoisie accepted economic liberty without political rights and the old landed aristocracy sacrificed its corporatist ideology but retained its power and property. The immediate cost of abolishing the legal structure of a corporate economy was borne by the handicraft workers. But even before the legal basis of *laissez faire* was established in North Germany during the 1860s, industrialization had made major inroads. Mr. Hamerow shows that the law merely speeded up an inevitable process.

The same bourgeoisie that required economic freedom at home desired freedom of movement for persons, goods, and capital abroad. This was as true of the South German as of the North German bourgeoisie. In the South, however, the bourgeois proponents of German economic integration encountered strong opposition from governmental officials justifiably wary of Prussian domination. Indeed, the author contends that it was Otto von Bismarck who saw how far economic integration could be pressed, and who created a political order in which it occurred under the control of Prussia.

Readers familiar with the contemporary movement for economic and political integration in Western Europe may be struck by the similarity between the Rome treaty and recent plans for economic and monetary union on the one hand, and Bismarck's aims, first for the German Confederation (which included Austria), then for the North German Confederation (formed in 1867 by the states north of the River Main). Though Bismarck went further, advocating a common navy and a common system of civil law, he shared with the proponents of West European integration a desire for uniformity in tariffs, money and banking, the conditions of transportation and the migration of workers, and similar matters.

That the regulation of such matters fell, in the North German Confederation, to a Reichstag elected by equal manhood suffrage was due not just to the fact that the bourgeoisie stood to benefit most immediately from economic integration. It was due rather more to Bismarck's desire for democratic legitimization. Mr. Hamerow shows that, by creating a popularly elected legislature and occupying it with economic matters, Bismarck could achieve the appearance of democracy without granting a bill of rights, ministerial responsibility, or a parliamentary voice in foreign and military affairs.

Strictly comparable data are of course un-

available, but the desire for economic and political integration seems to have a broader base in Europe today than it did in Germany a century ago. Moreover, there is an active European bureaucracy in Brussels, conscious of its duty to carry out the Rome treaty. But until the integration movement acquires the force of a Bismarck backed by expanding industrial capitalism, one might question the extent to which it will make further advances, particularly in the political sphere.

Parts of the book are excellent political science. One thinks of an analysis of the elections to the constituent assembly of the North German Confederation and of several extended efforts at generalization on the social bases of political forces. This is a minor point, but I wish *Stand* (estate) had not been rendered as social class, a translation that does credit neither to the niceties of social-scientific terminology nor to the nuances of corporatist thought.

GLENN N. SCHRAM

Marquette University

Scottish Nationalism. By H. J. Hanham. (Cambridge: Harvard University Press, 1969. Pp. 250. \$5.50.)

It is perhaps unfortunate that since the publication of H. J. Hanham's book the fortunes of the Scottish National Party have waned. At the time that it was completed, the S.N.P. had made broad electoral inroads into both major parties in Scotland and had captured a parliamentary seat at Hamilton. To many observers the apparent success of a political party claiming to represent the national patrimony of Scotland seemed perfectly logical at a moment when Britain's Ulster dilemma was intensifying. Sharing this optimism concerning a rebirth of nationalist sentiment in the peripheries of the United Kingdom, Hanham traces the historical and institutional roots of the movement in Scotland. The decline in S.N.P. performance during the past several years, however, seems to have confirmed what should have been discerned at the time—namely, the assumption that there was a nationalist revival and the further assumption that the S.N.P. represented such a movement were illusions. We must now conclude that at least one of the two assumptions was mistaken.

Hanham's theme is that Scotland has "all the characteristics of a distinct nation" (p. 15) and that "a new Scottish system of government has come into being which with little modification would be capable of providing the basis for an independent Scottish administration" (p. 50).

It is apparent early on that he has overlooked the very essential distinction between "state" and "nation" and has failed to show how the presence of either one must of necessity lead to the other.

The book describes faithfully those institutions and patterns of thought that are typically Scottish and illustrates their historical development. Yet the author fails to make a convincing argument that these institutional and intellectual tracings have been converted into a popular nationalist movement. "In Europe," he asserts, "the normal basis for nationalism is the historic nation" (p. 10). That such historical determinism permits him to declare that when independence comes the Scots will be prepared to govern themselves is debatable; that it permits him to infer that Scottish nationalism has become a major political force is dubious.

The first section of the book is intended to show the historical distinctiveness of Scottish institutions. Hanham's treatment of Scottish history before the twentieth century, although perhaps overemphasizing separatist currents of thought, is nonetheless a balanced one. The author recognizes that Scotland has never been characterized by the homogeneity that some romantic nationalists have ascribed to it but rather has been plagued by recurrent fissiparous tendencies rooted in ethnicity, geography, religion, and economics. It is when he seeks to find continuity between historical nationalism and contemporary electoral politics in Scotland that he is treading on softer ground. Nowhere does the confusion of dispassionate analysis and political commitment become clearer than when in discussing the "anglicization" (or is it "modernization") of Scotland, Hanham concludes that "what most troubled thinking Scots was that the ordinary Scottish man-in-the-street . . . seemed to welcome the fact that he could now get in Scotland the advantages his southern counterparts enjoyed in England" (p. 47). It is almost as though Hanham were a Marxist confronted with the failure of the "inevitable" revolution to materialize. At such points the reader is uncertain whether Hanham is *describing* a nationalist rebirth or is *calling* for one.

Elsewhere it is equally difficult to distinguish the author's empirical analysis from his own values. He argues, for example, that "what makes the demand for Scottish control of Scottish affairs so persuasive is that since 1918 the Scottish economy has gone through a very testing period" (p. 29). We are left uncertain as to whether economic deprivation is causing a resurgence of nationalism or whether it simply

justifies such a phenomenon. One could argue after all that the Scots have been subject to economic bias from Whitehall. Since the demise of the Empire and the impoverishment of nineteenth century industries like shipbuilding and coal mining, Scotland has fallen upon lean times. The relationship, however, between Scotland's economic and political conditions is unclear.

In recent years political support for the S.N.P. has varied with the severity of unemployment and inflation. Yet, much of this variance can be accounted for in heavily Labour areas (such as the urban Clydeside) during Harold Wilson's tenure of office. This phenomenon probably represents less a direct translation of nationalist sentiment into S.N.P. votes than a protest vote against Westminster among those Labour supporters ideologically unable to cast their votes for Tories. The more consistent sources of S.N.P. membership have been in wealthy and rural pockets of the country, notably in the Highlands and Borders. This trend, unseen in aggregate voting data, indicates increasing localist sentiment directed against Edinburgh and Glasgow as well as against London. These conclusions are buttressed by the appeal which the decentralized and parochially oriented S.N.P. branch organization has had in small towns and villages and by the relatively greater electoral success enjoyed by the party in municipal and parliamentary by-elections as opposed to General Elections.

As for the normative aspect of the economic argument, Gavin McCrone has shown that Scotland would not benefit from independence and that English money has prevented the gap in wealth between England and Scotland from growing larger than it is. But even were Hanham's inferences valid, the argument that relative economic deprivation leads to nationalist sentiment is by no means uncontroversial. Indeed, as the author's description of the "anglicization" of Scotland (pp. 33-49) suggests the reverse process may historically be more accurate.

Scottish Nationalism contributes to our understanding of Scotland's past and reminds us that constitutional and national issues are not confined to Africa and Asia. The book, however, lacks the theoretical underpinning that would permit us to assess Scotland's present and future. While emphasizing Anglo-Scottish differences, the author underestimates the very concrete integrative factors binding British society. Unless the reader shares Hanham's very real attraction to the notion of an independent

Scotland, he will find it difficult to accept the historical determinism which the argument implies.

RICHARD W. MANSBACH

Rutgers University, New Brunswick

Spatial Dimensions of Development Administration. Edited by James J. Heaphey. (Durham, North Carolina: Duke University Press, in cooperation with the Comparative Administration Group of the American Society for Public Administration, 1971. Pp. xii, 276. \$8.50.)

This is the sixth in the series of volumes in which the Comparative Administration Group has reported the work of its research seminars held during the 1960s. Like all the other volumes, it is the collaborative effort of a number of senior scholars (who assembled at the University of Pittsburgh in 1965), though each person's work is clearly identified in separate chapters. Trying to head off the reader who will proceed no further because this is just "another edited volume, held together only by the binding," let me report immediately that the present work is well worth one's attention. Its weaknesses with regard to focus and continuity, though surely visible, are no greater than in many works written supposedly by a single author. I admit that since I have contributed chapters to five different "edited volumes," my credibility might well be impeached. But I am also on record in this *Review* of having thrown, if not stones, at least some small pebbles at other people's glasshouses, i.e., "edited volumes."

In addition to the introductory and concluding chapters by the editor (pp. 3-31 and 260-271), the five substantive chapters of the volume span the spatial dimensions from the small confines of Indian and Pakistani villages with their unchanging faces (by Henry C. Hart, pp. 39-90), to the megalopoli of the post-industrial age (by Bertram Gross, pp. 216-259). In between we encounter a careful recounting of the American experience seen as "development" (by Emmette Redford, pp. 91-131), the spatial aspects of Soviet administration (by Jerry Hough, pp. 132-175), and an examination of the spatial patterns of human resources movements (by John C. Shearer, pp. 176-215).

In his opening chapter, Professor Heaphey develops a series of six themes which, he claims, are touched upon in some measure by the subsequent studies (p. 30). Only two of the five deal directly with "development"; the others suggest spatial aspects of political systems

as a whole ("How the nation state must be spatially unified while allowing for spatial innovation," and "How placement of people affects development"), or of elements of the political system such as political ideology, political elites, and political culture. If anything, Heaphey is too apologetic for the work of his group. To be sure, "space" and "development" were not specifically defined anywhere in the volume, but there is really not much doubt in anybody's mind that at least "space" has been treated as a "primitive," and that the general notion of development administration is close to that of Edward Weidner, as quoted by Bertram Gross in his essay: "the term suggests the problems associated with innovational programs that upset traditional social processes" (p. 217). One wishes that Heaphey had sought out what is implicit in these studies, instead of pursuing only the explicit themes displayed by the various participants.

The five substantive chapters have characteristics and qualities which please as well as annoy; in some instances the same qualities manage to do both. The essays are attractive because they are the work of specialists who are looking at things they know well and try to ask questions about the significance of the spatial aspects of the phenomena with which they are concerned. Obviously, they do not share a common framework, and they do not subscribe to a single Kuhnian paradigm; they don't even look too closely at development administration, in some instances. But because they know well what they are examining, they speak with insight and imagination.

But this very preoccupation with their "hobbies" becomes annoying because the reader is left to puzzle out for himself what is the relevance for development administration of each author's contribution to the volume. Fortunately, at least one of them (Henry Hart) has made a serious effort to codify his findings systematically. In one other case, the essay is simply a long narrative in which the systematization promised at the outset is never delivered; unfortunately, Emmette Redford must be cited here. The other three cases fall between these two extremes. I would rate Jerry Hough's study of the Soviet experience second only to Hart's chapter on village development in the Indian subcontinent. (The larger work from which this chapter is drawn has also been published as *The Soviet Prefects: The Local Party Organs in Industrial Decision Making* [Cambridge, Massachusetts: Harvard University Press, 1969]). Hough does not present his findings nicely packaged in a series of propositions as Hart

does, but he is sensitive throughout the study to his obligation to development administration as well as to possible "lessons" to be learned from the Soviet experience by the developing world. Though John Shearer's contribution is limited entirely to Latin American data and findings, he does attempt to suggest a number of conclusions which might be examined in other parts of the developing world, for he has found that the movement of high-level human resources is from the poor to the rich countries and constitutes, in effect, a subsidy of the rich by the poor. The relevance of these findings for development administration seems obvious, but Professor Shearer has not really explored them systematically. Finally, on turning to Bertram Gross's contribution, one leaves far behind the mud of Pakistani villages and the primitive cities of provincial Russia, to follow the author to whatever mountaintop he has picked to view the "birthpangs of a world society" (p. 247). To be sure, who would quarrel with the proposition that industrial man has conquered space—if we do no more than count the astronauts we have sent to and brought back from the moon since 1965, when these essays were written. But we are entitled to ask in 1973 in what way and to what degree we have advanced one inch towards the potentialities of the new individualism Bert Gross promised us (pp. 258–259).

Given the nearly free-form quality of this volume, it is no surprise that one of its central ideas, if not *the* central idea is so effectively (though unintentionally) concealed as to be passed over easily. Henry Hart, in his painstaking and imaginative examination of the possible avenues to development for the village societies of the Indian subcontinent, comes up against the inevitable conflict between the peasant society and culture at the village level on the one hand, and the development administrators and higher governmental officials on the other hand. Noting that this problem is generally looked at from the perspective of the center, he nevertheless suggests that we reverse the procedure and take "... a perspective which puts the village in the center and the government on the periphery..." (p. 75). (For a recent work on the center-periphery issue in developing countries see Richard Stryker's essays "A Local Perspective on Development Strategy in the Ivory Coast," in *The State of the Nations: Constraints on Development in Independent Africa*, ed. Michael F. Lofchie [Berkeley: University of California Press, 1971], pp. 119–139; and "Political and Administrative Linkage in the Ivory Coast," in *Ghana and the Ivory Coast*:

Perspectives on Modernization, ed. Philip Foster and Aristide R. Zolberg [Chicago: University of Chicago Press, 1971], pp. 73-102.) Is that not what he ought to have been doing all along? It is not the automatic assumption that the developed world is at the center and the underdeveloped world at the periphery that has led to so much failure in aid activities and development administration? Have the agonies of the Soviet regime not been due to the manner in which Moscow and the CPSU have seen themselves as the center and everything else as the periphery? Would this reverse perspective not have illuminated effectively the problem of the flow of high-level human resources? Is the customary center-periphery perspective not responsible for the failure to conceptualize U.S. development as anything but a centralizing dynamic, with Washington and the big corporations as the center and everything else as the periphery?

It would indeed, have been more gratifying and more useful if the members of the Pittsburgh seminar had been able to develop more self-consciously the true central themes of their common effort. But taking their work as a whole, we are enriched by their reporting, their theoretical formulations, and their insights. Perhaps others have better ground for the judgment that "... any regime in the Third World would, alas, be better off with the paperback *Handbook of Public Administration* of the United Nations than with a cordovan-bound set of the Duke CAG papers" (Warren F. Ilchman, "Comparative Public Administration and 'Conventional Wisdom,'" *Sage Professional Papers in Comparative Politics* 01-02 [Beverly Hills, California, 1971], p. 44). I am not sure that CAG papers were ever meant to be briefing materials; but they might, in the long run, turn out to have better staying power than the U.N. handbook. They are not engaged in "selling" patented solutions; they merely suggest what might be worth having, given certain specified conditions. But it would surely have helped all of us if we had not had to wait until 1972 to see in print the work completed during the summer of 1965.

ALFRED DIAMANT

Indiana University, Bloomington

Czechoslovakia and the Absolute Monopoly of Power: A Study of Political Power in a Communist System. By Barbara Wolfe Jancar. (New York: Praeger Publishers, 1971. Pp. 331. \$17.50.)

Area specialists often hope that their research and findings will not only refine our un-

derstanding of their particular area but also contribute to the general theory and method of comparative politics. Their hope springs from a laudable scholarly ambition and from their painful discovery that a widely accepted model they had initially intended to use did not fit a particular set of national or international circumstances. Such a mixture of frustration and hope also characterizes Barbara Wolfe Jancar's carefully researched and well-documented study of the dramatic erosion and subsequent consolidation of authoritarian socialism in Czechoslovakia in the 1960s. In examining the nature and transformations of the communist system in small countries of East Europe, Professor Jancar seems to have found the Friedrich/Brzezinski comparative framework of totalitarianism wanting. Accordingly, she suggests a new framework and a new terminology.

Since totalitarianism implies *unqualified* control, the author suggests a new concept of "absolute power monopoly" which implies only (?) "*exclusive*, rather than total, control, by virtue of which no other groups or individuals can compete with the ruling group. Depending on the situation, the ruling group may choose to terrorize or liberalize" (p. 6). The author identifies eight monopolistic tools of absolute control which their parent source, the Party, manipulates as an octopus does its branches: (1) state power (which includes the police); (2) law and legislation; (3) nationalized economy; (4) ideology and culture; (5) mass communications; (6) education; (7) mass organizations; and (8) social security and medical care. It is doubtful that this new term will gain wide acceptance, despite some merits of Jancar's newly refined analysis which rightly stresses that no rule can really be total. One objection to the new term "absolute monopoly" is simply that it is redundant (can there be a "relative monopoly?"), and that *absolute* power monopoly is actually not more, but less qualified than totalitarianism. In fact, both terms give a somewhat ironic twist to a study that describes how very relative all eight absolute power monopolies may become unless they are protected against the corrosive acid of democratic pluralism by foreign intervention. In order to frighten the Czechs and the Slovaks back into an absolute power monopoly, the Soviet Union had to use 29 divisions, 7,500 tanks, and 1,000 planes.

The author's analysis of the forces that set out to liberalize Czechoslovakian communism from within reveals that they were either naively or boldly oblivious of the Soviet secu-

rity interests in the sensitive area west of Germany. However we may deplore the fact, the Soviet leaders rightly dreaded the contagious effects of the Czechoslovak "democratism" upon other East European Communist systems as well as the ultimate possibility that, in a true democracy, not only domestic but also foreign policy may be subject to discussion and revision. In the context of Soviet worries, the fall of Alexander Dubcek seems "irresistible" indeed—as was convincingly argued by Pavel Tigrid in his admirable study *La chute irrésistible de Dubcek* (Paris: Calmann-Levy, 1969).

As a country study, Jancar's book has many merits. The author's familiarity with the Czech and Slovak scene and its changes in the 1960s is evident. Most of her data have been collected in the field. Professor Jancar also displays a commendable sensitivity to Slovak nationalism and discontent directed at Prague centralism which had favored the Czech portion of the country for a very long time; while in 1968 the Czech intellectuals called for socialism with a human face (or, in Evzen Loeb's terms, "anthropocracy"), the Slovaks emphasized socialism with a human and a Slovak face. The result was a short-lived attempt at true Czecho-Slovak federalism.

This book also has some blemishes. The chapter on Czechoslovakia's history contains several debatable generalizations: the period of semi-federal Czechoslovakia between Munich (1938) and the Nazi occupation (March 15, 1939), for instance, seems to be telescoped into one event. As is often the case in volumes presenting area studies, many Czech and Slovak names are not adequately identified. On the other hand, this study merits serious attention because of its novel analysis of the intimate connection between the ups and downs of socialist economy and the cycles of liberalization and repression. Professor Jancar usefully challenges one wishful thought born in the Khrushchev era, namely, that "goulash" or "fat" communism (that is, a successful communist consumerism) would lead to political liberalization, if not to true socialist democracy. The Czechoslovak experience indicates that political liberalization, both promoted and circumscribed by the Party, resulted from a serious economic crisis and consumer discontent.

However depressing this may sound, the study also demonstrates how modern authoritarian socialism by the 1960s had perfected its controls over individual and group behavior: mass obedience and conformity are shown to result more effectively from the party monopoly over socialized economy and the access to

jobs and privileges than from terror à la Stalin or à la Hitler. In such a context, those who want to stay in their country and *live* tend to conclude that it is indeed better "to be red rather than dead," or, in more pragmatic terms, to be superficially red rather than to be deprived for the rest of their lives of better jobs, better salaries, weekend cottages (now prefabricated), cars, TV sets, or trips to a people's democratic sea resort. The all-permeating party control over jobs and privileges—and therefore over life itself—is based on a devastatingly simple assumption that among mortal men, on the whole, heroes and martyrs have always been less numerous than *bons vivants*—especially if they have to live in the proximity of the Soviet superpower. Jancar's study of the Prague Spring and the following Russian Winter is a valuable contribution to the growing field of comparative studies of communist systems; it is also an invitation to a further search for an analytical framework which would incorporate the penetrative radiation of a regional superpower into the inner-working of adjacent national systems.

The City College of New York

The Emergence of Black Politics in Senegal: The Struggle for Power in the Four Communes, 1900–1920. By G. Wesley Johnson, Jr. (Stanford: Stanford University Press, 1971. Pp. x, 260. \$8.75.)

With this study Mr. Johnson, professor of History at Stanford University, expands our knowledge of African politics and society in two directions. First, he adds most importantly to our understanding of pre-World War II "nationalist" movements, work comparable to that done by James Coleman in Nigeria, David Kimble in the Gold Coast, Carl Rosberg and John Nottingham in Kenya. Second, he contributes to the already impressive cross-disciplinary monograph literature on Senegal by Nigerians, Senegalese, French, and young American scholars dealing with the Islamic Brotherhoods, traditional social structure and caste, cooperative organizations, community development, pre-nineteenth century Wolof Kingdoms, Toucouleur conquerors, French assimilation policies, local government, etc.—a literature that cries out for synthesis and has added considerably to our knowledge of change in a "developing" country.

In the four "communes" of Senegal, France's oldest African holdings, Western politics first took root in the 18th century. By the time of the French Revolution, Saint Louis and Gorée

had African mayors, and in 1848 the four communes elected a deputy to the French National Assembly. By 1879 with the addition of a General Council (colonial assembly), Professor Johnson claims the four communes possessed "effective institutions of local government controlled by the urban inhabitants" (p. vii). But this system remained undemocratic for decades because the great majority of the electorate, the indigenous black Africans, was dominated by "a small clique of French and Creole politicians until 1900" (p. vii). How these urban black Africans obtained political rights before 1900 and expanded them by 1920 is the subject of Johnson's study.

After the turn of the century, a suddenly toughened colonial policy of retrenchment that sought to take away indigenous political rights at the very moment of growing African involvement, precipitated a complex struggle between colonial officials, French Colonialists, Creoles and indigenous Senegalese. Under the leadership of Blaise Diagne (the first black African elected a deputy to Paris), Africans won a series of elections replacing the French and Creole elite as arbiters of local politics. Johnson demonstrates particularly effectively how Blaise Diagne's victory represented more than an isolated or personal conquest. Diagne brought with him into office a host of Africans at the local and municipal levels. His advent into the French National Assembly marked the coming into power of a local indigenous establishment that thenceforth dominated Senegalese politics. In describing this process Johnson fills a gap left by French and African scholars. He pushes the advent of black politics back several decades prior to 1945, "the generally accepted date for the beginning of African nationalistic movements" (p. viii). After highlighting and documenting the significance of this first African political awakening in 1900-1920, the author goes on to suggest that nationalism, however, was not necessarily the key factor in Senegal's political history and that other factors, such as "assimilation, urbanism, elitism, and religion" were equally important.

Mr. Johnson does not feel himself bound by the conventional categories of political scientists and Africanists, having thought of this study as a political history, rather than as an investigation into nationalism or Senegalese resistance to the French. By thus refusing to bring predetermined conclusions into this analytic apparatus, Mr. Johnson hopes to have the facts better speak for themselves. In this effort he succeeds partially. He would judge early Senegalese leaders in terms of the times, not the

standards of the 1970s, and finds these leaders "effective, audacious and ambitious" (p. ix). Johnson's clarity in exposition is impressive—whether it be a capsule history of Senegal as essential background or a description of the "traite" (the peanut trade involving multiple middlemen and complicated credit arrangements). His scholarship rests on an admirable perusal of the records in the archives of Senegal and the French Ministry of colonies as well as painstakingly collected interviews with Senegalese personalities and their descendants.

Johnson promises a second volume on the consolidation of African politics from 1920 to 1945. Possibly as a result, one major gap in this study is a curiously incomplete portrait of Diagne (especially Diagne's speeches in the French National Assembly) and hence of politics during this period. There is almost nothing of Diagne's counterplay with Garvey or Du Bois; little about his becoming a spokesman for the Bordeaux commercial interests that, Johnson points out, ran Senegal; and only a hint of Diagne's becoming an apologist for colonialism to the extent of an incredible defense of forced labor—shocking even in the context of the times.

Johnson also does not dwell on Diagne's connections with the traditional and religious leaders. From his statement that it isn't his *purpose* to establish a direct link between traditional politics and the politics of the communes, Johnson goes on to assert that "it is doubtful that traditional politics provided an adequate training ground for urban politics: traditional political roles were ascribed, whereas those of the urban area were achieved by personal merit" (p. 7). This conclusion is not based on a factual assessment but on a logical inference using Western "ideal type" constructs. Traditional rulers of the great caste-based Western Sudanic Empires always knew how to use men of ability. If instead of hypothesizing two distinct types of society we pictured a single society with a variety of competing and interacting interests, we might be led to ask different questions and come to different conclusions. For example, Johnson mentions only briefly that the leaders of the Mouride brotherhood donated funds and made possible much of Diagne's campaign for election, and that the first people Diagne visited on arrival in Senegal were Lebou elders. In fact, was not Diagne the traditional leaders' French connection?

What Johnson describes as resistance by the urban political elite to French administrative domination and economic exploitation by Bordeaux commerce and the Creole oligarchy may

also be viewed in historical perspective as the beginning of a "new class" of black bourgeoisie. The spread of political action into the countryside may also be viewed as incorporating the elite of provincial cities and traditional notables by this black bourgeoisie—not the advent of mass politics.

In this respect Johnson's study provides essential background for an understanding of contemporary Senegal, where independence did not come as a result of actual or threatened mass struggle and where politics is still essentially an elite affair.

IRVING LEONARD MARKOVITZ

Queens College, The City University of New York

The Behavioral Revolution and Communist Studies. Edited by Roger E. Kanet. (New York: The Free Press, 1971. Pp. 376. \$9.95.)

In *The Behavioral Revolution and Communist Studies* Roger Kanet has placed under a single cover thirteen papers on Communist political elites, policy implementation and bureaucracy, and Soviet foreign policy which illustrate some of the steps that area specialists on Communist systems are taking to relate their research to that of their colleagues in the empirical social sciences. These steps stress the need to make research on Communist systems genuinely comparative by adapting and applying approaches, concepts, and techniques of analysis derived from research on non-Communist systems. The articles may be grouped into two categories: quantitative analyses and middle-range theorizing.

The quantitative analyses in the section on political elites include a study by Michael Gehlen and Michael McBride who have generated data on a number of background variables of members and candidate members of the CPSU Central Committee (*APSR*, 62 [1968], 1232–1247). Gehlen and McBride have constructed frequency distributions of the variables and employed a correlation matrix to determine patterns of interrelationships between pairs of variables. In the only article which employs East European data, Carl Beck, Gerard Johnson, and Thomas McKechnie examine changes in the composition of the Central Committee of the Bulgarian Communist Party at the time of the eighth Party Congress in November, 1962. They explore differences among those who were recruited, dismissed, and held over in terms of their careers within the Communist party by presenting statistics on discrete party positions and then using factor

analysis to locate systematic relationships among positions. The final quantitative piece in the section on elites is a study by Milton Lodge (*APSR*, 62 [1968], 827–839), who does content analyses of representative periodicals from 1952–1966 for five Soviet elites to determine trends in elite participatory attitudes in the post-Stalin period.

The findings of these three articles are of dubious value because of the authors' failure to deal successfully with a number of obstacles encountered when quantitative techniques are applied to the analysis of Communist systems. Because of the nature of the data available, assumptions are made which seriously distort reality (for example, Lodge's assumption of the group consciousness and solidarity of Soviet elites). Often the significance of the hypotheses tested is not dealt with adequately (for example, Gehlen and McBride's hypothesis that candidate members of the Central Committee are co-opted to provide a communications input into higher decision-making centers of the CPSU).

Another major obstacle to the application of quantitative techniques to Communist studies is pointed out in the conceptually oriented contribution of Joel Schwartz and William Keech (an expanded version of their earlier article which appeared in the *APSR*, 62 (1968), 840–851). On the basis of a case study of Khrushchev's educational reform of 1958, Schwartz and Keech conclude that "if one quantifies the number of articles which appeared during the debate, the oppositional point of view is clearly a minority. It is quite possible that a 'war of memoranda' may have been raging behind the scenes and that during this exchange the minority position was in fact the majority point of view" (p. 160).

A second conceptually oriented article in the section of elites is an attempt by Rita Mae Kelly and Frederic J. Fleron, Jr. to develop an approach to the long-standing question of the relationship between the official ideology and the actions and decisions of political leaders in Communist systems, by placing the question in the broader context of the motivational role of ideology (*Soviet Studies*, 21 [1970], 297–313). In another attempt to develop conceptual tools for the analysis of Communist systems which have cross-national significance Fleron sets up a classification of leadership systems and applies it to the Soviet Union (*Polity*, 2 [1969], 176–201). He hypothesizes that the co-optation process has been used by the political elite as an organizational response to legitimize its rule by providing a mechanism

for articulation and aggregation of various interests and by bringing capable, talented individuals into the political elite.

The three essays in the section on policy implementation and bureaucracy are attempts to adapt organizational theory, role theory, and development theory to Communist (and, in one case, Russian) studies. Each of these studies is concerned less with presenting substantive findings than it is with showing how a particular set of middle-range concepts can be adapted and applied to the study of Communist systems. Don Karl Rowney provides a research design for the study of the Ministry of Internal Affairs from 1904 to 1916 by drawing on the theoretical formulations of structural-functional analysis of formal organizations. Erik Hoffman's contribution shows how concepts developed in role theory can be used to study and understand the nature of role conflict and ambiguity in Soviet administration under Khrushchev; the regime's attempts to reduce role conflict and ambiguity under Brezhnev and Kosygin; and the way the regime has used the central press as an instrument for communicating role expectations to various audiences. Robert Sharlet focuses on the question of the role of law in political development. Using examples of Soviet economic, criminal, and family law, Sharlet demonstrates the proposition that various types of Soviet law can be viewed as performing a number of functions at different stages of development. On the basis of his overview he suggests a number of regulative hypotheses which can be used to orient research and narrow-gauge predictive hypotheses which can be operationalized and verified.

All the conceptually oriented studies lay the basis for potential contributions to Communist studies and help to bridge the gap between area specialists and political scientists by generating empirically verifiable hypotheses about the nature and operation of Communist systems derived from middle-range theory which has built upon the Western experience. An assessment of their actual contribution must await the time when the hypotheses are tested more fully against empirical data.

The final section of the book consists of three attempts to apply quantitative techniques of analysis to the study of the Soviet Union in the international arena. Charles Gati employs content analysis and correlation analysis of the foreign news items in *Pravda* and *Izvestiia* in order to ascertain "the relative weight the Soviet foreign policy elite assigns to various geographic regions or sub-systems of the world" (p. 282). P. Terrence Hopmann employs a

model of group processes derived from social psychology and communications and uses techniques of computer content analysis to measure the degree of cohesion within the Communist system during four major events of the postwar period. Finally, Dan C. Heldman presents a tentative and exploratory study of Soviet-African (developing nation) interaction with the aid of input-output models and correlation analysis. The utility of these three papers is placed in question because of their failure to generate relevant hypotheses and because of the glaring misuse of statistical analysis (for example, Gati's use of correlation analysis to determine "statistical causality" and Hopmann's measuring of intrasystem cohesion according to Communist states' perceptions of the West on the basis of content analysis of English language translations of single documents for each nation).

It is disappointing that the editor does not himself draw any conclusions about the potential contribution or obstacles in the use of behavioral approaches and techniques on the basis of the material he has chosen to include. In his introductory essay and in his introductions to each major section of the book, Professor Kanet does not indicate his criteria for selecting material, nor does he attempt to assess the utility or point to the pitfalls of the approaches and techniques used. He fails to suggest which are most appropriate in light of the data and types of political system under examination. And he fails to make any proposals about how the methods and concepts presented can be better adapted to the study of Communist political systems.

This failure of the editor to deal with his subject matter critically is partially compensated by Paul Shoup's introductory essay (*APSR*, 62 [1968], 185-204). The thrust of Shoup's argument is that there is no *a priori* reason why many comparative approaches cannot be applied successfully to Communist systems. However, on the basis of a survey of the literature on comparative Communism, he comes to two very sensible conclusions about the limits of behavioralism in Communist studies—limits which I find reflected in the contributions to this book. Regarding methodology, he suggests as a guideline for research that we focus our efforts on middle-range comparative studies at the subsystem level. Second, regarding methods of analysis, he concludes that "the field of comparative Communist studies is not yet in a position to become a quantitative discipline, in the sense that hypotheses will be routinely generated and then confirmed by meth-

ods of statistical probability, rank ordering, or other counting techniques" (p. 29).

Unfortunately, many of the contributors to this volume, especially those who have employed quantitative techniques, have not heeded Shoup's advice. One is left with the impression after reading most of the articles that very little has yet been added to our knowledge of the Soviet political system by applying "behavioral" techniques.

DONALD V. SCHWARTZ

University of Toronto

Conflict in the Congo. By Thomas Kanza. (Baltimore: Penguin Books, 1972. Pp. 346. \$3.25.)

It seems scarcely credible that a mere two decades ago the author of this intriguing *témoignage* of the 1960 Zaire (then Congo) crisis created a small crisis of his own by seeking to attend a university in Belgium—the first publicized application. That such a banal event could have become a cause célèbre tells us much about why independence became a global trauma a few years later.

Thus set apart by destiny, Kanza has been at once deeply involved in the turbulent politics of his country, yet also strangely apart from them. Except for brief periods—the longest being a frustrating and unsuccessful year in 1957 following completion of his university degree at Louvain—he has lived outside his native land, in Belgium until 1960, mainly in London since that time. As a quondam ambassador of both official and dissident regimes, he has sat in the councils of world diplomacy, and came to know personally many of the key actors in global politics. Unlike most of his contemporaries, he never entered politics directly; he sought no elected office in 1960, and did not acquire a domestic power base in Zaire, although he was widely known among the new elite. His own assessment of his place in the Zaire firmament is poignant:

My fight against Belgian colonialism had been a subtle, bitter, and merciless torture. Since 1952 I had been completely alone, and understood by none of my compatriots. . . . This sense of isolation and solitude was something I continued to feel even after independence . . . I had no choice. Would I ever have? (p. 93).

The book unravels the tangled skein of Zaire's political history from the 1958 Brussels World Fair, which provided the first occasion for a large number of Zairians to visit Belgium, and the death of Patrice Lumumba in January 1961. It is a very personal account; autobiography blends with analysis. Yet it is much more

than just another *apologia pro vita sua*; Kanza was at once deeply involved, yet curiously detached. He is sufficiently Zairian to perceive the crisis of independence from within, yet far enough into the international diplomatic network to fully seize the image of the crisis as seen from overseas. He was dedicated to Lumumba, or more precisely to "Lumumbism"—the vision of Zaire as a strong, united nation totally in control of its own political, economic, and cultural destiny; yet he was painfully aware that Lumumba did not fully trust him, and gives us a candid assessment of the flawed aspects of his character, as well as what Kanza sees as his outstanding virtues.

The coals of the 1960 crisis have been so vigorously raked over by so many hands that it seems implausible that anything of note remained to be said. Not so; Kanza illuminates many events, and offers sensitive and informative vignettes of the main actors. In the fluidity of 1960, some of the personal relationships between key figures were quite pivotal—perhaps none more so than the incompatibility of Lumumba and Dag Hammarskjöld, which destroyed both men.

Kanza offers valuable detail on the tortuous dealings leading to the establishment of the Lumumba government in June 1960. To cite but one example, Lumumba's simultaneous promises of support for the presidency to Joseph Kasavubu and Jean Bolikango are elaborated in revealing fashion. Reneging on the Bolikango commitment created a bitter and costly enemy for Lumumba.

Lumumba emerges as a man wholly obsessed with the struggle against imperialism, affected by a prescient vision that he might not last long, failing to appreciate the fragility of his jerry-built government. Kanza captures the essence of the drama of independence in a single sentence: "Though we sat so comfortably in our sumptuous official cars, driven by uniformed military chauffeurs, and looked as though we were ruling this large and beautiful country, we were in fact ruling nothing and a prey to whatever might happen" (p. 151).

For this very reason, international participants soon assumed a key role; Kanza is deft at identifying the external linkages of many leading figures. Communist cultivation of Zaire nationalists, he argues, was less intense than was generally believed. In Kanza's words, the Soviets sought out a few whose nationalism was anticapitalist and above all anti-American.

But when it came to financial aid, they were not very generous; they were quite willing to abandon financial corruption for the corruption of minds.

The few Congolese in whom they were interested were paid; but the payments were chicken feed, except to one or two—and these only got more as a result of fierce bargaining. The Belgian communist party acted as a liaison between the communist world and the Congolese nationalists; this was a grave mistake on our part, for the Belgian communist party was larded with double agents . . . (p. 141).

There are, of course, debatable points and noteworthy omissions in Kanza's account. For perhaps understandable reasons, he is careful to avoid critical commentary on Mobutu's role in the 1960 crisis. The animosity between the entire Kanza family and Kasavubu is a well-known theme of Zairian politics; this animus is apparent in the very negative assessment of the first president. Kanza clearly exaggerates the capacity of the national army to have carried through its abortive invasion of Katanga in August 1960; he is inexplicably silent on the atrocious massacres of Baluba civil populations when this disorderly force was unleashed in hostile territory, an event which Hammarskjöld emotionally stigmatized as "genocide," and one of the several immediate precipitants of the September coup. And Kanza's own analysis of Lumumba's increasingly erratic and impulsive responses to a deteriorating situation in August 1960, demonstrates why the author's efforts at the time to persuade Western powers and the UN Secretariat to have confidence in Lumumba's leadership were doomed to failure.

Just possibly the course of history in Zaire might have been different had Lumumba taken greater advantage of the wisdom, prudence, and insight of this faithful follower, who fully shared his vision of the future. As it is, Kanza adds an important contribution to the historical record of the crisis of independence in Zaire.

M. CRAWFORD YOUNG

University of Wisconsin, Madison

The Emancipation of the Polish Peasantry. By Stefan Kieniewicz. (Chicago: University of Chicago Press, 1969. Pp. 285. \$11.75.)

Here one of Poland's most distinguished historians of the nineteenth century in the Polish lands has undertaken a narrative account of one of the century's most critical issues. The book is an elaboration of lectures Kieniewicz delivered at Chicago in 1968, written in response to the intelligent encouragement of his colleagues and the university press. It constitutes the most adequate treatment of this particular complex of peasant emancipation processes now available in any language. As such it could serve almost as an advertisement for

the value of East-West cultural exchange.

Because their task is to construct narrative, historians face special difficulties, even when they deal with single issues. The history of these lands renders the difficulties all but insuperable. Northeast Central Europe was and is a region of great ethnic diversity, and between 1795 and 1918 these peoples, at disparate levels of social and economic development and national consciousness, were under the disparate sovereignties of Romanov, Hohenzollern, and Habsburg. The subject matter is thus exceedingly complex.

Kieniewicz has sought to do scrupulous justice both to this complexity and to the inadequacies of the very substantial data on peasant emancipation developed over the past generation by Polish research. There is synthetic treatment of the beginning (the Enlightenment period in Old Poland), the progress of agriculture and democratic propaganda (in the first half of the nineteenth century), and the end (the agrarian problem which faced New Poland in 1918), and there are comparisons throughout. Nonetheless, most chapters deal only with one sovereignty. In Old Poland, despite considerable variety in situation according to quality of soil, distance from markets, and even legal status, most peasants had been personally unfree and tenants at will. In general, emancipation began with the grant of personal freedom, continued with the strengthening of tenancy rights, and ended with the grant of freehold. But this process took different forms, had different timing, and followed different political imperatives in each sovereignty. At each stage, in other words, the particular mix of pressure from above (reforming landowners and harassed governments) and pressure from below (actual or potential peasant revolts) was unique.

The results were also unique. At the conclusion of reforms marked at start and finish by revolts, almost all peasants in Austrian Poland had land, but too little, and peasant life there was characterized by poverty, parceling, wild land speculation, and emigration. The more gradual Prussian reform created a substantial yeomanry alongside the large estates, at the cost of driving many peasants off the land into industry. The Russian reform, also gradual but punctuated more by upheaval like the Austrian, kept the peasantry on the land like the Austrian but in better conditions, since the state supervised land parceling and had less interest than the Austrian state in conciliating Polish nobles. Further distinctions among the three partition zones involved state and private estates, forest and common field rights, landholders and landless, compensation arrangements, rights to dis-

till and sell alcohol, local and central political prerogatives, and scope for peasant political action. The impression is almost inescapable that the historic task of the New Poland established in 1918 has been nation building.

Conceptually, there are only a few ways of imposing unity of vision on so much diversity. Polish historiography has traditionally concentrated on the struggle to recover state sovereignty. Kieniewicz has chosen to focus his narrative elsewhere, on peasant emancipation. Even here, however, one must choose.

The most comparable English-language work, Jerome Blum's *Noble Landowners and Agriculture in Austria 1815-1848* (Baltimore, 1948), managed the problem of political multiplicity by dealing with only one monarchy and the problem of ethnic diversity by framing the analysis in terms of class struggle, seen monarchy-wide. Blum concluded that "the landowners" had espoused emancipation for efficiency and profit and for fear of peasant revolt, but on terms advantageous to them, and that this "program" had been adopted in 1848. Postwar Polish research has analyzed new mountains of data and emphasized pressure from below, but it has commonly achieved narrative coherence by the same method: omitting non-Polish populations, engaging in class struggle, and confining analysis to one partition.

Kieniewicz has adopted some of these practices, notably by defining away non-Poles in his terms of reference and by extensive use of the class struggle concept. But because he wishes to describe the emancipation of Polish peasants everywhere, he must find a concept which comprehends them all, whatever the actual disparities in experience, situation, and national consciousness. This can only be the concept of potential Polish nationality. And in fact the theme of the book is that peasant emancipation was the necessary precursor of national liberation because it was the essential precondition to the growth of Polish national consciousness among the peasant majority. In this way the concept of Polish nationality is at once the cause of this narrative's unevenness and the cornerstone of its unity, and Kieniewicz rejoins the mainstream of Polish historiography.

The book will be of interest not only to students of Polish history in general but to political scientists concerned with developing societies, for the relation of social change and national consciousness in backward (and nonself-governing) polities is as topical in most of the world today as it was in East Europe a century ago.

Communism in Japan: A Case of Political Naturalization. By Paul F. Langer. Hoover Institution Studies 30. (Stanford: Hoover Institution Press, 1972. Pp. 112. \$5.95.)

Hadaka no Nihon Kyōsantō [The Japanese Communist Party Bared]. By Kōtarō Tawara. (Tokyo: Nisshin Hōdō Shuppanbu, 1972. Pp. 330. ¥550.)

The survival and growth of an organization depends both on the nature of its environment and on its own ability to adapt creatively to that environment. This is the implicit thesis of a concise, though broadly focused, study of the Japanese Communist Party (JCP) by Paul Langer, one of the foremost specialists on the subject, based at the RAND Corporation. Now in its fiftieth year, the party came into existence as an illegal organization because of the lack of freedom in prewar Japan and was only liberated from that status by Japan's defeat in 1945. In the mid-1920s, however, it did play a more important role in the labor, agrarian, and proletarian party movements than Langer gives it credit for. But by 1935 severe state repression and rising ultranationalism had almost completely obliterated it. It revived and grew rapidly during the first five years of the American occupation until the Korean War, when the occupation officials severely crippled it, and it responded with some attempt at guerrilla tactics. Since 1955 it has gradually readapted itself to the parliamentary path to power internally and to independence from external interference by the powerful ruling parties of the Soviet Union and China. This process of "naturalization" (p. 97), according to Langer, has assured it a place as "part of the Japanese political scene" (p. 36).

That the JCP no longer poses a "security" but rather a "political" question (Tawara, p. 2) is the basis for the longer, more journalistic but nonetheless competent book by Tawara Kōtarō, a free lance commentator and former editorial writer for the *Sankei* newspaper. The first of the four parts into which Tawara's book is divided attempts an "objective" survey of the party at present; the second, a more subjective evaluation of the prospects of the party's goal of a "democratic coalition government" (seen as slim for the next decade or two); the third, a detailed account of the JCP's relations with the Chinese, and, by way of contrast, the Russian Communists (decisively bound up with the rise of the present JCP Secretary General Miyamoto Kenji, who had not been abroad or beholden to them before the war); and the last, an analysis of Miyamoto's extraordinary control over the party apparatus through mobilizing older factions and through expulsions (the

most interesting section). Tawara's book is less integrated than Langer's, which moves logically from pre- to postwar, and from the party's national to its international environment. Also, Tawara's volume does not contain even the minuscule bibliography and chronology, or the name index and minimum footnotes that Langer's does, though it has an ample and convenient table of contents.

Tawara's book does, however, provide an interesting supplement to Langer's for those who read Japanese. Not only does Tawara include more detailed and slightly newer material (to March 1972) but also he sheds light on perhaps the one important weakness in Langer's analysis, namely, Langer's neglect of why, except for his vague "naturalization" thesis, the JCP is today the "largest non-ruling Communist party outside Western Europe" (Langer, p. 16) with a membership of some 300,000—far outstripping any other opposition party in Japan. The Buddhist-inspired Kōmeitō has less than half the membership of the JCP, and the Socialists (JSP) and the Democratic Socialists (DSP) each have only about one-tenth. Of course, election votes are not proportional to party size. Tawara attributes the large JCP membership mostly to the managerial abilities of Miyamoto who does not run for the Diet but concentrates on party building. Through a cluster of "new young bureaucrats," he directs a vast organization and publishing operation. The Sunday *Akahata* has reached mass proportions (more than one and one-half million readers). Another reason the party has grown is that it provides an active party life and creates a "community" (Tawara, pp. 205 ff.) for the people left behind in the economic dash or alienated by the emphasis on "materialistic" values as well as by the waste, pollution, and indifference of the "affluent society." Consequently, outside of the violence-prone radical "New Left," the JCP retains the greatest appeal for youth as seen in the composition of party membership (Langer, p. 28). It also successfully appeals to women, whose voting rate is higher than men's.

From reading neither of the books, however, would one anticipate the remarkable JCP achievements of the December 10, 1972, House of Representatives elections in which the party executed a "great leap forward" from 14 to 38 (plus 2 pro-JCP) seats and capturing 11 per cent of the vote. This catapulted it over the Kōmeitō and DSP to become the second largest opposition in the Lower House. Both authors agree, however, that the independence from the Chinese and Soviet parties is an aid to wider acceptance in Japan. They also conclude that

the JCP has an edge over the JSP in appealing to Japanese nationalism in that the JCP designates the main enemy of the Japanese people as the *foreign* "imperialism" of the United States, whereas the JSP considers the villain as *domestic*, Japan's own "monopoly capitalism." Langer appears more sanguine about the conservative government's ability to solve internal social and economic questions (p. 95). Both consider the leadership skills of the other opposition parties extremely important in determining the JCP's future growth, since at present it appears that it would be mainly at their expense (Tawara, p. 166; Langer, p. 97). The JCP's great hope, then, in the next two decades actually lies in its becoming the main spokesman for the opposition to the conservative ruling party or coalition. Tawara convincingly argues that this will be an increasingly responsible opposition, however, operating within the context of the democratic system and yet mobilizing the people at the grass-roots level (Tawara, pp. 324–27). Despite its lack of sufficient explanation for JCP successes, Langer's well-rounded survey will be welcomed by the comparative government specialists for personal updating and for classroom use. The area specialists with Japanese language competence will find that Tawara's popularized account complements Langer's in providing background color, personalized sketches, and more speculation on the Japanese Communists' future.

GEORGE O. TOTTEN, III

University of Southern California

Social Conservatism and the Middle Classes in Germany, 1914–1933. By Herman Lebovics. Princeton: Princeton University Press, 1969. Pp. 248. \$8.50.)

The fourteen years of the Weimar Republic exposed the Germans and in particular their middle class to three severe social, economic and psychological adjustments: first, the military defeat after four years of illusion about a victorious peace; second the "rationalization" of the economy plus the experience of inflation; and finally, the collapse of the political system which destroyed the emotional and social security the non-socialist groups had enjoyed under the monarchy. This, coupled with the impact of the anti-western trend of the war propaganda, led among the bourgeois intelligentsia to a general anti-democratic and pseudo-philosophical grouping, generally known under the label of Conservative Revolution or National Bolshevism.

Many scholarly books have been written on the groups that identified themselves with this trend, including *Linke Leute von Rechts* by

Otto-Ernst Schüddekopf, *Antidemokratisches Denken in der Weimarer Republik* by Kurt Sontheimer, *Germany's New Conservatism* by Klemens von Klemperer, *Oswald Spengler* by H. Stuart Hughes, and one wonders why they did not receive more credit in this volume. Granted that Lebovics purposely restricted his topic to the problems of the middle class and the economic and sociopolitical views propounded by Werner Sombart, Edgar Salin, Othmar Spann, Oswald Spengler, Ernst Niekisch, and Ferdinand Fried. Since their ideas, however overlapped with the other psychological problems mentioned above, one cannot really separate them from each other, and Lebovics, in fact, does not do this either. When discussing the ideology of those men, he is going far beyond his stated topic, the plight of the middle class and the suggested solutions to their problems.

Werner Sombart, called "the Red professor" in his youth, was converted by World War I and then discovered what he called "German Socialism" in contrast to the proletarian socialism of Karl Marx. Spengler saw salvation in "Prussian socialism," defining it as a return to the barracks of Prussia and good Prussian virtues such as "authoritarianism," "obedience," "discipline" and "self-sacrifice." Edgar Salin is less easy to identify because, under the spell of the poet Stefan George, he tried nothing less than to attempt to institutionalize George's "the beautiful life." The Viennese Othmar Spann possibly came the closest to reality with his (not very original) concept of "corporatism," as opposed to parliamentarism, but being a professor, he also tried to develop a theory which entailed what Lebovics wittily called "*packln* turned into metaphysics," *packln*—an Austrian term—being loosely translated by Lebovics as "wheeling and dealing." Ernst Niekisch looked toward "National Bolshevism" and "the East" for salvation, being full of contempt for Stresemann's efforts to smooth things over at Locarno. Finally, Ferdinand Fried and the *Tatkreis* tried to create a "Third Front," which would offer an alternative to democratic socialism on the one hand, and the vulgar nationalism of the Nazis on the other.

There appears little need to further discuss their ideologies. What is striking about this group is that they included many gifted men, and this may explain the fascination this topic has, and why it keeps attracting young scholars again and again, though one might hope that this chapter can now be closed. Dependencies

with regard to National Socialism is not a worthwhile approach to the problem of explaining the latter. I also believe that one does those "thinkers" and their literature too much honor to put so much solid and profound scholarship into the effort to make sense out of something that was partially, at least, nonsensical. In connection with this, one wonders therefore, why Zehrer, the editor of *Die Tat*, and Fried were "compelled" to leave the university (p. 182). Was it purely for economic reasons, or were they rebels who felt no need to subject themselves to the rigid discipline and the hardships of academic life because of their "intellectual superiority" over university professors? Having personally known some of them, I feel inclined to suspect the latter. There was a great deal of arrogance surrounding this group, who were neither able to adjust to life and its normal requirements nor to ordinary language, creating their own terms and giving them an exclusive "German" meaning. There was genuine idealism in them, but on the whole they were "aristocrats of the mind," "elitists" as well as political romanticists and thus very far removed from the mentality and the life of the middle classes and their immediate needs. This dichotomy between theory and practice is also evident in Lebovics's volume and the book falls somewhat apart between the introductory and concluding chapters, in which he discusses the plight of the middle classes, and the heart of the book in which he is analyzing the various theories. The question here arises: Who were the people who read the books and pamphlets of these men? Certainly *not* the white collar workers, the shopkeepers and the peasants who constituted the middle class in Weimar Germany. One may assume therefore that they wrote for their own self satisfaction and that they were their best subscribers to their "new" ideology.

Lebovics's book is well written, and one is grateful that he has condensed the basic theories of these people, while at the same time providing enough quotations to give the reader an accurate impression of them. I do not agree, however, with his emphasis on the "failures" of the Weimar politicians which have so often been repeated (and which certainly did exist) while neglecting the problems which the politicians had to deal with; above all, by neglecting the antidemocratic trend of that period, Lebovics unconsciously appears to prove correct those who called for a "savior" or great man. But in a democracy, one has to deal with ordinary people, and not with charismatic

leaders; in this sense, a leader such as Stresemann achieved much, as even Hitler later admitted. To Niekisch, however, this was not enough. For him, "humanity" and "internationalism" were embraced only by those Germans who lacked true "Germanness." In his view, a true German nationalist would "smash the whole world to pieces rather than be guilty of an act of disloyalty to his own German self" (p. 150), whatever this was supposed to mean.

Though it is considered to be the historian's task mainly to understand and to analyze, I feel that the people Mr. Lebovics is dealing with require more criticism than understanding because they belong to that category of academicians of whom Hans Heigert says "that for more than 150 years they failed to do what would have been their profession to do: to think rationally and logically, use human reason as judgment, and look with critical reason towards the future."

ANNELISE THIMME

University of Alberta

The Politics of Culture. Edited by Antonín J. Liehm. Translated by Peter Kussi, with an introduction by Jean-Paul Sartre. (New York: Grove Press, Inc., 1972. Pp. 412. \$10.00.)

With the benefit of hindsight, Liehm's anthology of interviews with Czech writers, during 1967 and 1968, appears in a different perspective, as if the "most cruel goddess of history" (Engels) would like to use its irony not only on the silenced Czech intellectuals but on the two comments by Liehm and Sartre as well. Further, a very different and more balanced view of Czech culture might have been presented with another selection of authors. *The Politics of Culture* presents 15 names of reformist Communist writers around the journal *Literární listy* (Laco Novomeský, Milan Kundera, Ludvík Vaculík, Jaroslav Putík, Dominik Tatarka, Eduard Goldstücker, Lumír Čivrný, Peter Karvaš, Ivan Klíma and Karel Kosík), with only four non-Communists (Jiří Mucha, Ester Krumbachová, Josef Škvorecký and Václav Havel). A second unwritten volume of *Politics of Culture* would have to include the equally or more important names of 11 ignored non-Communist intellectuals (such as Jaroslav Seifert, Jan Werich, Václav Černý, Vratislav Effenberger, Jiří Suchý, Jiří Kolář, Josef Hiršal, Valdimír Holan, Jindřich Chaloupecký, Jiří Němec and Jan Grossman) to which it would be a pleasure to add four orthodox Communists (for example Jan Drda, Ladislav Stoll,

Jan Procházka and Pavel Kohout) to show the real abysses between the two decisive orientations which Liehm tends to overlook. However, the anthology belongs among the most important source books about the Czech Spring '68, precisely because it reveals the authentic origins of the Czech catastrophe.

The Czech culture of the 'sixties, as reflected in Liehm's book, can be regarded as an integral part of the persistent, increasingly vigorous, and open protest against the repressive regimentation of art—a development which was inaugurated by a philosophical discussion (1956), by the so-called "poetry of everyday life," and later by J. Škvorecký's *The Cowards* and new literary criticism. It continued with the rebellion of abstractivists in the visual arts, in the experimental theatres, music and film, and culminated in the new novel, in television commentaries, and in an open revolt of the intellectuals against the cultural policy of the Communist party. The Czech culture of the 'sixties brushed aside the original antagonism between dogmatism and revisionism, and in its best works was represented by the non-Communists. A continuous flow of open protests increasingly involved broader strata of the general public. While the artists' associations as the transmission belts of the Central Committee of the Communist Party of Czechoslovakia were the principal centers of party policy, the artists as a social layer of the intelligentsia could no longer be tamed merely by the advantages ensuing from membership in the Association, trips abroad, and so-called literary loans as the transmission levers of corruption. The intellectuals were ready for a revolt.

When the revolt really came (1968), the fundamental differences within the Czech culture could not be openly stated, because they would have undermined the common course of action against the party control. The group around *Literární listy* (with Liehm as a leading spirit) and its exponents in the Association of Writers completely dominated the leadership of democratization campaigns in the area of cultural policy. Although most of them were reformist Communists, they suddenly, de facto and overnight, became the representatives of that non-Communist trend which in a small-scale cultural guerrilla war had defended the fundamental humanistic values and cultural freedom for more than ten years. This was a bizarre turn indeed. It may appear puzzling that it was the Communist intellectuals who became the foremost reformers without feeling the discrepancy between their former and

present attitudes, without questioning their own class consciousness, without realizing the transformation of their roles and the differences in the principles employed in 1948 and in 1968.

What conclusions can be drawn from Liehm's book?

(1) With due respect and occasional admiration for the works of Milan Kundera, Antonín Liehm, Jaroslav Putík, Ludvík Vaculík and other literary representatives of reformist communism, I believe that the Czech literature of the 'sixties did not reflect the idea of reformist communism, but a democratic opposition to the totalitarian dictatorship by independent groups. The true intellectual leaders—not mentioned by Liehm—were members of the non-Communist intelligentsia and were the most powerful personalities: Vratislav Effenberger in literary criticism; Václav Havel and Jan Werich in drama; Jiří Kolář, Jaroslav Seifert, Vladimír Holan in poetry; and Josef Škvorecký in the novel. Independent intellectuals (not the temporarily reforming Communists) made the Czech culture great in the 'sixties by promoting that organic growth of values which a totalitarian dictatorship always and everywhere hinders, no matter whether it happens to be momentarily conciliatory or aggressive.

(2) The cultural policy of "socialism with a human face" was romanticism of the Communist intellectuals which was incompatible with the real world of tank divisions. The employment of tank divisions against cultural works is not rational, but it is effective. Forms of political behavior must always be adequate to the subjects over whom the political influence is to be exercised. The Czechoslovak Communist intellectuals failed to give guidance at the decisive moment, and no matter how we appreciate their art production, the Prague Spring means their defeat. It also means that the tremendously growing social weight of the non-Communist intelligentsia and of the middle classes might give birth to political leaders in the future. Will they master the technology of politics at least to such an extent that they will not lose the decisive battle next time?

(3) Romanticism in politics is a sure way to defeat. Hölderlin, a romantic poet of the last century, once yearned for the banner under which he could shed his blood honorably, even in a hopeless battle like Thermopylae: "Ah, if I only had a banner . . . and Thermopylae where I could shed my blood honorably. . . ." The reformist communists from the literary clubs hoisted the banner, and the Soviet tanks pro-

vided Thermopylae. The blood that was shed, however, was not the blood of the reformists. Who are the romantics who are not willing to shed *their own* blood for their own illusions?

IVAN SVITÁK

California State University, Chico

Agrarian Reform and Peasant Revolution in Spain. Origins of the Civil War. By Edward E. Malefakis. (New Haven: Yale University Press, 1970. Pp. xxx, 469. \$15.00.)

Professor Malefakis's monograph, which won the American Historical Association's Adams Prize for the best book in European history, is essentially concerned with the reasons for the complete failure of the agrarian reform of the Second Spanish Republic, a failure which the author seeks primarily in politics. The book's first four chapters are dedicated to a detailed study of land tenure and social structure in rural Spain, especially in the southern latifundia regions. In the following ten chapters, the author studies the debates and political maneuvers which led to the passage of the agrarian reform bill, analyzes the legislation which was approved, and discusses the subsequent developments in the countryside and in the Cortes which prevented its implementation. In view of the ground-breaking character of this book, which is the first serious study of one of the most crucial problems in the modern history of Spain, it may be well to summarize some of its most important findings.

The author's introductory study of rural society lays to rest many venerable myths. He demonstrates, for example, that the existence of latifundia in Andalusia cannot be explained in purely geographic or economic terms but must be traced to historical patterns originating in the reconquest and resettlement of the land in the Middle Ages. Similarly he tells us that by the 1930s the Church owned less than one per cent of the land area of Spain and that noble holdings accounted for only about eight per cent of the cultivated land in the six key latifundia provinces and no more than six per cent in the country as a whole. This implied that, contrary to the belief of many contemporaries, no significant reform could be carried out by merely seizing the lands of the Church and the nobility without attacking the interests of other social groups. The author is to be especially commended for the combination of energy, ingenuity, and judgment which has enabled him to overcome the notorious deficiencies of Spanish statistical material and present in the early chapters a detailed, accurate picture without overstating the strength of his conclusions. This

part, which the author modestly describes as introductory, constitutes in itself a major contribution to our knowledge.

In the second part, the author presents an account of the Second Republic's efforts at land reform. The government formed by the Republican Action leader Manuel Azaña was supported by the Socialists and by a coalition of four Left Republican parties. Malefakis points out that Azaña and his supporters outside the Socialist party were essentially urban-oriented, with little understanding of or commitment to agrarian reform. A tiny Agrarian minority in the Cortes was consequently able to prevent the passage of any significant legislation for over a year, until the abortive Sanjurjo coup in August, 1932, finally galvanized the majority into action. The legislation which was approved in September, 1932 was poorly conceived. It unnecessarily affected many medium landowners, the author charges, largely because of the Socialists' insistence on extending it to the entire country rather than limiting its application to the latifundia provinces. Once the legislation was passed, the government lapsed again into inactivity. During the first year only 45,000 hectares changed hands to the benefit of a mere 6,000 or 7,000 peasants.

In September, 1933, when the breakup of the Left Republican-Socialist alliance led to new elections, the Right and Center emerged much strengthened. The Catholic CEDA party alone returned 110 deputies, more than the combined total of the Left, while the Radicals won close to 100 seats. The Center-Right governments which followed Azaña were even less committed than their predecessor to serious agrarian reform, and it is commonplace to charge them with the responsibility for its failure. Malefakis's account of their record certainly does not rehabilitate them, but it does show some patches of light—particularly the efforts of the CEDA Minister of Agriculture Jiménez Fernández—which relieve the panorama of black reaction.

More important, the author argues that the prospect of peaceful change in the Spanish countryside had already been lost by the time Azaña fell. During the first two years of the Republic the Socialists had followed a policy of moderation. Their progressive radicalization under the leadership of Largo Caballero was due, he tells us, to Azaña's failure to offer them concrete achievements in the area of agrarian reform. It meant, he believes, that an essential condition for nonrevolutionary agrarian reform had been lost, even if Azaña had retained power, and explains that "what might have

been the birth pangs of a new social order proved instead part of the death throes of the Republic" (p. 316).

The chief theoretical question raised by this book is the possibility of peaceful democratic agrarian reform. Although Malefakis does not discuss the point at any length, it seems clear to the reviewer that an *economically* successful reform that would have raised the standard of living significantly could not have been carried out in Spain by peaceful nor by revolutionary means until the country had achieved a higher degree of industrialization. As Stanley Payne has noted, Spain lacked in the 1930s the technical and financial resources necessary to improve greatly the lot of the peasants. (*World Politics*, 25 [October, 1972], p. 165).

On the *political* level, which is the main focus of the author's concern, the abundant evidence he presents suggests to this reviewer that the prospects for success were negligible. On this score there seems to be a certain unresolved tension in Malefakis's mind. The introduction and conclusions make it clear he is aware that the peasants' demands "fundamentally threatened the politically powerful large owners" (p. 6). The fact that the stakes for both landholders and peasants were too great to allow them to wait patiently suggests to him that "the Western model of peaceful, constitutional change is not feasible for large-scale land re-distribution" (p. 395), and that "the Republic would probably have failed even under the best leadership because the circumstances under which it functioned were so unpropitious and the problems it faced so complex" (p. 339).

Throughout the text, however, he lays stress on delays in drafting and applying the reform legislation (e.g., p. 249, 268, 283, 397) and on the tactical and personal failings of the Republican leaders (e.g., p. 252-253). This stress on the incidents of the political struggle tends to suggest to the reader that the author is convinced that had the persons who made up the government and the attitudes that influenced them been different, "the agrarian reform might have prospered and the progressive Republican regime might have established itself as the enduring form of government in Spain" (p. 399).

The complexity of this problem of counterfactual history suggests the need for further study of the conditions under which peaceful democratic land reform can take place, but in no way detracts from the merits of this excellent book. It is the best monograph on Spain in the 1930s and represents a highly significant

contribution to the literature on agrarian reform.

JOHN F. COVERDALE

Princeton University

Count Witte and the Tsarist Government in the 1905 Revolution. By Howard D. Mehlinger and John M. Thompson. (Indiana University Press, 1972. Pp. xiv, 434. \$17.50.)

Unlike the Soviet regime, the reign of the last tsar has been the subject of few first-rate analyses by Western scholars probing into the staggering tasks confronting the government. Until the present work we have not even had a study of the crisis of 1905-06 from the perspective of the man whom Nicholas II reluctantly chose to stave off a genuine revolution, Sergei Witte. Sponsor of the October Manifesto and Prime Minister of sorts for six months after its promulgation, he guided the tsarist regime from its threatened collapse at the time of the General Strike to its consolidation in the spring of 1906 under a new set of institutions and policies destined to see it through another decade. Dismissed before the meeting of the First Duma, he bequeathed the subsequent fulfillment—and the glory—of his work to Stolypin, a simpler and more likable personality, but obviously of lesser caliber.

This admirably thorough and well-documented study, illuminated occasionally by a cautious pursuit of might-have-beens, greatly advances our knowledge of the events in these months and of the basic issues before the tsarist regime: public participation in the governance of Russia, the form of its constitution, the conduct of elections, the rights of citizens; the peasant question; the loyalty of the army and the preservation of order; the financing of the state, and Russia's financial dependence on foreign countries. It also provides new insight into the crushing quandaries facing a statesman of unusual scope bent upon broadening the political base of the government while being forced to restore law and order in a vast, largely illiterate polity, rent by century-old tensions, and polarized beyond repair. Because of its realism, this study for the first time permits sound comparison between the pseudorevolution of 1905 and the real one of 1917, between the six months of the Witte regime and the eight months of the Provisional Government. In its largest perspectives, it invites comparison with similar troubles in other developing countries.

The key dilemma confronting Witte lay in the necessity of restoring order as a precondition for transforming the tsarist autocracy into

a regime based on law and allowing a controlled measure of public participation. Order meant repression, and repression forestalled the growth of consensus and legality in preparation for rallying public support. The condition of Russia at the time left no alternative: Stolypin soon proved the (limited and temporary) validity of a policy of order and reform combined. Yet in the half year after the General Strike, the inherent contradiction was obvious: Repression strengthened the reactionaries, and in turn prompted the continued radicalism of the opposition. The flaw rubbed off on Witte, who never succeeded in maintaining a clear course between his deeply ingrained loyalty to autocracy and his westernized, liberalizing vision; he meandered unpredictably between one and the other, to the dismay of his friends and the contemptuous delight of his enemies. Arrogant as a result of early success, he had even less chance than the much humbler Prince Lvov in 1917 to establish a political base of his own. Sociologically and psychologically oriented scholars might have made even more of the disorientation in the Russian polity and the mind of its leaders which was so essential an aspect of the Russian passage through the age of revolution. Is it not true of all revolutions that with the analytic tools available no one perceives the deeper meaning in the press of events?

A final delight in this book is the successful collaboration of the two authors. Each contributed, at the start, his own research interest; conjointly, they produced a seamless text of fine scholarly quality.

Clark University

Structural Change in a Developing Economy: Colombia's Problems and Prospects. By Richard R. Nelson, T. Paul Schultz, and Robert L. Slighton. (Princeton: Princeton University Press, 1971. Pp. 322. \$12.50.)

This book represents an interesting and unusual effort, based on background research of a team including economists and political scientists, to integrate economic and political aspects of the post-World War II development process in Colombia, with a clear attempt at relevance to a broader range of developing countries. While the framework is broad, specific focus is limited to three major themes: the relationship between economic development, rapid population growth, and internal migration; development as a process of structural change in a technologically dualistic economy; and policy making as a behavioral response by the govern-

ment to the shifting preferences of the governed.

The book is well written, clear, and interesting, and—more impressive—it pulls together into a rather well-integrated whole, discussions of what are inevitably only a subset of the relevant aspects of a growing economy. The analysis is solid, given the data and the analytical frameworks used. At a number of points, including the unconventional discussion of manufacturing development, it is important to interpret the book for what it is—an attempt to cut into the system from a few selected angles, for whatever new understanding this provides; there is no attempt to cover the waterfront. Given this, the only real weakness in the economic portion of the book lies in the data used; unfortunately, the ubiquitous statistical pitfalls of economic analysis in a country like Colombia sabotage some of the more interesting and central conclusions.

Among the basic contentions of the book, two deserve special comment:

(1) Growth (here the discussion focuses on manufacturing) is in considerable degree the result of technological diffusion, i.e., the spread of better ways of producing; in general, the modern firms which lead the way, technologically speaking, are the large ones. Growth proceeds as modern firms expand relative to traditional ones and some traditional firms become modern. This “structural transformation” framework for the discussion of internal growth is a refreshing variant from the usual one, where capital accumulation and automatic, generalized, technological change account for factor productivity increases. The study takes into account, as rather few have, the great heterogeneity of technologies in the production of a given good. As a description of what happens in the long run, this is clearly a useful approach, although the implication—sometimes strongly drawn—that modernity is almost assuredly beneficial is open to some question.

(2) “The introduction of a modern sector on top of the traditional craft sector, and the widening of the productivity gap between the two, present the potential for a growing inequality of the distribution of urban income” (p. 129). It is argued that the major beneficiaries of this change are likely to be the middle and lower-middle classes and that the income share of the lower half of the labor force will be reduced. The conclusion that “productivity growth in the large (greater than 100 employees) and medium size (50–100) firms tended to be significantly greater than in the small firms; indeed,

productivity in the smallest firms would appear to have declined over the period” (p. 126) has subsequently been shown probably to be incorrect, a result of quirks in the data used. And the conclusion (p. 142) that urban income distribution worsened between 1953 and 1965, based on information for Bogotá, is doubtful, because of a misinterpretation of the 1953 data; subsequent work by Miguel Urrutia and others has generally concluded that the distribution in question either improved or remained constant over this period. In short, the most recent data pertinent to this second contention lend it only limited support.

The focus on demographic issues distinguishes this book from most country analyses; in my view it is a healthy emphasis. The interesting contribution to the discussion of migration in Colombia (Chapter 3) reveals that interregional migration responds strongly to market forces, drawing rural labor to the cities from regions where the returns to labor are relatively low and the supply is growing relatively rapidly. It is argued that the wave of rural-urban migration has been heightened by the increase in the rate of population growth that followed improved sanitation, nutrition, and health practices after the 1940s.

The discussion of the functioning of a system in which the government formulates policies with an eye to maximizing electoral rewards is of interest. The authors highlight the tendency toward piecemeal policy and special purpose policy instruments; the high inertia with respect to reconsideration of policies whose effects on real income distribution are blurred and diffuse; espousal of policies which appear to redistribute from the rich to the poor. The detailed discussion of the political decision-making process is framed in the context of foreign exchange policy, which the authors feel was badly handled in the early 'sixties when a somewhat extreme version of the “disequilibrium system” involving an overvalued currency, quantitative controls, and administrative pricing was chosen rather than an exchange rate closer to equilibrium, which would have allowed the market to function more effectively. It is argued that this disequilibrium system is, in fact, the policy which maximizes the electoral support of the government, given the electorate's perceptions of the effects of foreign exchange policy.

By force of circumstance, the discussion of policy making is not supported with quantitative or other information which would help the reader appraise the various contentions as against alternative hypotheses. While this omission makes it hard to assess the validity of

some of the contentions, this section should be read by anyone who feels that the decision maker can for a moment restrict himself to the economic aspects of the issues at hand. It will, one hopes, provide grist for future researchers on these important issues. For the moment, it provides a useful framework within which to conceive the functioning of the system.

In summary, the economic side of the book is provocative. Clear framing of interesting hypotheses is stronger than empirical evaluation; in several cases, more recent data and interpretations tend to contradict the conclusions. The eternal dilemma of "how far to interpret weak data" is well illustrated here. One of the book's strong points is the neatly reasoned integration of disparate pieces of evidence; yet, when some of the pieces turn out to have been misleading, the reader may be at something of a loss as to how to "adjust" the results.

All in all, the book warrants wide readership: Economists can benefit from the clear discussion of policymaking and politics in a framework of issues familiar to them; political scientists can symmetrically benefit from the clear discussion of economic issues in a framework they understand.

R. A. BERRY

University of Western Ontario, Canada

Politics in Newfoundland. By S. J. R. Noel.
(Toronto: University of Toronto Press, 1971.
Pp. 328. \$13.50.)

Newfoundland politics has received scant attention in the literature of political science. Most people associate Canada's easternmost province with its airport at Gander, and few are aware of its distinctive political history or style of politics; from 1855 to 1933, Newfoundland enjoyed responsible government, first as a self-governing colony and later as a dominion in the British Commonwealth. Politics hardly resembled party government, British or Canadian style. Instead, Newfoundland was governed by a succession of fluid factions and parties of St. John's merchants and lawyers who gained support from the sparsely populated periphery through liberal application of patronage and spoils. Faced with bankruptcy as a result of the depression and continuing mismanagement, Newfoundland surrendered its sovereignty in 1933 and consented to be ruled by a commission of British civil servants. In 1949, Newfoundland became Canada's tenth province, governed by Joseph R. Smallwood, the only living father of Canadian confederation and a self-styled Huey Long of the north.

Under the Smallwood administration, the earlier patterns of patronage and spoils continued alongside massive (and usually unsuccessful) efforts to develop the island's economy. Employing his own populist skills as well as the material benefits of confederation (Newfoundland was plugged into the Canadian welfare system), Smallwood dominated the island's politics, ruling as a virtual dictator, until his defeat in 1972.

S. J. R. Noel's *Politics in Newfoundland* purports "to analyse the forces shaping the politics of the island during its decline from independent dominion status to bureaucratic dictatorship and its subsequent conversion into a province of Canada" (p. vii). In clearly written prose, Noel, an historian, examines the major events and intrigues of Newfoundland's political history, focusing on the rise and fall of political leaders, shifting alliances, deals and scandals, foreign relations, and the island's economy. In doing so, the author provides us with a sketch of a centralized political system in which cabals of politicians governed an island dotted with remote and destitute poor fishing villages strung out along 6,000 miles of coastline. Isolated from each other and from the capital at St. John's, but at the same time dependent on the St. John's "fishocracy" for credit and supplies, the outports elected St. John's merchants and lawyers to represent them. Parachuted into their constituencies, elected representatives served as the main link between center and periphery, channeling some patronage and benefits to their districts while engaging in a struggle for wealth and power in St. John's.

Because Noel is preoccupied with the development of a lucid historical narrative, we never learn as much as we should about "the forces shaping politics." Why, for example, did such a system persist? Throughout the book, Noel places a great deal of emphasis on animosities between Catholics and Protestants. Although these tensions were minimized early on by a proportional allocation of spoils, Noel claims that "sectarian" or "denominational" questions were used to swing several elections (but he provides no tables or charts enabling the reader to see just how Protestant, Catholic, or mixed districts voted) and that religious tensions prevented the growth of class consciousness. While this is probably true, it does not completely explain the general absence of protest movements or mass-based political parties. Early on, Noel suggests that the remoteness of the outports and their economic dependence on St. John's were inimical to political organization. But

later in the book, he describes the rise of the Fisherman's Protective Union (the exception to the rule) on the northeast coast. In this instance, Noel claims that relative poverty, communal ties among villages, and participation in the dangerous Labrador fishery facilitated the spread of the union movement. But if conditions were so favorable, why did the union movement disintegrate when its leader abandoned it some years later, and why didn't the movement spread further? Noel tells us nothing about the former problem, and attributes failure of the movement to religious differences (the F.P.U. was predominantly Protestant) and differences in social and economic structure between the northeast coast and other parts of the island. But were the differences indeed that great?

What is missing in the book is an analysis of the political culture and social structure of Newfoundland. In commenting on the continuity of political style and practices in Newfoundland, Noel alludes to a persistent political culture which has survived despite changes in regime and constitutional status. Nowhere in the book, however, does he tell us what the elements of this political culture are or how they contributed the kind of politics which Noel describes. Yet surely some analysis of the level of social trust, cynicism, and fatalism in Newfoundland outports, coupled with an analysis of social structure, particularly relationships between fisherman and local notables—merchants, ministers, and priests—would go a long way toward explaining the absence and failure of protest movements and the persistence of the system.

From the point of view of political science, one of the greatest shortcomings of the book is failure to develop a comparative context that could tell us what Newfoundland exemplifies. Reflecting on the decision of the British government and Canadian bankers to place the island under Commission rule rather than allow it to default on interest payments, Noel argues that the patronage-dominated politics of Newfoundland may not have been all that different from the politics of Quebec or New Brunswick or other remote, less developed parts of Canada. True enough. However, the author fails to make the point that the politics of Newfoundland, past or present, are not all that different from the politics of many underdeveloped or partially developed regions or nations: the marginal position of the average voter eking out his existence in a semifudal relationship to a local notable provides a ready-made base for patron-client

relationships. Dependency on distant outside forces provides opportunities for brokers and intermediaries. Party alignments are fluid because voters become attached to particular patrons and not party labels or doctrines.

It is perhaps unfair to berate an historian for not answering a political scientist's questions. Noel's book is eminently readable and provides an excellent background for anyone interested in either current Newfoundland politics or Canadian provincial politics. Moreover, by tracing the machinations of Newfoundland politicians, Noel provides us with the historical description which must be a prelude to systematic analysis.

STEVEN B. WOLINETZ

Memorial University of Newfoundland

Russia Enters the 20th Century. Edited by Erwin Oberländer. (New York: Schocken Books, 1971. Pp. 352. \$12.50.)

This series of cameos reveals how, in many respects, the Soviet regime represents a reversion to the traditional Russian pattern of political centralism and territorial expansion. They offer something of a contrast with the consistent and accelerated western involvement in the forces of nationalism, liberalism, humanitarianism, and industrialization. The essays reflect a general dynamism in all aspects of Russian life, but retarded by archaic attitudes of the "ruling spheres," and the inertia of the lumbering bureaucracy.

There is relatively little new information or interpretation in these studies except in specialized investigations like the analysis by Professor Dahm (of the State Institute of Oriental and International Studies at Cologne) of Russian philosophical writings and the investigation into the Moslem intellectual revival by Professor Bräker (of the same Institute). The essays are, of necessity condensed and often sketchy, yet interpretations are sufficiently lucid. Professors Katkov (Oxford) and Futrell (University of British Columbia) in their consideration of foreign policies observe the moderation of expansive and centralist currents by the turn of the century and argue that continued international instability, as reflected by world conflict, plus Bolshevik ideology brought a resurgence of statist autocracy and territorial expansion. The reader would appreciate an elaboration of the promise of investigating the process of decision making and implementation. For example, Witte's independent initiative would seem to imply incomplete control by autocracy over influential figures.

The article by Professor Schultz (Göttingen) on constitutional law performs a distinct service in focusing on the positive legislative activities of the Provisional Government in the areas of civil liberties and judicial safeguards. This offers some antidote to the unrelieved impression of its complete flaccidity. The movement away from centralized, aristocratic control is adequately determined. But the extent of the exclusion of the nobility from the zemstvos would seem to be overstated. The conservative nobility was able to block the establishment of the "small zemstvos" in the post-1905 period. And the reader might find the term "bourgeois" cavalierly handled. The Octobrists included all important bourgeois elements, but they are dominated by the moderately liberal landowning nobility in the spirit of the reform tradition of the 1860s. The Kadets were intellectuals, and their "bourgeois" character has to be carefully qualified in terms of Marx's "cash nexus."

In his statement on political parties Professor Oberländer (Institute for Oriental Studies, Cologne) properly focuses on the question of the course of the revolution. The Soviet position on the inevitability of a Bolshevik victory is clear. But in the United States the center of controversy focuses on the inevitability of revolution—with or without world war. In this connection the progressive isolation of the regime from its loyal support is significant and is related to its obvious inadequacy during the war. The cursory treatment of the Duma gives no real indication of the impact of parliamentary experience; even the "constitutionalist" Stolypin resigned in the face of parliamentary opposition.

Both Professors Thalheim (Berlin) on industry and Willets (Oxford) on Agriculture stress weak agrarian technological development as a key element in conditioning the slow emergence of Russia from an underdeveloped status. Willets particularly notes the refusal of the intellectual opposition to recognize the existence of the factor of a low technological level in its antagonism to enclosure. Thalheim's comprehensive study of the Russian industrial revolution stresses the traditional military goals and their negative effect on a balanced economy and living standards. Professor Poppe's (Leningrad and Berlin) related discussion of Siberian migration leaves a generally positive impression. The improved economy of the settlers would be more meaningful if compared with the rest of the empire, and analysis of returnee activity is skimpy.

The discussion by Dr. Connolly, the British expert on ethnic minorities, reveals still another

facet of the regime's tendency to violate its own rules and develop a stimulant for minority nationalism. Miss Connolly correctly stresses the essentially autonomist nature of the effective minority leadership. Because of its peculiarities the reader might wonder about the omission of the "Jewish Question." In a study of a special minority, Professor Bräker's enlightening account tells us that the rise of Moslem nationalisms in the nineteenth century reflects features not uncommon in the West and is related to the impact of faith and positivism on the Russian intellectual scene.

Professor Simon (Cologne), turning to the Orthodox Church, competently argues for the dynamic nature of Church activity at the turn of the century; and for reasons resembling those of the seventeenth century—competition with dynamic "sects."

Professors Dahm, discussing philosophy, and Stenbok-Fermor (Stanford) analyzing the Silver Age of Russian literature, project trends away from idealism toward natural morality and positivism. And Professor Anweiler (Ruhr University) recounts the realistic effort of educational reformers to promote stability in Russian society through vocational training. On the whole the collection offers an updated perspective on continuity and change in Russia at the turn of the century.

ALFRED LEVIN

Kent State University

The Army in Papua-New Guinea. By Robert J. O'Neill. (Canberra: Australian National University Press, 1971. Pp. 31. \$1.95.)

As Papua New Guinea (PNG) approaches independence, a question often asked is, "What will be the role of the army after independence?" Knowledge about the army in PNG has been limited, largely because it is part of the Australian army and therefore answerable to the Australian parliament, not to Papuan New Guineans. Writings about it have thus been either intellectually biased or, more usually, based on army press releases. O'Neill has the advantage of being both an ex-insider (formerly a career officer in the Australian army) and also a scholar of some repute. It is therefore disappointing to find that his monograph is more descriptive than analytical, more suited to a journalist than an academician. But it does at least correct some of the inaccurate and misleading reports of the calling out of the army in aid to the civil power in 1970 (pp. 14-15), and it does discuss some of the possible conflicts and difficulties which face the future PNG army.

O'Neill's use of words is surprising at times. Regarding the maintenance of internal law and order, he says that "after the recent disturbances . . . the PIR [Pacific Islands Regiment] has been given this *additional* role" (p. 11) (emphasis added). But armies usually have this role, and certainly one early Commanding Officer of PIR was aware of it: The difference in 1970 was that the role was publicly stated and there was a possibility of having to carry it out. O'Neill points out that the administration overreacted in this situation (p. 13), which belies his contention that there is "close consultation and cooperation" between the army and the administration (p. 4). The 1970 situation pointed to a lack of understanding about the army's capabilities and functions on the administration's part and possibly also to the army's failure to adequately inform the administration on these matters. O'Neill notes that the PI (Pacific Islands) soldiers "have little real idea what it takes to lead a political organisation or to run a government" (p. 17) without also pointing out the implications of this if the soldiery become dissatisfied with the way in which the country is being run.

O'Neill's perspective on Australian military relations with an independent PNG is unconsciously revealing. He believes that Australia should provide financial and logistic support, but that a tied grant would be necessary, although this would imply "some limitation on sovereignty" (p. 28). He admits that this logistical dependence "places a ready tool in Canberra's hand which could cripple the power of the military in a short space of time" (p. 26), but implies that it is desirable that Australia "can still exercise some degree of control in a New Guinea crisis," although this could be "embarrassing" (p. 30). A natural Australian view, but a chilling thought for a newly independent government.

PETA COLEBATCH

University of Sussex, England

Bulgarian Communism: The Road to Power, 1934-1944. By Nissan Oren. (New York: Columbia University Press, 1971. Pp. 293. \$12.50.)

Those of us who consulted Nissan Oren's history of the Bulgarian Communist Party, 1934-1944 when it was still in doctoral dissertation form found it a supremely authoritative narrative and analysis that would worthily complement Joseph Rothschild's "The Communist Party of Bulgaria: Origins and Development, 1883-1936." With the works of these two scholars, the history of the Bulgarian Commu-

nist movement has been covered more thoroughly than any Eastern European Communist movement.

Actually, Oren's book is even better and fuller than his dissertation. For since 1960 (when his dissertation was presented) he has done further research on the subject, including study in archives in Sofia and personal interviews with veteran Bulgarian Communists who played a part in the events he describes.

The main theme of Oren's work is the interaction between the BCP in Bulgaria (outlawed during the period covered) and the Bulgarian Communists who had emigrated to the Soviet Union. These latter included not only Dimitrov and Kolarov but also Vulko Chervenkov, who was later to become Bulgaria's Stalinist dictator and the most influential figure in postwar Bulgarian Communism. Dimitrov, of course, became world-famous as early as 1933, but a point which Oren documents very clearly is the relatively small influence he had on the Party in Bulgaria, and even on many BCP members in Moscow, for several years in the 'thirties. Only when the Comintern endorsed the Popular Front tactic and Stalin moved decisively against his own "leftist sectarians" was the authority of Dimitrov secured. (His victory resulted in the death or imprisonment of many Bulgarians in the Soviet Union. Dimitrov himself, though hardly emerging with great credit from this bloody episode, comes off considerably better than the vengeful Kolarov.)

The most exciting part of the book is the chapters covering the BCP at war. Here, the problems facing the Communists in mounting a real resistance campaign, their isolation from a population relatively prosperous and fully satisfied over the (temporary) return of Bulgaria's lost territories, the BCP's uneasy relations with Tito, the significance of Macedonia, the real heroism of many Bulgarian Communists toward the end of the war, and, finally, the maze of negotiation and intrigue leading up to September 9, 1944—all this is handled by Oren with enviable clarity and a complete mastery of his sources. In fact, Oren's knowledge and control of his sources is perhaps the outstanding aspect of the whole book. What Oren gives us is the essence of what seems to be a practically inexhaustible reservoir of knowledge on the subject.

Criticisms? An occasional brief character sketch of prominent BCP leaders would have lent flesh and color to the book. More seriously, Oren's conclusion is tantalizingly short. It contains enough WISDOM and flashes of insight to convince the reader that he could have

had a magisterial summary of the place and the problems of Bulgarian Communism in the context of Bulgarian history as a whole. Perhaps in his forthcoming study on the sovietization of Bulgaria after 1944, Oren will satisfy the appetite he has whetted in those last few pages.

J. F. BROWN

Radio Free Europe, Munich

Soviet Image of Contemporary Latin America:

A Documentary History, 1960-1968. By J. Gregory Oswald. (Austin: University of Texas Press, 1970. Pp. xvi, 365. \$15.00.)

This formidable volume is a compilation of translated Soviet Russian writings on the current Latin-American scene. The work presents a cross-section of official and academic viewpoints. In general, the latter reflect a fairly well-established division of labor among Soviet scholars concerned with Latin America. Some of the materials, on the one hand, were produced by the Latin-American Institute of the Academy of Sciences. This institute, established in 1961, is concerned primarily with the contemporary economic and political problems of the Americas. There is also represented, on the other hand, some of the work of the Latin-American Sector of the Institute of History of the Academy of Sciences; that sector's work here is historical rather than contemporary in emphasis and deals with a somewhat wider range of Latin-American themes.

While some readers might be impressed by the range of analyses and opinions developed by the Soviet writers included in this enterprise, their work—whether official or academic, contemporary or historical—falls basically within a fairly rigid framework of Marxist-Leninist interpretation. The selected materials cover such matters as the Castro Revolution in Cuba, national liberation movements in Latin America, reform programs, the role of the Catholic Church, labor and trade unionism, and problems of the rural-urban dichotomy.

Essentially, the Cuban materials pursue two fundamental theses. The first does what it can to portray the missile crisis of 1962 as a victory for Soviet diplomacy. The second reflects a post-1962 decline in Soviet interest in, and knowledge of, developments in Cuba. "Research into the development of the revolutionary process in Cuba is an extremely complex problem," M. S. Al'perovich wrote after the middle 1960s in *Sovetskaia istoriografiia stran Latinskoi Ameriki*. "Thus it is not surprising that Soviet specialists have not yet supplied clear and exhaustive answers to many of the problems connected with the revolutionary

events in Cuba, and that in a number of instances their opinions diverge considerably" (p. 309).

Two basic propositions are espoused in the included Soviet writing on national liberation movements in Latin America. It is argued, in the first place, that the Cuban experience is not applicable to the bulk of these movements. There is, second, a somewhat subtle but nonetheless clear anti-Chinese Communist line in the Soviet writing about national liberation in Latin America. The Soviet writers are almost uniformly negatively critical of the programs developed by such non-Communist reform movements as the *Apristas* of Perú, *Acción Democrática* of Venezuela, and the leftist regimes led in Costa Rica by José Figueres. In the view of A. F. Shul'govskii, the main Soviet writer in this field, the chief aim of such reformers is to "subordinate the national-liberation movement to their influence and to distort its true aims and purposes" (p. 69). The sections on the Catholic Church strike this reviewer as being the least original, and the least peculiarly Soviet, portions of the book. Little more is said here than that the political influence of the Church has been in decline for some time. This observation has been made so long by so many writers in so many languages that it seems superfluous to translate it from the Russian.

On the labor front, the quoted writers express concern about the divisive schisms in Latin-American trade unionism represented by the emergence of such anti- and non-Communist labor organizations as the Inter-American Regional Labor Organization (ORIT), the *Agrupación de Trabajadores Latinoamericanos Sindicalizados* (ATLAS), and the American Institute for Free Labor Development (AIFLD). Here the Soviet writers express the hope for eventual reunification of the Latin-American labor movement under the ægis of the more Marxist *Confederación de Trabajadores de América Latina* (CTAL). Soviet views, both official and academic, on rural-urban problems are represented weakly in Oswald's collection. The excerpts printed here are concerned chiefly with attacks on the program of the *Movimiento Nacionalista Revolucionario* (MNR) in Bolivia, and against rural reforms reflecting Chinese-type Communist approaches.

The compilation thus documents a Soviet view of Latin America not only filtered through a Marxist-Leninist analytical structure but also colored by policy positions on a number of contemporary problems of the American republics. These positions include a standoffish and tentative posture toward the Cuban experi-

ence, coupled with a warning that it not be taken as a model for revolutionary movements in other countries. The Soviet writers also express hostility toward Chinese Communist influences in the Americas, on the one hand, and, on the other, toward such indigenous Latin-American anti- and non-Communist reform movements as APRA, *Acción Democrática*, and the Christian Democratic movement.

Soviet Image of Contemporary Latin America is an impressive volume, the result of a seven-year project. Moreover, a number of hands contributed to the venture. The central task of compiling and translating the Russian-language materials was done by Oswald. The book was edited by Robert G. Carlton, and varied types of assistance were provided by the Conference on Latin-American History. The foreword was written by the late Howard F. Cline of the Hispanic Foundation and the introduction by Herbert S. Dinérstein of the School of Advanced International Studies. A result is the somewhat ironic sense of top-heavy bureaucracy among the Americans producing a book about bureaucracy in Soviet scholarship. A further disturbing element is the reiterated "Watch-out,-you-are-reading-Communist-propaganda" warning, given judiciously by Oswald himself but repeatedly hammered at by the various supporters, aides, and well-wishers of the study as well. The reader thus comes to feel that he is being treated as though he were a youngster watching a motion picture he should not be permitted to see without parental guidance. Nevertheless, the work emerges, on balance, as a major and admirable piece of well-documented scholarship, likely to stand for some time as an authoritative source of information on Soviet views of Latin America during the 1960s.

GEORGE I. BLANKSTEN

Northwestern University

Hispanismo, 1898–1936: Spanish Conservatives and Liberals and Their Relations with Spanish America. By Fredrick B. Pike. (Notre Dame: University of Notre Dame Press, 1971. Pp. xx, 486. \$15.00.)

The *hispanismo* about which History Professor Pike, of the University of Notre Dame, tells us here is a Spanish-led movement (also at times called *hispanoamericanismo*, Pan-Hispanism, or *hispanidad*) that has long sought to strengthen ties between Spain and the countries that once were her colonies in America. Prior to Pike's book, little scholarly research on the movement had been published in English, and even the voluminous materials printed in Span-

ish consisted mostly of what are in effect primary sources written by Spanish and Spanish American advocates or foes of the movement rather than studies aimed at objectively portraying and analyzing the history of *hispanismo*. In the *Political Science Quarterly* of September, 1922 (pp. 389–414) J. Fred Rippy published an article entitled "Pan-Hispanic Propaganda in Hispanic America," treating the history of the subject up to that date; it later appeared in nearly the same form in Rippy's *Latin America in World Politics* (New York: Knopf, 1928). In 1959 the University of California Press issued Mark Van Aken's modest-sized book, *Pan-Hispanism: Its Origin and Development to 1866*. To this slim output is now added Pike's substantial volume on the period from 1898 to 1936, going much beyond Professor Rippy's article in extent and depth of treatment and in the terminal date of the study. It should be noted, however, that Pike deals mainly with the Spanish advocates and supporters of the movement, giving only limited space to its reception by the Americans.

Van Aken, Rippy, and I (in introductory parts of my doctoral thesis entitled *Hispanidad in South America, 1936–1945*, available only on microfilm as Publication No. 2321 of University Microfilms, Ann Arbor, Michigan, 1951) pictured *hispanismo* prior to 1936 as seeking cultural, economic, and political rapprochement and solidarity between Spain and Spanish America largely to defend the Hispanic race and civilization (often particularly from the United States) and to promote the international influence, prestige, and trade of Spain. While presenting considerable evidence of these features of the movement, Pike stresses in *hispanismo*'s defensive posture what his predecessors mostly overlooked—the frequent aim of preventing social revolution and preserving elite rule throughout the Hispanic world. Because he sees this purpose as an outgrowth of Spaniards' concern about threats to the existing order at home, a little more than a third of his book is devoted to social and political problems in Spain alone and particularly to the ideas expounded there for coping with them. Most of the rest of the volume deals directly with Spaniards' thoughts about their Spanish American ties and with their specific efforts to promote those ties through cultural, commercial, and other channels. In addition to describing such efforts and their limited results, Pike also analyzes and evaluates the strengths and weaknesses of *hispanismo* as a whole up to 1936.

Although I saw Spain's *hispanidad* of 1936–1945 as seeking to promote in Spanish

America a philosophy in tune with the fascism and strong Catholicism of the Franco regime. I did not view the pre-1936 *hispanismo* of Spain (except in so far as it involved immediate precursors of the Franquistas) as embodying a strong social conservatism. Pike maintains, however, that both the liberal and the conservative promoters of the movement in the mother country for decades prior to 1936 were in agreement in their deep concern about warding off revolution at home, the main difference between them being the strong Catholicism of the conservatives as contrasted with the anticlericalism and laicism of the liberals. According to him, these Spanish advocates of *hispanismo* believed they could receive needed strength to check revolution through coöperation with like-minded Spanish Americans in defense of the traditional and still existing hierarchical social order, regarded as essential in the value structure of the Hispanic world. Pike has gone much more thoroughly into the sources for the 1898–1936 period than his predecessors did, and he has buttressed his work as a whole with very extensive and impressive documentation. The 138 pages of footnotes that follow his 321 pages of text are mostly devoted to indicating and sometimes briefly discussing his sources, which are nearly all published items and largely, for his purposes, primary materials, a great many of them books and periodicals that he used during a year's research in the National Library in Madrid. One might possibly ask if the overall evidence warrants quite as much emphasis as Pike places on the antirevolutionary goal of Spanish *hispanismo*, but that would come close to cavilling. In its painstaking treatment of Spanish thought and action regarding Spanish America during the period covered, his book goes far to fill a virtual void on a subject that is important to students of Spain, Latin America, and international relations.

WILLIAM B. BRISTOL

Union College

Politics in Independent Poland, 1921–1939:

The Crisis of Constitutional Government. By Antony Polonsky. (London and New York: Oxford University Press, 1972. Pp. 572, \$24.00.)

Almost without exception, studies of "developing lands" or "emerging nations" have focused on Asia, Africa, or Latin America as the geographical regions in which the patterns of evolution from colonial possession to sovereign political status are available for examination. Those scholars treating East Europe after 1918 have tended to concern themselves with traditional discussions of foreign policy, economics,

or political history within the narrow framework of a given country or time period. Yet in many ways this part of the world should be considered as containing a form of "developing nation." It had lived under an imperial rule and colonial exploitation for a long time; it was ruled forcefully by powerful, alien powers, either directly or through loyal natives; and it spawned a powerful drive for national independence that intensified as the economics became more sophisticated in response to the demands of the industrial era.

The leaders and spokesmen for these East European liberation movements gave force and legitimacy to their causes by drawing upon the past achievements of their nations for proof that they were merely the latest heirs to the "state consciousness" of the medieval or early modern empires that had played important roles in the international affairs of their day. Accordingly, when World War I brought them their independence, all of these countries faced the economic, social, and cultural problems of industrialization and modernization—not to mention that of survival in the hostile environment of contemporary Europe—under the strong influence of their political past. When examined within this perspective, East Europe between world wars not only becomes more intelligible to the Western scholar, but also provides a new model of development that in many ways is close to the historical experiences of the American or West European observer.

Antony Polonsky's study of interwar Polish politics, despite several tantalizing hints, fails to take full advantage of this approach to contemporary history and politics. Although he overlooked many basic and easily accessible archival materials both inside and outside of Poland, nonetheless the author amassed a considerable body of facts and statistics concerning the economic and political life of the Second Republic. However, the absence of a viable methodological framework within which to present and analyze his material leaves it simply a mass of unrelated information and data from which the reader must draw his own conclusions on the interwar Polish experience. The book is divided into chronological chapters that concentrate on three basic topics: purely internal political developments, economic and, to a lesser extent, social trends; and Polish foreign policy. While each section in itself is a good if superficial study, the lack of a broad perspective prevents the author from utilizing the full potential of the problem at hand. The net result is a frustrating lack of coherence that deprives the work of any true scholarly significance.

The above remarks should not obscure the

relative merits of Polonsky's work. The author does present, for the first time in English, the fruits of both memoir and scholarly publication in Poland covering the period treated, and he has included a good amount of statistical data that should aid future researchers who are interested in problems of development and cannot read the original Polish sources. But these strengths are countered, and sometimes nullified, by the negative aspects of the book. Its research base, and hence its factual material, is perceptibly unbalanced in favor of the 1920s, with relatively little emphasis on the crucial final years of the Republic. Moreover, much of the potential impact of the work is lost through careless editing and occasional factual errors; for example, Gen. Edward Smigly-Rydz was not the Minister of Defense in the "People's Government" of Jędrzej Moraczewski, but in the short-lived cabinet of Socialist leader Ignacy Daszyński, a fact that played an important role in Polish politics after 1935. Finally, the laborious and stilted style, laced with occasional clichés, makes reading the book a major chore, although the faulty editing of the publisher is chiefly to blame for this flaw. In short, Polonsky has provided a useful introductory survey of interwar Poland's transition from a liberal parliamentary democracy through a traditional military-bureaucratic dictatorship to what was emerging as a quasi-Fascist regime by 1939, but the shortcomings of the work prevent it from contributing any meaningful analysis to the study of development politics.

Institutions of Economic Growth: A Theory of Conflict Management in Developing Countries. By John P. Powelson. (Princeton: Princeton University Press, 1972. Pp. 281. \$10.00.)

Institutions of Economic Growth is a welcome contribution to the growing literature on change and development for three main reasons: First, Professor Powelson is an experienced economist who maintains that "Economics has run its course in the explanation of growth . . . the next step is to merge sociological and economic models" (p. 197). Second, the chief thesis of the book relates to a central topic in development theory: "Why, in some countries is economic growth stopped by internal quarrels and mistrust? Why, in others, do competitors not only control but use them to promote growth?" (p. ix). Third, the author devotes considerable attention to policy implications and recommendations.

On the basis of a succinct but critical evaluation of models of economic development, Powelson suggests that a nation's capacity to produce institutions to manage conflicts determines whether a sustained growth will follow the take-off stage. Since not all institutions are conducive to conflict management, the criterion of "institutional effectiveness" is postulated. Essentially, institutional effectiveness is a measurement of an institution's capacity to identify conflicts within its jurisdiction so that all contestants understand them, to institutionalize well-defined norms of resolution, and to command the consensus of concerned people that the institution is more appropriate than other feasible alternatives.

Conceptualizing of institutional effectiveness in terms of conflict-resolving power, places Powelson's theory in a nonideological domain. Thus, regardless of the normative or existential rationalization given to a particular institution in a political system, its value is assessed only in relation to its institutional effectiveness. An extended family system, or a one-party rule might be as adequate to development as a nuclear family or a multi-party system given the institutional effectiveness criterion.

That different institutions may perform similar functions is an established observation in the literature. The contribution of *Institutions*, however, is in advancing a micro- and a macro-theory of institution building which if empirically tested may permit predictions on the types of institutions that power groups in various nations establish as well as on the replacement rates of institutions.

Utilizing a cost-benefit framework Powelson suggests that "If the benefits of an institution exceed its cost, and if the beneficiaries are either able to compensate those who pay the cost or force them to yield with adequate or no compensation, then the new institution will be formed" (p. 116). Although intuitively appealing, the asymmetry between demand and supply prices in the market of institutions, poses a serious problem to operationalization and hence the testability of the proposition. Moreover, in spite of the suggested heuristic design to measure costs, benefits, and institutional effectiveness, the problem of *how much* benefits must exceed costs before a new institution emerges, is not treated carefully enough.

Another limitation relates to the criterion for the selection of institutions. The theory states that growth-sensitive groups select those institutions whose effectiveness rating is perceived to be high enough to increase the gross national product at an annual rate which is believed to

have a value at least equal to the cost of acquiring the institution (p. 120). But, if the cost of changing an institution equals the perceived rating, why bother with a new institution? Further, the perceptions of growth-sensitive groups about the effectiveness of institutions may not coincide with reality. This may lead to the selection of malfunctioning institutions. A correction option is explicated in the theory. Yet establishing a malfunctioning institution even for a short run is too costly for a developing nation.

Whereas at the micro level Powelson emphasizes the choice between single institutions ruling out value change as a cost, at the macro level the focus shifts to institutional types and their relations to national values. In the long run, institutional types are to conform to national consensus on economic and political ideology. Consensus is achieved either through successive institution formation, or direct pursuit of ideology, or a mixture of the two. Successive institution formation leads to selection of an ideology because each chosen type of institution makes easier a subsequent choice of the same kind of institution. To justify all choices, an ideology is necessary. On the other hand, in the case of direct pursuit, power groups select an ideology and form economic and political theories to support it.

This last point explains, according to the author, the American failure in Latin America. The U.S. policy has two goals: One is to promote economic growth in these countries. The other is to persuade power groups to adopt an ideology and institutions similar to those of the U.S. These two goals are in direct conflict. The American ideology is not the one by which consensus will be achieved at least cost. Indeed, the effect of the U.S. policy has been to deepen and intensify ideological conflicts and to hinder the emergence of authentic but effective institutions.

In conclusion, this should be a stimulating book for anyone concerned about the process by which institutions are built, maintained and transformed. Correspondingly, it should be useful in advanced courses focusing on either political development or political economy.

Uncensored Russia: Protest and Dissent in the Soviet Union. Edited, translated and with commentary by Peter Reddaway. (New York: American Heritage Press, 1972. Pp. 499. \$10.00.)

This is a most informative compilation of material, with insightful commentary, on a sub-

ject of great and increasing importance. Reddaway has faithfully translated, meticulously edited, and skillfully presented the first eleven issues of the unauthorized (hence, from the Kremlin's viewpoint, nonlegal) *samizdat* (self-published) journal, *Chronicle of Current Events*, containing authentic information on the dissenting Soviet "Democratic Movement." The issues assembled here were distributed every two months from April 1968 through December 1969 by anonymous Soviet citizens. By June 1972, twenty-five issues of the *Chronicle* had appeared, but its basic continuity of viewpoint, focus, and style makes these issues representative of the whole. The usefulness of *Uncensored Russia* is enhanced by Mr. Reddaway's perceptive commentaries.

Since, as Reddaway notes (pp. 15, 20) the *Chronicle* is the semi-formal organ of the underground Soviet "Democratic," or "human rights" movement, one finds in it reflections of most of the currents of dissent voiced in the USSR since it began "publication" (in typewritten, sometimes in photocopy form) in 1968. Scholars will find here indispensable source material on the activities of a small but determined and energetic set of men and women who have, as individuals and as members of loosely organized groups, in recent years contested, protested, resisted, criticized, and exposed Kremlin policies, decisions, administrative and court actions, and laws that they regarded as unjust. The reader will also learn how the Soviet regime treats dissenters. Its tactics include blandishments, threats, and harassments of KGB (political police) interrogators, and the accusations and pronouncements of journalists, prosecutors and judges, followed by sentencing to prisons, forced labor camps, and special "psychiatric hospitals" of citizens the authorities find "socially dangerous." Sometimes they include the brutal, sadistic behavior of prison, camp, and mental hospital personnel.

The duel between the exponents of the official political culture and the dissenting counter-culture, or, in Reddaway's words between "Enormous physical strength on the one side, tremendous moral strength on the other" (p. 438) is grim, tense, and dynamic: The odds of course are, at least for the present, heavily on the side of the regime, but the dissenters have won moral victories, have probably prevented repression from being more severe than it might have been, and even at times have forced the authorities to retreat—as in the cases of the arbitrary commitment to mental institutions, and subsequent release, of the mathematician and poet Esenin-Volpin and the biologist Zhores

Medvedev; Esenin-Volpin, in a dramatic reversal of official policy was allowed with a number of other leading dissidents of Jewish or partly Jewish ancestry, to leave the USSR in June 1972.

The illuminating introduction (pp. 15-42) and the fascinating "Foreword of an Eyewitness," by the mathematician Julius Telesin, who emigrated to Israel in 1970, add much to the book's value, as do the extraordinary photographs, some smuggled out of labor camps, and the map (p. 204) of the Mordovian labor colonies.

Uncensored Russia's twenty chapters are classified thematically, and to a degree geographically, in terms of: a first chapter on "The *Chronicle* about Itself"; eight on "mainstream" dissent, beginning with events connected with the trial of the writers Andrei Sinyavski and Yuli Daniel, in February 1966 and ending with the "Case of the Baltic Fleet Officers," in 1969; three chapters on camps, prisons, and mental hospitals, five on "individual streams" (The Crimean Tatars, The Meskhetians, The Ukrainians, The Jews, and The Churches); two on "mainstream publications" (mostly on Alexander Solzhenitsyn and on writings by or about Andrei Amalrik, Andrei Sakharov, and Valeri Chalidze, as well as expressions of anti-regime opinion on the 1968 invasion of Czechoslovakia); and two final, miscellaneous chapters entitled, respectively, "Tributaries," and "Dams," dealing, in turn, with "Leningrad and the Provinces" and with "Stalin, Stalinists, Fascists and Censors." In this last chapter one finds the *Chronicle's* limited references to "right wing" dissent—this material is briefly supplemented in a footnote (pp. 430-433, and footnote 45, p. 485), referring to issue No. 17, published in December, 1970.

In the introduction, and in brief, perceptive comments elsewhere Reddaway seeks to explain the behavior of Soviet dissenters and the response thereto of the authorities. He highlights Khrushchev's 1956 denunciation of Stalin, which, he writes (p. 22), transformed well-known information about Stalin's "torture and execution of millions and the deportation of whole nations" into "legitimate subjects for reflection, discussion, written analysis." However, since Khrushchev's fall "reformism within the system has become increasingly difficult, and the birth of the Democratic Movement is one of the results" (p. 23). As for the regime's policy toward dissent, Reddaway describes it as one of "hesitant repression" (p. 27). He appears to share the view of Andrei Amalrik, expressed, however, before Amalrik's current sentence to three years in a strict regime labor camp in

Magadan, that the regime is too weak to resort to mass arrests of critics. The course of events since *Uncensored Russia* went to press has, on the whole, confirmed the soundness of this view. To be sure, in January 1972 Vladimir Bukovski, probably because he had done so much to expose the KGB's practice of imprisoning regime critics in "special psychiatric hospitals," received an exceptionally severe sentence for having allegedly "defamed" the Soviet system, but in March and June of the same year the twenty-fourth and twenty-fifth issues of the *Chronicle* appeared. Prominent dissenters such as Andrei Sakharov and Alexander Solzhenitsyn, though subjected to harassment or ostracism, remained at liberty. In January 1972, however, prominent Ukrainian intellectuals, including Vyacheslav Chornovil, who had already served a three-year term in a camp, were detained, and charges were brought against some of them; and in June a number of Lithuanians were arrested for alleged antiregime protests. Also in June, 1972, the historian Peter Yakir, who had hitherto stayed out of jail, despite years of persistent—but scrupulously legal—activity in the struggle for civil rights, was arrested for "anticonstitutional" behavior. Previously Yakir had been spared, probably because the leadership wished to avoid to appear to be persecuting the son of one of Stalin's most celebrated victims. Yakir's father, Iona, was a Marshal of the Soviet Union; Khrushchev had expressed public indignation about his fate and friendly interest in his son.

It seems safe to say that all serious students of dissent in the USSR will hail Professor Reddaway's valuable contribution. Many, doubtless including Mr. Reddaway, will wish for greater elaboration of analysis as we steadily deepen and widen our factual knowledge—to which the dedicated labors of Reddaway, Abraham Brumberg, Karel van het Reve, Max Hayward, Leopold Labedz, Albert Boiter, and others have indispensably contributed. The historical perspectives and insights offered by Professor Reddaway are fundamental to understanding the complex and contradictory phenomena of Soviet dissent, which bears, as he points out, many resemblances to pre-Soviet Russian protest movements, but also differs substantially from them—particularly in its "respect for law," and its "remarkable mutual tolerance and lack of dogmatism" (p. 24).

This reviewer suggests that understanding could also be enhanced by judicious application of such social science concepts as alienation, frustration, political culture and socialization, interest groups, and social structure, among others—perhaps somewhat along the lines of

Robert Dahl's remarkable work, *Polyarchy*—though it must be acknowledged that the opacity of the data available to the student of this, like other aspects of Soviet politics, interposes formidable obstacles.

Even on the basis of our general knowledge of Soviet politics, amplified by analysis of *samizdat* sources, the development of conflict between the established elite of party and government functionaries, on the one hand, and members of the "creative intelligentsia" of scientists and writers, on the other, is not surprising—though of course we now benefit handsomely from hindsight. Party rule, as presently practiced, both frustrates professionals, as professionals (for example by interfering with access to information they regard as essential to performance of their work) and constitutes an affront to their self-esteem. Of course, a poet like Ėvtushenko is still permitted, or assigned, to travel abroad—but only, it would seem, at the cost of moral compromise intolerable to a Solzhenitsyn.

To some degree the variations in the personal responses of individuals to alienation and frustration may be related to failures of socialization—this may be applicable in the cases of Alexander Ginzburg, the late Yuri Galanskov, who died in a labor camp in 1972 after an operation for ulcers, Vladimir Bukovski, and other still relatively young dissenters, whose families were affected by the traumas of Stalin's purges.

To be sure, one line of speculation about Soviet dissent would view it as a relatively short-run phenomenon, reflecting the delayed impact of World War II, and relative Soviet economic backwardness, now being overcome. This may seem farfetched, but it is striking that there seem to be few if any new recruits, of the caliber of Peter Grigorenko, Yakir or Alexander Solzhenitsyn, for example, in the "Democratic Movement," which is also being weakened by the emigration of its leading Jewish members. The Kremlin may calculate that departure of Jewish dissenters, combined with containment of the resistance of remaining dissidents, by intimidation and selective terror, plus satisfaction of mass cravings for more and better consumer goods and services, and the enhanced effectiveness of the political socialization effort, will cause dissent gradually to subside. However, the data in this book, and events since its publication indicate that the Soviet regime will need great skill to control and contain a society characterized by a growing diversity of aspirations and interests.

Whatever may be the outcome of the struggle between the guardians of an increasingly ir-

relevant official political culture, and exponents of a democratic ethos, struggling to be born, the moral drama that unfolds in *Uncensored Russia* is, as Leonard Schapiro reminds us in the epigraph, one that "no student of Soviet society, or indeed anyone who follows the survival of the human spirit in diversity, can now ignore."

FREDERICK C. BARGHOORN

Yale University

West German Politics. By G. K. Roberts. (New York: Taplinger Publishing Co., Inc., 1972. Pp. 206. \$10.95, cloth; \$5.95, paper.)

This "concise guide to the West German political system" by a lecturer in Politics at the University of Technology, Loughborough, (p. vii) combines four different approaches to the politics of the Federal Republic. Part One briefly surveys German political history from 1848 to 1969 in order to expose the historical roots of current politics. Part Two covers the traditional subject of political institutions; Roberts bases his exposition here on the systems models of Easton and Deutsch, but properly does not allow these models to lead him into glossing over persistent tensions and conflict within the political order. Part Three, "The Political Culture," treats in rapid succession political socialization, political participation, "ideologies" (including, prelates take note, Christianity), and the nature of the political elite and of political leadership. Part Four concentrates on current issues of economic, social, and foreign policy; this section concludes with an assessment of developmental trends in West German politics and a positive verdict on the democratic character of the regime. The chronological coverage of the work extends roughly to mid-1971; comments on the Brandt government are necessarily rather sparse and inconclusive.

In several respects the book represents a promising break with many standard treatments of comparative politics. First, Roberts insists upon the importance of historical background, though his account is rather more brief and simple than one might wish; no four-page account (pp. 14-17) of the decline of the Weimar Republic is likely to be intellectually satisfying. Second, Roberts seeks to understand the evolutionary tendencies of the system; on the whole he anticipates more of the same: greater political stability, greater governmental "administration" of the society, and an increasingly less "ideological" politics—but he does hold open the possibility of a public repudiation of technocracy and concomitant demands

for greater popular participation in decision making. Third, Roberts raises the question, "Is this system democratic? He devotes only two pages to this absolutely fundamental issue and fails to specify his criteria for democratic government, but at least the problem of the moral quality of the government has been broached. One can only regret that Roberts did not deviate still further from the standard format to raise such issues as the quality of the social services that the *Bundesrepublik* offers its citizens, the degree to which "technocracy" presently prevails in West Germany, and the impact of geography and international alliances on West German policy. On all of these matters Roberts makes a promising start, but falls short of the more detailed treatment that these critical issues deserve. The result is a generally solid but not strikingly original volume.

The tone of the book is comfortably centrist. There is no treatment of the youthful opposition other than a brief (and correct) statement that the SPD's adoption of the *Jusos'* policies would lead to electoral losses. "Radicalism" of the left and right are lumped together and dismissed as reflections of an annoying personality trait (pp. 134-5); the author recognizes no basis for radical or even strongly reformist criticism of German society.

On occasion the author makes highly dubious claims ("The Christian Democratic programme [sic] has . . . [maintained] its Christian ethical orientation . . ." [p. 53]) or excessively general ones ("The Second *Reich* collapsed as a result of a combination of environmental stresses [!] and the withdrawal of support by important sections of the political public" [p. 45]). On the whole, however, the book is well executed; there is, for example, an excellent brief discussion of the armed forces. In short, while *West German Politics* does not make significant original contributions to scholarship, as a textbook it is more satisfactory than many of those currently available and merits consideration by teachers of comparative politics and German government.

TIMOTHY A. TILTON

Indiana University

Contemporary Brazil: Issues in Economic and Political Development. Edited by H. Jon Rosenbaum and William G. Tyler. (New York: Praeger Publishers, 1972. Pp. 460. \$20.00.)

The nineteen original essays in this volume provide "a detailed and often technical discussion of a significant development issue or problem which has confronted Brazil during the

past ten years" (p. v). Since almost a decade has elapsed since the Brazilian military overthrew the leftist civilian regime of João Goulart on April 1, 1964, the collection allows us to evaluate political and economic development under the auspices of the military government.

Approximately half the essays deal with political aspects of the military regime. There appears to be some consensus among the contributors that the military's goal is the establishment of a development-oriented authoritarian regime. As outlined by editors H. Jon Rosenbaum and William G. Tyler in their "Introduction," the current political system is characterized by greater centralization of authority than in the past, a depoliticized or apathetic population (in part, the result of military repression), and an elite "mentality" oriented toward national security, with increasing stress on nationalist themes. Although the editors concede that the level of institutionalization of the regime is still low, thus causing it to be dependent on a continually improving economic performance, they conclude that "institutions eventually will be created as a basis for long-term military rule" (p. 26). Rosenbaum and Tyler do not, however, furnish sufficient evidence to support their conclusion.

Most of the essays which focus on politics confirm the editors' contention that political institutionalization is weak. The two political parties organized and sustained by the regime, the "official" government party (ARENA) and the "official" opposition party (the MDB) are, according to Paulo Roberto Motta, elitist organizations which "lack effective links with the people and are not prepared to adjust themselves to a situation of increasing social mobilization" (p. 226). The new bureaucracy, created in an attempt to bypass the "anti-performance" bureaucracy which was a legacy of the pre-1964 system, has, according to Robert Daland, begun to assume many of the characteristics which undermined earlier planning efforts (p. 43). Thomas Bruneau's article on the Catholic Church indicates that the military has yet to demobilize the progressive elements within that institution which are actively opposed to military rule. On the other hand, a more ideologically acceptable Church-affiliated organization such as the Catholic Labor Movement, described by Howard Wiarda, lacks the mass support which would make it useful to the regime. Finally, Robert Myhr argues that the students also have not been incorporated, and have indeed been so repressed that some are turning increasingly to terrorist tactics to vent their frustration.

The only important organized sector of the population which appears to be relatively integrated into the regime and under its control are the labor unions. In a thoughtful essay, Kenneth Erickson illustrates how the military has recognized the utility of tradition in the modernization process by resurrecting the paternalistic, corporate structures characteristic of labor-government relations during the authoritarian regime of Getulio Vargas (1930-1945). A parallel essay on the relationship between the private sector (business) associations and the government, which would have been a useful contribution to the volume, unfortunately has not been included.

That the current regime does not represent a total break with the past is evident not only from the Erickson article but also from the various detailed essays on the economy. Many of the economic policies of the military government were conceived under civilian regimes by technocrats who have continued to serve as key economic decision makers in the present regime. The policies they advocate are often the same ones they supported prior to 1964; only now, the political obstacles which they confronted as civilian decision makers have been reduced or eliminated. Tax reform is a good example. As Harley H. Hinrichs and Dennis J. Mahar note, after 1964 "Brazil achieved in less than a decade tax reforms unparalleled in the nation's eight decades as a federal republic" (p. 191). Other politically unpopular economic policies which the military has implemented include opening Brazil to foreign trade on a scale which, according to Joel Bergsman, is unprecedented since the end of World War II (p. 76), and returning to dependence on export expansion in order to repay a huge external debt incurred in the course of what John Donnelly describes as a successful import substitution effort. In agrarian matters, discussed by Marta Cehelsky, the military has favored the more traditionally acceptable goal of increasing agricultural production under the present land tenure system and encouraging colonization of virgin lands, rather than a wholesale redistribution of land.

Few books to date assemble the kind and quantity of information regarding the current Brazilian regime as does *Contemporary Brazil: Issues in Economic and Political Development*. The volume thus helps fill a significant gap in the literature. From another perspective, however, the book's strength may be considered a weakness, in that it is not very concerned with elaborating or testing generalizations about civil-military relations, political change, or other

topics of interest to students of comparative politics. I would therefore recommend the volume mainly to persons specifically interested in the politics and economic development of post-1964 Brazil.

SUSAN KAUFMAN PURCELL

University of California, Los Angeles

The Collective Farm in Soviet Agriculture. By Robert C. Stuart. (Lexington, Mass.: D. C. Heath and Company, 1972. Pp. xx, 254. \$12.50.)

Stuart describes his monograph aptly as "an in-depth analysis of the structural and operational characteristics of the Soviet collective farm as a mechanism for the organization of economic activity in the countryside" (p. 9). Although he elsewhere alludes to the development role of the kolkhoz (pp. 4-5), the fact that his study focuses upon the period since 1950 deprives it of significance on this controversial question. Rather, Stuart's study throws light upon the attempts of Stalin's heirs to convert the kolkhoz into a viable organization for the production and expansion of agricultural output. This involves examination of the general institutional and operational characteristics of the kolkhoz and an appraisal of the various structural and other reforms of the last two decades. Soviet leadership will find little comfort in the conclusions so obtained, but Stuart's careful sifting of organizational facts and features does go a long way toward explaining why the economic performance of the kolkhoz continues to disappoint reformers.

Chapters 2-4 are devoted to a consideration of the main changes that have taken place in the structure of the kolkhoz itself and in the administrative units with which it has contact. The amalgamation campaign of the early 1950s greatly expanded the duties of the kolkhoz chairman. Internal subunits, particularly the brigade, grew commensurately. The increase in size, coupled with abolition of the Machine Tractor Station system in 1958, led to a qualitative transformation of the production brigade, which has gradually become a permanent and multiproduct farm in its own right. Consequently, the production brigade of today is essentially comparable to the pre-amalgamation kolkhoz, and contemporary reports on the improved educational and other attainments of kolkhoz chairmen are therefore almost completely beside the point. Moreover, the increased degree of centralization of decision making implied by amalgamation has apparently offset the effect of decentralization elsewhere in the system.

All of this is, of course, well known, but it sets the stage for what Stuart has to contribute that is both new and significant in Chapters 5-7. Despite substantial improvements since 1950, the managerial incentive system for farm chairmen remains sadly inadequate. Although generally consistent with the goals set for farm managers, the incentive system has been undermined by excessive complexity and by the relatively small magnitude and the infrequent and inappropriate forms of premia payments.

Interestingly enough, however, Stuart goes on to demonstrate in Chapter 6 that "the kolkhoz manager has typically had very little effective control over production decisions" (p. 135). Inputs and outputs have ordinarily been planned from above with little regard for any expertise the chairman may have and with little room for modification at the farm level. Thus the ineffectiveness of the system of managerial incentives would not appear to matter very much, unless this kind of petty tutelage is expected to diminish, and Stuart considers this an unlikely outcome in the near future.

The introduction of *khozraschet*, i.e., cost and income accounting and planning, in the kolkhoz sector in the late 1950s, and the general upward revision of state agricultural procurement prices are considered in Chapter 7. Laudable as these changes may have been, the contemporary system still does not provide a suitable framework within which the chairman might be allowed to exercise economic discretion over the composition of inputs and outputs. Costing methods are too primitive, and relative prices are not consistent with the proportions specified for planned deliveries. Stuart quite rightly seeks to disabuse Western specialists of the notion that these reforms foreshadow the development of a variant of market socialism in Soviet agriculture.

Chapter 8, describing the characteristics of the contemporary kolkhoz chairman, is something of a digression. Stuart sees in the recent past a "continuing effort to create a 'professional' kolkhoz manager—a rural counterpart of the industrial plant manager" (p. 186). But how does this square with the preceding chapters? Why the emphasis upon the recruitment of professional managers when the incentive system is known to be too inadequate to ensure appropriate decision making and when the price and costing systems are too irrational to serve as appropriate guides to managerial discretion anyway? And, to top it off, the kolkhoz manager in any case apparently has little actual discretion to exercise.

Presumably, however, the good, "profes-

sional" manager is one who follows the plan as formulated by higher agencies, whether or not he finds it to his, or the farm's, pecuniary interest. The conversion from physical-volume targets and costing methods to ruble-value magnitudes has been, it would seem, for the benefit of the planning bureaucracy, and is not preliminary to an expansion of managerial authority.

Stuart's study is, then, quite useful in helping us to understand why the seemingly thoroughgoing reforms of the post-Stalin period have proved so disappointing in practice. The reforms have been neither sufficiently substantial nor sufficiently consistent to produce results. Unfortunately, Stuart fails, even in his concluding chapter, to put all the pieces together for the reader, and he consistently hedges his conclusions. A great deal that is presented is indeed new and interesting, but much is not. The book is full of superfluous tables, and non-economists will find an excess of economic jargon. Stuart's persistent and frequent use of the term monetization as a synonym for pecuniarization will irritate some economists as well. In short, the book would have benefited greatly from better general editorship.

JAMES R. MILLAR

University of Illinois

The Political Economy of Underdevelopment.

By Tamás Szentes. (Budapest: Akadémiai Kiadó, 1971. Pp. 328. No price indicated.)

This publication of the Hungarian Academy of Sciences is best viewed in two contexts: as a contribution to the global literature on "underdevelopment," its cause and cure; and as an explicit effort to devise a new and more sophisticated Communist propaganda approach to the developing nations.

Part One reviews the Western literature on development under six headings: the classification of nations on the basis of statistical indexes of GNP per capita and other indicators of degree of progress; the definition of underdevelopment in terms of specific characteristics of backwardness vis-à-vis more industrialized societies; models of underdevelopment as vicious circles or low-level equilibrium traps; sociological and psychological explanations of underdevelopment, including, especially, the problem of dualism; stages of growth analysis; and external inhibitions on development. Mr. Szentes has obviously read this literature and enjoyed it, and he does battle against its believed inadequacies with respect and relish in its subtleties.

His analytic argument is that: (1) the statistics conceal "qualitative" differences, related to

the position of the underdeveloped countries in the world economy; (2) the characteristics of relative backwardness are symptoms or consequences of deeper forces at work; (3) arguments in terms of vicious circles and low-level traps lack historical perspective and explanation, as do the sociological and psychological explanations; (4) stages of growth analysis lacks an explanation for the first case (Britain), underestimates the problems imposed on late-comers, and, because capitalist countries initially experienced high mass-consumption, tends to "idealize capitalism"; (5) analyses of the negative effects of the international environment are "the most valuable part" of the literature on underdevelopment, but they suffer because they regard these effects as "relative and transitory" or the result of "internal deficiencies."

At last (p. 127) the ground is cleared for Mr. Szentes' positive contribution to the debate, entitled "The Causes, Substance, and Laws of Motion of Underdevelopment. A Historical-Analytical Approach." In the following hundred and fifty pages the author argues that the essence of the plight of the underdeveloped countries is that they entered the world economy as suppliers of foodstuffs and raw materials to more advanced nations; that this relationship was economically disadvantageous as compared to a more "natural" path of development (presumably via industrialization); that it led to economies and societies that were dualistic as well as dependent; and that this dependence has continued after their political independence was gained.

Viewed as a piece of historical analysis, this important section of Mr. Szentes' book seemed to me quite unoriginal and incomplete. After all, it was Alexander Hamilton in 1791, in a postcolonial nation, who first said: "Not only the wealth but the independence and security of a country appear to be materially connected with the prosperity of manufactures." And a century earlier, the British were just emerging from a sense of quasi-colonial dependence on the Dutch. The pre-1914 story of nations as different as Sweden and post-Meiji Japan (initially forbidden protective tariffs), post-1815 Germany and Czarist Russia after 1861, Canada and the Mexico that exploded into revolution in 1910, is shot through with the struggle to build an industrial, financial, and trading base which would substitute for unequal dependencies new relations of dignified interdependence with an external world dominated by those who had achieved earlier take-offs.

Mr. Szentes' analysis of the contemporary

world has a similar static cast and a certain parochialism as well. He has spent some time teaching at the University College, Dar es Salaam. Many of his specific references are to Tanzania; and many of his observations about the contemporary developing world relate to African situations. On the other hand, he lapses over easily into sweeping generalizations about the third world as a whole, and his language tends to become both opaque and liturgically Marxist (e.g., pp. 142-7). One would never know from these passages of the extent to which overcoming the initial distortions that go with excessive dependence on the export of foodstuffs and raw materials has, for a generation and more, been an explicit object of regional and international policy in Latin America; of the successes in diversification and industrialization achieved in, say, Mexico, Venezuela, Colombia, and Brazil; of the purposeful efforts to use resources derived from oil exports to mount a wide-based industrialization program (and a successful land reform) in Iran; of the rapid movement towards diversified industrial exports in South Korea, Taiwan, Singapore, etc.

Thus, Mr. Szentes' desire to assert one proposition renders his analysis of the contemporary developing nations excessively unvariegated, and, quite often, misleading. His central proposition is that their key problem is not their own incomplete domestic modernization but the patterns imposed on their economic, social, and political life by their quasi-colonial relations with the external world.

This is the proposition Mr. Szentes believes he needs for the doctrine contained in his concluding section: "Prospects for the Overcoming of Underdevelopment. Summary and Conclusions." He first considers the prospects for world revolution and the overthrow of capitalism or for a collapse of capitalism. He judges these possibilities sufficiently unlikely to commend national efforts to overcome underdevelopment. His recommendations are: "to break the monopolistic position of foreign capital"; and "to transform the distorted structure of the economy and society." To achieve these ends, his sovereign remedy is: increase the power of the state to intervene in the economy. Here the author confronts the fact that the powers of the state in contemporary developing nations are generally large, and already directed to many objectives he commended in the previous portion of his book. In fact, his central problem becomes: What will be the fate of the "state capitalism" already endemic in the nations of the developing world. He cites, in particular,

India, Egypt, and Brazil. Mr. Szentes' formal bias is that they convert themselves into fully fledged socialist states; but his analysis of the prospects for this conversion is not particularly sanguine, and his final plea is for the liquidation of underdevelopment "in the shortest possible time," rather than a call for Communist revolution.

Behind this argument is the author's conviction that Communist analysis and propaganda (p. 19) "simplified the critique of colonialism by investigating it from a one-sided point of view and evaluated the problem of colonial liberation merely from the aspect of the 'reserves' of the socialist revolution. Moreover, it took proletarian revolutions as *direct* preconditions for the liberation of the colonies and regarded their further post-colonial development as the natural and necessary repetition (i.e., imitation) of the pattern of development of the first socialist countries in all details." His creed in this volume is (p. 21): "The criticism of colonialism must . . . be made more dialectical and realistic, thereby becoming more effective and more faithful to the Marxist-Leninist concept." His operational conclusion in this domain is: the most realistic (but not certain) route to communism in the developing world is through state capitalism.

Mr. Szentes' book is interesting as the product of a period when the osmotic communications between East and West greatly increased and the fate of Asia, the Middle East, Africa, and Latin America moved to the center of world politics. I do not believe this study adds anything of substance to our knowledge of the development problems and prospects in these regions. It does tell us a good deal about an intelligent Hungarian's struggle to link his study of development problems and his insights into East Africa to the structure and objectives of Marxist-Leninist thought and to the purposes of Communist propaganda.

The University of Texas at Austin

The May Thirteenth Incident and Democracy in Malaysia. By Goh Cheng Teik. (Kuala Lumpur: Oxford University Press, 1971. Pp. 76. \$2.50.)

As a basis for his discussion the author cites Carl J. Friedrich's notion of democracy that *the people* is the only source of legitimate authority (p. 1) and then establishes that a state is democratic when it satisfies two requirements: (1) its authority is derived from *the people* and (2) its power is exercised with restraint (p. 2). The author then states categori-

cally at the opening of Chapter 2 that "for six years [he does not say which six years] democracy was a living reality in the Malaysia Federation" (p. 9). In this same chapter the author reviews Malaysia's political history from 1955 to 1969 and concludes with the observation that the United Malays National Organization (U.M.N.O.) was disenchanted not merely about the outcome of the 1969 election but with democracy itself (p. 17).

Chapter 3 gives an account of the events leading to the 1969 racial riots; the twelve pages of Chapter 4, the largest of the six chapters, deal with unrest within the Alliance, the National Operations Council (N.O.C.) emergency government, the resumption of the elections in Sabah and Sarawak, the results of these elections and the conditions under which the federal parliament would be reopened.

In Chapters 5 and 6, entitled "Democracy and Political Stability I and II," and consisting of slightly more than six pages, one would expect an exposition of democracy in Malaysia. But apart from a spattering of references to democracy, they seem to be no more than a summary, with conclusions, of the foregoing chapters. The author speaks of the 1957 racial pact, the disturbance of the 1957 democratic equilibrium in May 1969, and the call for voluntary restraints on the part of the non-Malays (but not of the Malays), the possibility of change in the power structure in Kuala Lumpur, and the risk of a social revolution in the absence of serious party competition.

The author draws a forced parallel between the Malays and the non-Malays of Malaysia on one hand and the Javanese and the non-Javanese of Indonesia on the other; he claims (without any authority) that Sukarno had remarked "that the first three presidents of Indonesia should be Javanese so that the Javanese can have sufficient time to mature politically and to become fully Indonesian and to accept the non-Javanese minorities as equals" (pp. 40-41). In making this claim, the author seems to have overlooked the facts that (1) the Javanese and the non-Javanese of Indonesia belong to the Malay race, whereas the Malays, the Chinese, and the Indians of Malaysia belong to three different races which make the problems of the two countries basically different; and (2) the Javanese had always been at the forefront of Indonesian national and political movements. Therefore, to speak of the necessity of the first three Indonesian Presidents being Javanese so that the Javanese could fully become Indonesians is a rather pathetic attempt to project onto Indonesia one of Malaysia's ba-

sic problems, i.e., the reluctance of Malaysia's Malays, Chinese, and Indians to become fully Malaysians. Malaysia is in the unfortunate position of never having known a public act of commitment comparable to Indonesia's *Sumpah Pemuda* (Vow of Youth) of October, 1928 in Djakarta, at which Javanese and non-Javanese alike declared that there was one nation: *Bangsa Indonesia*, one language: *Bahasa Indonesia*, and one country: *Negara Indonesia*.

More remarkable, however, is the author's failure to define who constituted or constitute "the people" as the source of authority which in turn would determine the kind of democracy in Malaysia. The author makes no mention of the fact that the Malaysia Constitution looks differently at the three major racial communities of Malaysia (Malaysia Constitution, Part III) for the purpose of citizenship as the prerequisite to authority. He also speaks of a "check-and-balance mechanism" within the Alliance Party in the exercise of power (p. 4) without ever saying what this check-and-balance mechanism is. The truth is that the Alliance is a Malay-dominated party and that the U.M.N.O. is determined to see to it that "political power in the country would remain in the hands of the Malays as sure as the sun and moon would rise" (Tunku Abdul Rahman as Prime Minister of Malaysia in *Straits Times*, May 21, 1969).

The remaining 30 pages of the book are devoted to valuable data on Malaysia's political parties, major Malaysian party personalities, and some results of the 1969 election.

The book is useful as a reading on the national disaster of May 13, 1969, but as a discourse on democracy in Malaysia it is a disappointment.

University of Sydney, Australia

The Greek Tragedy. By Constantine Tsoucalas. (Baltimore: Penguin Books, 1969. Pp. 208. \$1.45, paper.)

Greece Under Military Rule. Edited by Richard Clogg and George Yannopoulos. (New York: Basic Books, 1972. Pp. 272. \$8.95.)

Most writing on modern Greece since the coup falls into three categories—analyses of antecedent conditions, accounts by disenfranchised public figures, and policy evaluations. Of the books reviewed here, *The Greek Tragedy* remains a good example of the first category and the essays in *Greece Under Military Rule* range across all three.

Explanations for the breakdown of Greek

democracy abound, and three views are represented here. George Zaharopoulos in *Greece Under Military Rule* argues that cultural deficiencies inhibiting the development of modern parties left a vacuum eventually filled by a highly organized military. C. H. Woodhouse, in another essay in the same volume, blames the ragged temperament of George Papandreou and the imprudence of the King. Constantine Tsoucalas, in *The Greek Tragedy*, examining events through the lenses of class conflict, suggests that vested interests linked to the United States were mainly responsible. These vested interests, sometimes called the ruling class, sometimes the oligarchy, are given key roles without evidence of boundary or cohesion. The place of the military in this lexicon is obscure. Fortunately, obvious lapses from the class model are explained in terms of personality clashes or concepts such as clientelism.

Despite conceptual flaws, *The Greek Tragedy* is an important book. First, the analysis of the collapse of the parliamentary regime presented by Professor Tsoucalas is widely accepted in Greece and elsewhere. Second, this is the first adequate Marxist interpretation of modern Greek history readily available to the American reader.

The earliest chapters are informative, but the best section traces the complexities, both domestic and international, of the resistance, liberation, and civil war and analyzes their postwar consequences. The last chapters are more troublesome. Postwar economic policy is criticized on a variety of grounds, along with a tacit admission that available policy instruments limited most alternatives. Although Tsoucalas provides an acceptable version of the dual authority—the competition between the military and civilians—his arguments that a secret society was the directing force in the military and acted as a surrogate for the Americans lack plausibility. Moreover, the claims that peasants, workers, and the new middle class were responsible for the electoral successes of the Papandreous would be more convincing with empirical support.

The remaining essays in *Greece Under Military Rule* are primarily concerned with policy evaluation—the essays cover a wide range of foreign and domestic policies. Despite the underlying assumption that the major goal of the regime is self-perpetuation, readers will join the editors in lamenting the lack of an essay on the institutionalization of power. Because of this lack, the chapters on ideology and regime opposition seem strangely incomplete.

The chapters on domestic policy conclude that the regime is retrogressive. The policy

changes and variations are not judged against the same benchmarks: Instead the criteria used are the Karamanlis period or part of it, the Papandreou government, the 1965-67 interlude, and the conditions that might have existed had the colonels not acted. Sometimes the comparison is with other military regimes, developed western countries, or ideal types. To compound the problem, time dimensions are muddled, and often policy pronouncements are taken as equivalent to action.

John Pasmazoglou, the distinguished economist, contributes the most balanced chapter. He notes that national income and the standard of living has risen but at a slower rate and with a widening gap between the advantaged and disadvantaged. This growth, he says, is the result of prior economic policy—monetary stabilization and various developmental mechanisms. To the extent that the colonels have an economic policy, it seems ad hoc. Although some alterations in tax rates and in budget allocations can be attributed to the necessity of gaining the support of the business community or retaining that of the military, other populist measures such as free textbooks or debt cancellations had been planned long before, and the emphasis on small local public works may simply indicate the lack of resources for larger ones.

In a chapter on labor, Yannopoulos notes that wage increases have lagged despite higher productivity. He attributes this to government control of trade unions. The regime is undoubtedly hostile to organizations generally, but unions and cooperatives have usually been viewed as political instruments in Greece. Many citations of "repressive" regulations suggest little knowledge of other economic or industrial relations systems. Curiously, Yannopoulos notes that government plans for changes in the social security system, working hours, and job tenure, have been stymied by pressures from interested parties, but he and other essayists still conclude that the government is essentially unrestrained.

The writer on education (who apparently insisted on remaining anonymous) suggests that past practices are continued. That is, there is still little in the way of a comprehensive and coherent national educational policy. Changes in funding, enrollment requirements, the consolidation of local systems, the level of direct involvement in the university, or in curriculum—including the return to *katharevousa* (the conflict between this purist form based on classic Greek and the demotic or popularly spoken Greek has been endemic in modern Greek history)—seem to be automatic reactions to

policies of past regimes or the elaboration of decisions "in the pipeline" prior to the coup. In either case, decisions are hardly immutable. Increased enrollment at all levels is apparently simply a function of demographic change.

An essay on culture notes that domestic literature directly attacking the regime has a precarious existence—the rest, including freely circulating foreign publications is ignored. Intellectuals, because of their elitist attitudes (unintentionally demonstrated by the author, Rodios Roufos in his caustic comments on popular television programming and the emphasis on sports) are unlikely to attract a popular following.

A. G. Xydis outlines the diplomatic isolation of the regime on the one hand and the flourishing commercial and tourist activities on the other. Ultrnationalism at home is not manifested in aggressive foreign policies; indeed, the reverse seems to be the case, especially with Turkey and Albania. Maurice Goldbloom argues that recent American policy has been guided by decisions made prior to the coup or altered because of changes in the conditions underlying the original decisions rather than by the character of the regime itself. The colonels, by initiating the coup and eliminating their rivals, left the United States with a dilemma—what to do about a state whose government was distasteful but which nonetheless performed as a loyal NATO partner.

Richard Clogg in his discussion of ideology supports the general conclusions of the policy chapters—that the regime operates without benefit of any coherent ideology despite an early populist stance. Unfortunately, Clogg and his associates miss an opportunity to integrate their own observations. Much of their analysis suggests parallels to authoritarian regimes elsewhere: a populist flavor which does not require the elimination of privilege—only the presumption of equal access, anti-intellectualism with emphasis on primordial values of church and nation, as well as a general depoliticization.

Despite the claims of regressive policies and heavy-handed implementation, George Yannopoulos finds little active opposition to the regime, and he attributes this to the ideological crisis of the opposition. Clientelist parties have disintegrated, the communists are severely fragmented, and the population, discounting the traditionally passive peasantry, is exhausted from prior years of political mobilization. The resistance reflects this fragmentation and popular exhaustion and faces a regime supported by the army, economic oligarchs, and the United States.

Regardless of the preferences and intentions

of the authors, these volumes suggest that the present regime in Greece is likely to persist. It follows that the present renewed interest by political scientists in the nature of authoritarian regimes is well timed.

KEITH R. LEGG

University of Florida

Politics in a Plural Society: A Study of Non-communal Political Parties in West Malaysia.

By R. K. Vasil. (Kuala Lumpur: Oxford University Press, 1971. Pp. xii, 338. \$13.50.)

As the contents of R. K. Vasil's book amply display, the subtitle describing this study as one of noncommunal parties may be rather inaccurate. No political organization in postindependence Malaysia has long been able to maintain a noncommunal character. The pressures of communalism have been such that no party entering the electoral lists has been able to co-opt large numbers of voters from all three major racial groups—Malay, Chinese and Indian—with the exception of the dominant Alliance organization. While parties such as the Independence of Malaya Party and Labour Party may have been born with high hopes of gaining adherents from more than one community, their membership soon became almost exclusively Chinese or Malay. In addition, their programs and goals appealed more and more to the needs and demands of their communal clientele.

In this interesting and detailed political history the author has described the birth, development, and, all too often, demise of the Independence of Malaya Party, Party Negara, Labour Party, Party Raayat, People's Progressive Party, and United Democratic Party along with what are described as "non-communal parties of personage," such as Abdul Aziz Ishak's National Convention Party. In each case he details the origins, policies, electoral programs and results, leadership, membership, and organizational structure of the party. It should be noted that the field research for this study was carried out primarily in 1964 and 1965 and the body of the work was completed by 1967. Thus, the analyses and descriptions are generally applicable to the middle 1960s. A postscript assesses developments to mid-1969. While the author's analyses and conclusions as of the completion of his initial writing in 1967 have not been seriously challenged by later events, it would have been more desirable if he had incorporated the post-1967 data into the body of the text, which would have given more coherence to individual chapters.

As a rule the author is objective and nonpartisan in his analyses, although he does have a

tendency toward overstatement, as, for example, in his comments that the rout of the Labour Party in the 1964 general elections "was entirely due to its stand on Malaysia and Indonesian confrontation" (p. 151), and that the voting of 1964 "was clear evidence of the complete lack of confidence on the part of the non-Malay communities in their communal organization, the MCA and the MIC" (p. 309). As a final minor note of criticism, additional comparative analysis with other communally-oriented political systems would have been welcomed. Thus, comparisons with countries such as India, Lebanon, and Nigeria might have provided useful insights.

There can be no quarrel with Vasil's central conclusion that in Western Malaysia noncommunal parties have been fated to develop into spokesmen for one of the two major communities, the Malays or the Chinese. The UMNO has been successful in characterizing itself to the Malay community as the defender of Malay rights, and anti-Alliance Malays who have joined with representatives of other communal groups have been politically ostracized as traitors to their people. This has meant that organizations such as the Labour Party, which began with hopes of uniting the Chinese and Malays, ultimately became Chinese in membership, goals, and policies. At the same time ideologically oriented Malay parties such as the Party Raayat were unable to expand their membership against the UMNO. Only the regionally based Islamic extremist Pan Malayan Islamic Party, not described in this book for obvious reasons, has been able to effectively challenge the UMNO by promoting highly communal Malay-Moslem programs.

Overall, this is a solid piece of political history. The author has incorporated material from newspapers, government and party documents, interviews with party leaders and members, and visits to party meetings. Despite the gaps occurring because of the period in which field research was completed and despite the occasional tendency to overstate conclusions, this book is a useful addition to both the study of party systems and Malaysian studies.

FRED R. VON DER MEHDEN

Rice University

Patrimonialism and Political Change in the Congo. By Jean-Claude Willame. (Stanford: Stanford University Press, 1972. Pp. xii, 223. \$8.50.)

Eight years ago in his *Politics in the Congo* Crawford Young identified the "primary challenge" then facing the student of Congolese

politics as involving "the basic task of providing a conceptual framework adequate to order the mass of disparate data available" (p. 607). Willame's work is the first serious attempt to pick up the gauntlet. Armed with a conceptual apparatus borrowed from Max Weber the author manages to achieve what most other students of Zairian politics have thus far consistently (and prudently) declined to try—that is, to impart coherence and intelligibility to the seeming chaos and confusion of Congolese politics.

To the all-too-prevalent views of Zairian politics as a game without rules *Patrimonialism and Political Change in the Congo* offers an important corrective. "Patrimonialism" is the name of the game. The rules, as specified by Weber, are essentially three: (1) the appropriation of public office by the elite, (2) the privatization of political relationships, in turn leading to political and territorial fragmentation, and (3) the utilization of private armies and mercenaries by patrimonial rulers. Analysis of these processes of change is skillfully combined with a series of diachronic perspectives to demonstrate the inherent frailty of patrimonial rule. The author shows in considerable detail how the massive absorption of economic and financial resources accompanying the appropriation of bureaucratic sinecures by petty functionaries led to a "wholesale waste" of human energies and economic wealth; how the privatization of political relationships tended to generate powerful centrifugal pressures, and how, with the emergence of private militias, territorial fragmentation reached an unprecedented scale, in time causing a breakdown of patrimonialism and a shift in the direction of a "Caesarist bureaucracy" (p. 129). Patrimonial politics, Willame concludes, "exacerbated personal antagonisms and centrifugal tendencies that neither governmental institutions nor the existing social structures could contain" (p. 160). Furthermore, by excluding from the spoils of appropriation specific social categories, patrimonialism sowed the seeds not only of its own destruction but of an alternative political system. What has come into existence is neither a praetorian nor a patrimonial polity but a Caesarist regime built on a tacit alliance among army men, students, technocrats, petty businessmen, and midlemen.

As anyone familiar with Willame's previous work on provincial politics in Zaire might have expected, *Patrimonialism and Political Change in the Congo* bears all the hallmarks of careful scholarship. The author's argument is, on the whole, convincing; his handling of the data

brought to bear on his analysis is appropriately selective and imaginative; the qualifiers he introduces are pertinent. The main question in this reviewer's mind is whether the projection of the Weberian concept of patrimonialism into the context of Zairian politics does not require more elaboration and adaptation than the author is willing to make. Without in any way denying the relevance of the patrimonial model to the phenomena discussed in the book, one nonetheless wonders whether its utility goes very far beyond that of a mere device for ordering data.

The limitations of the patrimonial model stem in part from the extreme vagueness of its conceptual referents. This is nowhere more painfully evident than in Willame's valiant efforts to distinguish among the different types of "patrimonial and cliental relations" in existence at the provincial level between 1962 and 1965, an effort which in retrospect seems to amount to little more than a taxonomic exercise. What does the notion of "appropriation of public office" tell us about Zairian politics that could not be conveyed through terms like "corruption," "interpersonal relations," or "clientelism"? What specific forms does the "privatization of political relationships" take in the provincial arenas, and how do they differ from the "privatization" observable at the center? The answers are anything but clear. Strange as it may seem in view of the author's first-hand acquaintance with provincial politics, the weakest part of his analysis is that which deals with patterns of patrimonial relationships at the local and provincial levels. Nowhere does one get a clear picture of the types of relationships involved in "direct suzerainty," "indirect suzerainty," and "factional comradeship," let alone of the linkages operating provincially and nationally.

Omission of the specific types of resources associated with evolving patterns of patrimonialism accounts for yet another limitation in Willame's model. If the appropriation of public office is undoubtedly an important aspect of patrimonialism, one is left to wonder what resources generate public office and what resources are in turn generated by it. Ethnicity, authority, wealth, coercion have all been instrumental in one way or another in generating political exchange, either as political currencies through which public office is acquired, or as political rewards for remaining in office. Yet relatively little effort is spent explaining when, where, and how these political resources were utilized by Zairian elites. Willame's neglect of political resources as an intervening variable also

helps to explain his tendency to overstress the difference between the Mobutu regime and its patrimonial predecessor. Appropriation of public office, the personalization of political relationships, the setting up of private militias are still very much part of Zairian politics. Where the Mobutu regime would seem to diverge most sharply from the previous one is in the overwhelming importance accorded to wealth, expertise and information, in this order, for acquiring, retaining and distributing authority. Mobutu's Caesarist bureaucracy is not so different in style from the patrimonial polity it has abolished. The critical difference lies in the manner in which political resources are handled, and in the sectors to which they are allocated.

In spite of these reservations, Willame's book deserves to be widely read by political scientists. Even though it promises more than it actually delivers, its contribution to our understanding of Zairian politics is a major one. Better than anyone else so far the author has managed to reduce to a rational framework much of the irrationality involved in Zairian politics. If, as the author modestly claims, this book is nothing more than "an unfinished product," one can only look forward to the promise of his completed work.

RENÉ LEMARCHAND

University of Florida

The Long March: The Epic of Chinese Communism's Survival, 1935. By Dick Wilson. (New York: The Viking Press, 1971. Pp. xx, 331. \$8.95.)

The Long March during which the Chinese Communists moved from their old Soviet stronghold in southeast Kiangsi to the Shenkan-ning Border Region was one of the great military feats of this century. Those who survived have ruled the Chinese Communist Party from 1935 until the present—thirty-seven long, tumultuous years. If any one event was responsible for the deep rift between the Chinese and Russian Communist Parties, the Long March was that event. Only three months after the March began in October 1934, Mao's supporters eliminated Otto Braun, the German Comintern advisor, and his Chinese supporters from their political and military positions in the leadership. At the Tsunyi Conference in January 1935, Mao himself took over as Chairman of the Revolutionary Military Council and Chairman of the Politburo.

The author, Dick Wilson, has been the director of the *Far Eastern Economic Review* and is now the financial editor of the *Straits Times* in Singapore. He summarizes in this book every-

thing that is known about the March. Using Chinese, English, and a scattering of German, Russian, French, and Japanese sources, he has put together the very best account of the Long March in English, and probably the best in any language. In Wilson's chronicle, the March is not only an epic of courage, idealism, and perseverance, but also the story of how the Maoist faction first gained control of the leading organs of the Chinese Communist Party. Almost everything that he records deals with the main force of the Red Army lead by Mao and Chu Teh. The epic of the other Red armies under the leadership of Hsü Hai-tung, Ho Lung and Chang Kao-t'ao are neglected here as they are in all Chinese sources. According to Wilson, the chief legacies of the Long March have been a stringent political and military discipline, a "guerrilla ethic" that links revolutionary ardor with reliance on the peasant masses, an independence from Russia based on a profound distrust of Comintern and Soviet advice, and, eventually, the consolidation of Mao's power within the CCP.

None of these outcomes, Wilson tells us, was planned; they grew out of the experience of those who survived the Long March. The survivors continued to build on that experience, first expanding their guerrilla bases behind Japanese lines, and then driving the Nationalists from the Chinese mainland. Of the 100,000 Chinese who began the retreat from Kiangsi, only 5,000 arrived at the base in North Shensi (p. 227). By the early 1960s, only 800 of that number were still active members of the CCP. Those who rule the CCP to this day were members of that select elite. They are the men who have guided China into the modern world.

For China scholars one of the most valuable bits of new information recorded in the book is Dr. Jerome Ch'en's list of all the twenty-eight Bolsheviks, the young, Russian-trained, proteges of Stalin who led the CCP from 1931 to 1935 (Fn. 15, p. 296). In any book using so many Chinese names, American proofreaders fight a losing battle trying to get every Chinese name correct. One error that struck my eye occurs in p. xi: The *kuo-yü* spelling of Chiang Kai-shek is not Chiang Chung-cheng, but Chiang Chieh-shih. More important to me, the Tsunyi Conference was not the point at which "Chu Teh's superb generalship and Mao Tse-tung's political acumen united to turn victory into defeat" (as I am quoted as saying on p. 109). In my original sentence, defeat was turned into victory. Fortunately such errors are relatively infrequent.

This book will be read for a long time by

those who need a well-written summary of the significant military and political events that occurred on the Long March. Dick Wilson provides us with that, and with much more. This is a story of courage and endurance rarely matched since Xenophon wrote his account of the retreat of the Greeks from Persia to the Black Sea. When the Chinese Communists finally emerged from the wild grasslands of Chinghai and came upon genuine Chinese houses in Kansu, their joy can be likened to that of the Greeks when their vanguard saw the Black Sea and shouted, "Thalassa, thalassa" [The sea, the sea]. The remnants of the Red Army emerged from the Tibetan wilderness with a passionate attachment to the symbols of their homeland. They have made their experience a legend in their own lifetime. They have used the story of their ordeal as the prime inspiration for binding the Chinese people together in an attempt to achieve the good things offered by modern technology without sacrificing the idealism and cohesiveness that they once discovered in themselves, and that they attribute selectively to the best representatives of their Chinese and Marxist traditions.

JOHN E. RUE

Oakland University

Planning for Economic Growth in the Soviet Union, 1918-1932. By Eugene Zaleski. Translated from the French and edited by Marie-Christine MacAndrew and G. Warren Nutter. (Chapel Hill: The University of North Carolina Press, 1971. Pp. 454. \$15.75.)

This is a very useful book. It presents a detailed analysis of the formative period in which Soviet economic planning methods took shape. As a revised and amplified translation of the original 1962 French text, the present treatise involves two forewords, two prefaces, and seven chapters, followed by a substantial statistical appendix, a thorough bibliography, and a good index.

The central chapters describe the formation of the planning system and the adjustments that developed during the hectic years after 1928 when the targets of the first Soviet Five-Year Plan were being raised, lowered, or abandoned. Chapters 6 and 7 offer a thoughtful evaluation of Soviet planning and reflective conclusions on the implications of this experience for planning theory in general.

Political scientists as well as economists will find that this study makes a major contribution to the recent literature on a fundamental aspect of Soviet development. It should be consulted

along with the two-volume 1969 treatise of E. H. Carr and R. W. Davies, *Foundations of a Planned Economy 1926-1929*, Moshe Lewin's *Russian Peasants and Soviet Power* (1968), Alec Nove's *An Economic History of the USSR* (1969), and Naum Jasny's *Soviet Economists of the Twenties* (1972). These works together provide a new and more thorough basis for understanding Soviet experience than has been available from earlier writers like Maurice Dobb.

The central politicoeconomic issue raised by early Soviet economic planning concerns the forces that led to its excessive ambitiousness. Cautious economists were swept aside by fiery party leaders, and a style of planning took shape that has, in somewhat milder form, persisted ever since. A mystique of plan precision is associated in practice with ad hoc adjustments and widely divergent results.

During this first period, as shown in detail by Zaleski, the wildly excessive targets led to near chaos by 1932. (The forces at work in the background are the subject of an interdisciplinary debate in the June, 1973 issue of the *Slavic Review*.) During the second and later plan periods, the discrepancies between target and fulfillment decreased, but even now, during the ninth Five-Year-Plan period, revisions and infeasibilities are making their appearance.

Although more than 40 years have passed since this initial tumultuous era, its legacies are still evident in the USSR. The campaigns unleashed during the first Soviet Five-Year Plan period led to a sullen peasantry, a crippled agricultural sector, a long period of domestic terror, and a permanent setback for the idealistic international influence of communism. Moreover the approach to national economic planning that took institutional form under the first plan is still being used in spite of its defects. Thus the keys to current Soviet difficulties lie in the forces that were at work even during the 1920s. Hence the relevance of this volume.

Zaleski's treatise is useful in at least three ways. He provides a great deal of statistical detail in tables and graphs compiled from primary Soviet sources whose yellowed pages are fast crumbling away. He offers an objective review of the intricate administrative developments that were involved in the evolution of Soviet planning practice. In addition, he enlivens the discussion with the pungent insights of a thoughtful political economist.

One can quibble here and there with the English translation, but in only two places is the meaning of the original obscured. In discussing Lenin's April Theses at page 29, Zaleski is not

saying that the theses contained elaborate projects, but that these projects were worked out later to meet specific needs. In footnote 122 at page 190, he is warning the reader that "putting into operation" does not signify full utilization of capacity. The whole volume is impressive, however, for the general accuracy of the translation and the precision with which the immense tasks of data transcription, bibliographic referencing, transliteration, and proofreading have been handled.

Haverford College

The Conventions of Crisis: A Study in Diplomatic Management. By Coral Bell. (London: Oxford University Press, 1971. Pp. 131. \$3.75, paper.)

Professor Coral Bell has written a very useful and insightful (though not pathbreaking or revolutionary) essay on the occurrence and meaning of crises and techniques of crisis management in the current international system.

In the methodological terms of the present era her volume is an example of traditionalism *par excellence*; as the author herself remarks, "The results of a piece of crisis management can only be observed in history, not established by theory" (p. 6). Professor Bell both divorces herself from recent American scholarship and establishes her own implicit claim to a distinctive position in the study of crises. Most recent analyses of crises have centered on bureaucracy, but Professor Bell's principal interest is in output and outcome rather than input or process, and she therefore provides a different perspective: systemic in origin, comprehensive in scope. Though her methods are quite distinct, her approach is in many ways similar to that of Oran Young and even Charles McClelland.

A critical problem however lies in Professor Bell's definition of crisis—a definition which is consciously broad:

To my mind the essence of true crisis in any given relationship is that the conflicts within it rise to a level which threatens to transform the nature of the relationship. In adversary crisis, the potential transformation is from peace to war; in intramural crisis it is from alliance to rupture (p. 9).

This notion of a "breaking strain" in a relationship is an intriguing one, but since a good deal of international politics is about near-misses and relations almost but not quite broken, the author tends to treat most major events as crises. Characteristically, the Middle East and Southeast Asia are discussed as areas of "crisis

and potential crisis," which is very different from specific incidents like those that have occurred in Berlin and Cuba, which she also considers (chapter 6). Because the author talks of "slow-motion or cumulative crisis" (p. 95), the reader begins to feel what is being analyzed are transformations of international conventions rather than established techniques of crisis management. It is indeed the dual existence of these two critical issues—"turning points" and "boiling points" and Professor Bell's attempt to identify them—which stands as the singular weakness of her approach to the subject. A crisis in a relationship which comes close to war may be quite different from an experience which substantially alters attitudes and perceptions of participants toward each other. In the Cuban missile crisis the two seem to have coexisted, but this is not the case in such disparate crises as Berlin (1958–1961) and the Congo; the Bay of Pigs and the Pueblo crisis; Cyprus and Czechoslovakia—1968.

Despite some difficulty with the meaning of crisis, Professor Bell's distinction between intramural and adversary crises and their effects on international relations are both useful and generally applicable—as her later analysis amply demonstrates. Moreover, the notion of a "crisis slide" (pp. 14–15, i.e., a series of episodes which result ultimately in a deterioration of relations and finally war), though it is not entirely new, is functional and enables her to make an excellent comparison of the interwar and present periods. The author's major conclusion that the "early recognition of an adversary relationship is the most important single political difference between the postwar and interwar periods" (p. 21) seems both apt and accurate. Her Coser-like belief that the cold war represented "a learning curve in crisis management" (p. 24) sheds light not only on the dynamics of post-1945 international politics but on the reasons for breakdown in the earlier period as well.

The comparison between the interwar and postwar periods also reasserts the ongoing paradox of this volume; though it is a book about crises, its author places greater stress in her analysis on patterns of relations and attitudes and prevailing perceptions than on specific events themselves. The difference in her message from both bureaucratic and systems theorists is to stress the tentative nature of patterns. We are thereby led to the old Aristotelian imperative of prudence: "The assumption of rational behaviour is a condition for the growth of the system of conventions: it can be established only by communication between the

dominant powers" (p. 124). Professor Bell is then both diplomatically and methodologically traditional. Removed as she is from the political and theoretical debates in this country, she provides in this essay a helpful reminder that crises can be viewed as part of overall processes in international politics rather than only as dynamics of the domestic scene. It is unfortunate, however, that Professor Bell fails to take her major themes beyond the timid conclusion that "... if the society of states can learn to manage the crises, it may learn to live with the conflicts, even perhaps finding in them a source of moral and political development" (p. 124). This book therefore provides students of world politics with an example of the significance of comprehensive historical analysis in the understanding of the techniques and instruments for the control of international instability; but it fails to move beyond this level to suggest specifically the future role of crises, the means of dominant power communication, and the types of world order which might be achieved as a consequence of the author's analysis.

STEVEN L. SPIEGEL

University of California, Los Angeles

After Imperialism. By Michael Barratt Brown. Revised edition. (New York: Humanities Press, 1970. Pp. lviii, 535. \$13.50.)

The early 1960s brought not only the liquidation of much of the British Empire but also, as a last brief and brilliant afterglow, the publication of a number of superior books analyzing the Empire's causes and consequences. Works by Rupert Emerson, John Strachey, Ronald Robinson and John Gallagher, D. K. Fieldhouse, and E. J. Hobsbawm are the most familiar, but there are others. Together, they form a distinguished literature analyzing one of the most important institutions in the international relations of the past century.

It was, however, an institution of the *past* century, and in more normal times one would have expected these accounts of the British Empire to assume a sedate position on quiet library shelves, respected but unread, like those other splendid books on the causes and consequences of the Byzantine Empire.

That they did not is in part due to John Kennedy and Lyndon Johnson. For at the time that the British Empire came to an end and the books analyzing it came into print, the American military intervention in Indochina and the lesser interventions elsewhere were getting under way. It was not long before indirect rule through petty princes, imperial garrisons on remote frontiers, and corporate investments in

underdeveloped countries seemed much more relevant for comparative purposes than the alliances and diplomacy of even so recent a period as World War II, and books about the old British Empire made their appearance in new American college courses in international politics.

One such book was Michael Barratt Brown's *After Imperialism*. Originally published in Britain in 1963, it was less familiar than the works by the authors mentioned above, but in the course of the 1960s it enjoyed a growing and favorable reputation among scholars and students taking an economic approach or following a radical persuasion. It has now been reissued, with the addition of a new, lengthy, and informative preface, in which the author answers some of his critics and amends and updates some of his arguments.

Aside from the new preface and an introduction, the book is divided into three parts: "Imperialism As It Was," "Imperialism Today," and "Towards an International Economy." Because these sections were written in 1962 for a British public concerned with the issue of Britain's relations with the Commonwealth and with the Common Market, it is not surprising that the three parts will be of unequal interest to American political scientists reading it more than a decade later.

The first part, "Imperialism As It Was," is by far the most important. Brown's basic approach is a Marxian one, and his emphasis is on the economic causes and consequences of British imperialism, both in Britain and in the colonies. His account is unusually balanced, subtle, and informed. Included is a critique of the earlier economic analyses of Hobson and Lenin. As such, Brown offers an important interpretation of British imperialism to place alongside several different economic analyses as well as those analyses which stress strategic or bureaucratic causes.

The second part, "Imperialism Today," primarily offers an account of the foreign trade, finance, and investment patterns of Britain in the postwar period, especially in the 1950s. The emphasis is on the role of the major British corporations and is similar to Harry Magdoff's later analysis of the international role of American corporations. Not surprisingly, the details of this part are of little interest to a reader concerned with the British role today, but those who have an historical interest in this important transition period will find the section useful, especially if they balance it with more conventional analyses. The book also contains sev-

eral pages of useful statistics on the foreign trade and investments of Britain and other industrial powers.

In the third part, "Toward an International Economy," dealing with the issue of Britain's economic relations with other countries, Brown urges Britain not to enter the Common Market but to develop a socialist economic group based on the Commonwealth. In 1963, the choice between Common Market and Commonwealth, between capitalist and socialist paths, was an engaging topic of debate, made all the more interesting perhaps by de Gaulle's veto in January of that year. But a decade later, with Britain's entry into the Common Market at last accomplished, and with its ties to the Commonwealth almost extinguished, few debates are more dated. Even the Labour Party declined to follow a program such as Brown's when it had the chance and the choice from 1964 to 1970; it is unlikely to do so when it again gets into office. One weakness in Brown's book is that he never gave an account of how his program would come about, given the structure of British capitalism as he analyzed it.

And now, in 1973, the great recession of the British Empire seems to have divided in two, part going down the dingy alleys of Belfast, part down the shiny corridors of Brussels. It is hardly a splendid spectacle. Once, however, long ago and far away, it was otherwise. It is true, as Brown says, that the British Empire at its height exploited its peoples. So has every empire. Perhaps the factor that distinguishes one empire from another is not economics but esthetics. The British Empire may have impoverished some of its subjects. But the passing of a political institution that celebrated its power, not with PXs, USOMs, and B-52s, but with Georgian mansions, public parks, military bands, and dignified courts of law has impoverished some of us too.

JAMES R. KURTH

Swarthmore College

World Communication: Threat or Promise? A Socio-technical Approach. By Colin Cherry. (London: Wiley & Sons, Ltd., 1971. Pp. 229. \$9.50.)

If a student were going to read only one book on the subject of communication to learn what that field is all about, this would not be a bad choice.

The first part of the book analyzes the process of human communication, and then describes the communication revolution of the past two centuries, comparing ancient and modern modes of communication and docu-

menting the explosive growth of means of communication in the modern world. There follows an excellent treatment of the present network of international communications, and in particular the growth of telecommunication facilities. Among the social problems dealt with, in a communications context, are the gap between the advanced and developing countries, the formation of international and intercultural attitudes, and trends toward supranational organization.

The author is an engineer and student of linguistics, not a social scientist. His subject, the social impact of the communications revolution, requires him to command all of those fields and he does so well. A social scientist may have some parochial inclination to carp occasionally at deviations from the stigmata of social science professionalism. But probably no social scientist around could handle the technical material of this interdisciplinary area well enough to maintain Cherry's across-the-board level.

Such a comprehensive treatment is possible only in a book addressed to laymen, for attempts to be more technical in any one of the disciplines that go into this book would make it incomprehensible to practitioners of the other fields. What results is a readable, well-written statement for the nonspecialist (including, for example, a page explaining the use of the correlation coefficient).

It is an old saw that specialized disciplines learn more and more about less and less, and so it should be. If one contemplates the books and articles on communication by the most important recent social science practitioners of the field, such as Lazarsfeld, Hovland, Schramm, Klapper, Lerner, or even perhaps, Lasswell, one has to recognize that they have not made their main contributions when they treated communication as a total system. Rather they have clarified how some pieces of the process work; that is how science functions. The scholars whose writings have dealt with the communications process as a social whole, such as George Herbert Mead, Cooley, Innes, or Lippmann are in a more essayistic tradition. Cherry's book is of this latter genre, though it draws heavily on what science has learned.

World Communication is an erudite book. One learns a good deal here and there in it about the history of postal service, the etymology of various political words, and the development of the international organizations in the communication field.

It is also a sensible book that documents carefully the dramatic social and political

changes which the communications revolution has brought about in both developed and developing countries. It avoids flights of futuristic fantasy about where this revolution is leading. Cherry is hard on clichés about “a shrinking world” or about communication producing understanding.

Inevitably, however, in a book as comprehensive as this one, a few errors creep in. Cherry slips slightly in interpreting the Soviet distinction between agitation and propaganda. He also errs on Soviet jamming. He notes the inefficiency and costliness of jamming of foreign short wave broadcasts, and says it was dropped in 1963 and “not resumed” since. In fact, it was resumed during the invasion of Czechoslovakia and has continued ever since.

A few such slips do not prevent this book from being an excellent compilation of basic facts about the world communication system, with the facts set in a context of generally wise and humane judgments.

ITHIEL DE SOLA POOL

Massachusetts Institute of Technology

The People's Republic of China and the Law of Treaties. By Hungdah Chiu. (Cambridge, Mass.: Harvard University Press, 1972. Pp. 178. \$10.00.)

This study of China's doctrines and practice regarding the law of treaties is of great value to all concerned with the universality of international law beyond the current ideological divisions of the world. Focusing on Chinese treaty practice, Dr. Chiu sets out to examine to what extent the People's Republic of China (PRC) differs from, or agrees with, states in the West and in the Socialist camp. He also attempts to relate his findings to the 1969 Vienna Convention on the Law of Treaties, to which the PRC is not a party.

Chiu has made profuse use of a wide range of primary and secondary sources, including texts of treaties and agreements, other official documents, and writings by PRC jurists. The six chapters broadly cover most of the procedures and technicalities concerning treaty making, entry into force, validity, interpretation, suspension and termination, and the position of treaties in international and municipal law.

The PRC's treaty law and practices are not widely different from those of the West, Chiu concludes; but, “where differences do exist, they are profound” (p. 119). One such example is the Chinese attitudes toward “unequal treaties,” which hold that inequality created consequent upon a treaty vitiates the document's validity. Another example, Chiu adds, is

the perceived effect of revolutionary change of government upon the state's treaty obligations. He attributes these and other differences to China's past frustrating experience more than to its present ideology. More critical scholars might question whether Soviet influence, at least on the two questions just cited, is as insignificant as the book appears to suggest (p. 119). Others might also wish that the author had compared Peking's stand on “unequal treaties” with what the 1969 Vienna Convention has stipulated regarding the invalidity of treaties concluded under duress (Art. 51) and of treaties in conflict with a “new peremptory norm” that has since emerged in general international law (Art. 64)—such as, presumptively, the principle of sovereign equality codified in the Charter of the United Nations.

A better example in which Peking's current attitudes are traceable to those held by previous Chinese governments would be the PRC's stand on the doctrine of *rebus sic stantibus* (vital changes in circumstances). While the book devotes considerable length to the topic, it bears noting that China in 1926, then under a different government, had invoked changed circumstances in an attempt to abrogate an 1865 treaty with Belgium. The final settlement, however, was by the conclusion of a new treaty. The instance seems to have anticipated the present PRC position that whereas changed circumstances do not *ipso facto* obliterate a treaty, they provide legitimate grounds for renegotiation.

This particular position differs from that of the Soviet Union to the extent that the latter considers *rebus sic stantibus* a capitalist ploy to beg out of unpalatable treaty obligations. Nor is the PRC stand the same as the more predominant view in the West adopted in the 1969 Vienna Convention (Arts. 62, 65, and 66, and Annex), which relate changed circumstances to treaty termination, suspension, and withdrawal, as distinct from treaty revision. In its pronouncements on *rebus sic stantibus*, Peking has quite consistently maintained a distinction between treaty revision and treaty termination, between what is repudiable and what is repudiated, more especially in regard to treaties of cession and boundary delimitation (hence, the Sino-Soviet border talks). There seems to be some confusion on this point (pp. 102–103).

The newness of the field offers opportunity and challenge. But Dr. Chiu's work will stand on its merits, which are legion, and will take its proud place in the inchoate literature on China and international law. One might demur about his interpretations, such as whether the PRC

considers treaties "an important source" (p. 3) or "the most important source" (p. 5) of international law. But no one can deny the value of this timely monograph on a subject of growing importance. The book does not purport to be definitive nor to go beyond the legal dimension to a consideration of policy behind and underscoring treaty making. Hence, some of the omissions are quite understandable: among these is the lack of any extensive discussion of the Five Principles of Peaceful Coexistence, which are embodied in many of Peking's more important political treaties and held by its jurists as among the peremptory norms (*jus cogens*) of general international law.

The book is a well-researched and well-documented product of many years of intellectual drudgery, and it will add to the laurels of the Harvard Studies in East Asian Law directed by Jerome A. Cohen. The footnote section, the extensive bibliography, the Chinese-English glossary, and the appendices containing texts of selected treaties, are just as valuable as the main text, all executed with a meticulousness essential for serious scholarship.

JAMES C. HSIUNG

New York University

The Soviet Invasion of Czechoslovakia: Its Effects on Eastern Europe. Edited by E. J. Czerwinski and Jaroslav Piekalkiewicz. (New York: Praeger Publishers, 1972. Pp. 224. \$14.00.)

This is a collection of very brief, often superficial, often repetitious accounts of the Soviet invasion of Czechoslovakia in 1968. The ten contributors, all academicians, for the most part attempt to discover the impact of the occupation on its several environments—Czechoslovakia itself (Jaroslav Piekalkiewicz, Hana Benesova and Ivan Sviták); USSR (Roger E. Kanet); Hungary (Rudolph L. Tokes); Hungary and Poland (George Gomori); Romania (E. Bennett Warnstrom); Yugoslavia (Werner Sichel); and East European theater and drama (E. J. Czerwinski); in addition, Ivan Volgyes compares the Hungarian Revolution of 1956 with the 1968 Prague Spring. We are thus confronted with a *potpourri*, more suggestive of ready availability than of systematic insight, or even another catch-as-catch-can treatment of a hot topic.

But this may be too harsh a criticism. Why include other East European countries, for example, if their cases are less interesting than those discussed? Or why treat the topic on several levels of analysis, or for East Europe as a whole, for that matter, if a significant key is provided via the chapter on East European the-

ater and drama? In their introduction, the editors point out that the contributors "represent various ideologies and points of view," . . . "uniformity of opinion is notably absent," . . . and . . . "this is as it should be" (p. x).

Whether it should or should not, it is not the case in this compilation. Here various ideologies do not necessarily mean various points of view. Ivan Sviták, for example, member of the Czechoslovak Communist Party since World War II, lost his good standing only lately when his point of view became similar to those now contributing to the volume. And if uniformity of opinion means that all the authors agree that the Soviet invasion was a bad thing, then the book is certainly uniform.

As to quality, insight, and innovation, the contributions vary. Jaroslav Piekalkiewicz's chapter on surveys of public opinion in Czechoslovakia before and after the invasion provides solid evidence that there was no counter-revolution there. Far-reaching reform, yes; revolution, no. The Communist party under Dubček would have won in a free and democratic election because it would have been the popular—not an elitist—organization. Hana Benesova contributed a useful description of the important influence of Czechoslovak writers on the sequence of events. Ivan Sviták, in two chapters, spins his customary grandiloquent and decisive views on the cosmic consequences of the occupation, ready as always to digress on all kinds of significant though not necessarily related topics at the faintest suggestion. Reading him is getting tedious—he has said many of these things before, and equally vehemently and in an equally grand style. Without new research, I fear, he may get bogged down in banalities. Roger Kanet's chapter on Soviet foreign policy is informative, though not as profound as his other writings. George Gomori's comparison of Hungarian and Polish attitudes is insightful and well-researched. Ivan Volgyes offers a useful comparison of the similarities and differences between 1956 Hungary and 1968 Czechoslovakia. But how important are the similarities and differences for the dynamic process and its outcome? What we need are tight, parsimonious assessments, rank orderings and causal correlations: We have by now too many "first steps" in the right direction but few follow-ups. Rudolf L. Tokes's essay on the reactions of Hungarian intellectuals is refreshing and careful. E. Bennett Warnstrom's otherwise perceptive study of Romanian reaction is incomplete and even obsolete because there is no evaluation of post-1969 developments. Werner Sichel's chapter on the effects on Yugoslavia is solid, systematic, and revealing. And E. J.

Czerwinski's evaluation of the effects on theater and drama in Eastern Europe is both articulate and professional. Professor Czerwinski convincingly shows how important are the insights that can be gathered from an East European intellectual mainstream such as theater and drama.

Taken as a whole, the volume is inadequate for two principal reasons: one, lack of intellectual direction by the editors; and two, the brevity of the individual contributions. The editors, in my opinion, fail to make the book a coherent whole. Apparently their instructions to the contributors were minimal, and this shows throughout the book. Moreover, the reader looks in vain for a chapter bringing the scattered observations of the several authors together in an overall, meaningful analysis of the "effects on Eastern Europe." What does it all, indeed, amount to? And the excessive brevity of most of the contributions results in superficial treatment of the respective subjects (exceptions are Piekalkiewicz and Sichel).

Still, the effort should not be discarded as wasteful. I, for one, find it useful to have several postinvasion cuts across the several environments discussed here. The principal value of this heterogeneous volume is indeed historical. The several country profiles, changed or changing since they were frozen in the individual chapters, may be fruitfully compared with the subsequent developments for a longer-range analysis. And here, I submit, rests the heuristic saving grace of the book. I would like to return to it five years from now.

JAN F. TRISKA

Stanford University

International Law, National Tribunals, and the Rights of Aliens. By Frank Dawson and Ivan L. Head with the collaboration of Peter E. Herzog. (Syracuse, N.Y.: Syracuse University Press, 1971. Pp. xviii, 334. \$11.75.)

In his foreword to this timely and informative book, Professor Richard Lillich suggests (p. vii) that no published work to date has attempted to do what this volume sets out to accomplish. The book is the product of fieldwork in twenty-five countries, funded by a Ford Foundation grant. One of the authors, formerly a practicing lawyer in New York and Caracas, is an investment banker in London; the other is a professor of law at Syracuse University. They acknowledge in their preface the assistance of practitioners, government officials, businessmen and scholars in the countries visited.

An introductory chapter examines the idea of injuring a state through its nationals, submitting (p. 23) that foreign offices have been more

important than national or international tribunals.

A chapter on "The Challenge of New Perspectives After 1945" notes that the European Commission on Human Rights is an indirect means by which a private party's grievance can be brought to the attention of an international body (p. 30). Powerful states are regarded as less able to intervene in the affairs of weaker states to secure compliance with international law, and the concept of sovereign equality takes on a "new vitality" as a result of the nuclear stalemate (p. 44).

Developing practice in the Commonwealth receives particular attention. Despite the Judicial Committee of the Privy Council's ceasing to be the final court of appeal for many Commonwealth countries, the authors discern a common measure of attitude toward aliens (pp. 62-63), and British forms are said to be used in thirty-one countries (p. 73). The study notes that extraordinary judicial remedies are available in Commonwealth states which have a common-law heritage (p. 90), and that constitutions in Western Europe "quite generally provide that the judiciary shall be . . . subject only to law" (p. 101). The authors advocate that alien investors in developing countries pursue their claims against both governments and individuals through legal channels (p. 105).

An instructive chapter notes that most nations allow aliens access to tribunals on a basis of equality, mentions theories that are applicable (p. 109), and points out some historical variance that has evolved over centuries (p. 157). A following chapter notes that, if one party in litigation is from a civil-law country and the other from a state in which the common law is basic, some rules may seriously affect the conduct of the litigation (pp. 159ff). The authors maintain that even in the United States there are problems about delayed litigation, and they refer (p. 175) to the United States policy of not espousing claims against other states unless there is claimed violation of international law.

Assistance requested between the courts of two sovereign states normally presents problems that may be treated differently in applicable treaties and legislation. Summarizing, the authors submit that "the structural procedural problems discussed in this Chapter and in its predecessors . . . may become increasingly complicated when an alien seeks to bring suit against his host government . . ." (p. 192).

As to the theoretical capacity of nationals and aliens to sue, the authors note, in a chapter on "Protection against Governmental Action," that this recourse has been hindered by the

concept of sovereign immunity; United States statutes permit an alien to sue if he can show that United States citizens are permitted to sue in the courts of the alien's country (p. 215). All the countries whose practices were examined are said to permit suits against the governments in contract, in tort, and for violation of fundamental rights—if there is a showing of reciprocity (pp. 230–231). In Austria the rule of international law requiring compensation to aliens for expropriation is part of Austrian law; and in this matter aliens may be in better positions than Austrians (p. 243). The United States and West Germany provide by treaty that nationals of a party state may not be deprived by the other party state of property without just compensation; the German Supreme Court has held that nationals so deprived would be entitled to full compensation (pp. 244, 244n).

In 1965 the Executive Directors of the World Bank submitted to its member governments the Convention on the Settlement of Investment Disputes between States and Nationals of Other States. It is "posited on the theory that arbitration and conciliation are alternatives generally more preferable to alien investors than either exclusive reliance on the tribunals of host States or on the uncertainty of diplomatic representations" (p. 245).

The final chapter on "Techniques for Achieving Minimum Standards of Procedural Justice in National Tribunals" refers to the Latin American states' suspicion of "international attempts which they believe somehow might weaken whatever protection is afforded them by the Calvo Doctrine against overreaching alien investors" (p. 300). The Local Remedies Rule "would be of little relevance if States did not accept the obligation to open their courts and tribunals to alien litigants on a non-discriminatory basis with nationals" (p. 311). Private practitioners, the authors conclude, "must learn to regard themselves as agents or officers of the international legal order. . . ."

Students and practitioners of international law, as well as individuals and firms doing business in foreign countries, will find in this volume an instructive and welcome addition to the literature on the legal rights of aliens and alien companies.

ROBERT R. WILSON

Duke University

The Communist International: 1919–1943, 3 vols. Selected and edited by Jane Degras, (London: Frank Cass and Company Ltd., by arrangement with Oxford University

Press, 1971. Vol. I (1919–1922): 1956, 463 pages, \$22.50; Vol. II (1923–1928): 1960, 584 pages, \$30.00; Vol. III (1929–1943): 1965, 494 pages, \$22.50.)

The 1971 reissue of the three volumes of Comintern documents selected and edited by Jane Degras, and originally published in 1956, 1960, and 1965 respectively, is another indication of renewed interest in the activities of the international Communist movement in the period between the two World Wars. We have witnessed the publication of excellent studies on early Soviet foreign policy, biographies of key Communists (for example, Karl Radek and Antonio Gramsci), and newly uncovered documents and correspondence relating to the Communist International. Important work on the Comintern is currently being published, especially by scholars at the Hoover Institution. This material supplements but does not supersede Mrs. Degras's pioneering work and reinforces the judgment that her selections were judiciously made.

The Degras volumes hold up very well. The commentaries on the documents are informative and historically sound. The translations are uniformly excellent, models of care and clarity.

By far the most interesting years of Comintern activity are the 1920s, and the volumes are strongest here. Communists in Germany, France, and Italy were in the thick of political life. The Communist International was not yet the subservient tool of Soviet foreign policy that it was to become after its Stalinization in 1929–1930, and its internecine intrigues provide additional insights into the rivalries then existing within the Communist Party of the Soviet Union and even into the nature of international Communist relationships today.

The volumes concentrate on European communism; they are relatively weak on the Third World, whose parties, with the exception of the Chinese Communist Party, were marginalist movements. They are admirably organized and are valuable sources for scholars working on generalized treatments of Soviet and international Communist policies of the period, as well as for students being introduced to the language of intra-Communist discourse and communication. However, for specialists working on particular aspects of the 1919–1943 period, a detailed examination of all the original materials will still be essential.

University of Pennsylvania

Presidents, Bureaucrats, and Foreign Policy: The Politics of Organizational Reform. By

I. M. Destler. (Princeton, N.J.: Princeton University Press, 1972. Pp. xii, 329. \$10.00.)

There seems to be a small band of scholars, journalists, and practitioners who find a continuing fascination with the foreign policy and national security machinery of the United States. They are well served by Mr. Destler's book, which, it should be said, deserves a wider audience. He has written perceptively and thoughtfully about the foreign policy organization, carrying the story of its trials and tribulations through the presidencies of Kennedy and Johnson and most of Mr. Nixon's first term. Mr. Destler has read the relevant literature carefully and critically, and apparently talked to many knowledgeable insiders with equal skill.

His analysis is clearly strengthened by the "bureaucratic politics" perspective he brings to bear on the subject. He has not adopted the specific framework of any one writer but freely admits his intellectual debt to the work of such scholars of foreign policy making as Graham Allison, Richard Neustadt, Roger Hilsman and Morton Halperin, among others. While there are strong differences of opinion about the explanatory weight of bureaucratic-political factors, it is true that most of us who have written in this field have tended to overemphasize rational explanation and formal organizational structure and function while ignoring organizational processes and politics.

Wherever an appropriate balance may lie in the study of particular policies or crises (e.g., Allison on the Cuban missile crisis, Neustadt on the Skybolt and Suez decisions), the bureaucratic politics perspective is ideal for Destler's purposes, that is, the question of organizational effectiveness in the making and carrying out of American foreign policy or, as he puts it, "the central question of how organizational reform is to affect governmental practice" (p. 40). Destler defines bureaucratic politics as "the process by which people inside government bargain with one another on complex public policy questions" (p. 52). He goes on to explain the pervasiveness of the process as arising from two inescapable conditions: shared power and differing views concerning these questions. Thus, bureaucratic politics is viewed as a normal dimension of governmental decision making, to be taken into account in any efforts to improve the latter rather than to be circumvented or transcended by proposed reforms.

Armed with this critical stance, Destler has some shrewd and sensible things to say about the many reform efforts and proposals directed to the foreign policy organization over the past twenty-five years, and the doubtful assumptions

underlying most of them. His chapters on White House and State Department foreign policy making are excellent. Indeed, his description and analysis of foreign policy making patterns and procedures in the White House during this ten-year period are the best that I have seen in print. He makes clear the strengths of the Nixon-Kissinger arrangements while at the same time illuminating the more fundamental shortcomings that make them in his view an undesirable model for the long-term. He echoes the critical analysis of the State Department and the Foreign Service that has become almost standard in the postwar period, but more persuasively than most.

In characterizing the "general substantive staffs" that have in his view been most successful in meeting presidential needs in foreign policy, he cites the National Security Council staffs since Kennedy, and the Office of International Security Affairs (ISA) in the Defense Department in the 1960s. Given his strong emphasis on politico-military affairs and the generally low marks he gives to the performance of the State Department, I was a bit surprised that he did not give more attention to the role of the State Department's Bureau of Politico-Military Affairs in the Nixon-Kissinger period, as well as its earlier role as a staff in the 1960s. But this is a minor cavil (perhaps arising from my own service with that staff).

To raise serious critical questions about Mr. Destler's book, one must turn to his basic assumptions. If one asks why the foreign policy organization should be more effective, Mr. Destler's answers are the conventional ones: the overseas influence of the United States should be "exercised by coordinated government actions which support conscious, central United States policy purposes" (p. ix); the aim is "*purposive and coherent* foreign policy" (p. 4; italics the author's). Around whom is this strength and sense of direction to be built in the American government? Again the answer is the expected one: the president.

Mr. Destler is well aware that the conventional wisdom no longer goes unquestioned. He makes clear his own awareness that presidential will and wisdom are limited and that coordinated and coherent policies and programs are not necessarily good ones. He recognizes that his proposal for strengthening of State Department staffs at various levels of that organization is no guarantee of improved policy, while at the same time arguing that "the more that good people close to key officials are commissioned to raise hard questions, the more likely these questions are to be heard" (p. 291).

Clearly, none of this will satisfy those critics who insist that the concern to strengthen central, presidential control and direction is fundamentally misplaced. In their view, our direct problems have not come from lack of coherent, centrally directed and coordinated policies and programs but from too much presidential and national capacity to become involved and to project tremendous national energy and resources overseas. Before we further strengthen the system's effectiveness and its responsiveness to the will and purposes of the president, we had better concentrate, say the critics, on altering the values, attitudes, and perceptions of those who run our government, or the broader goals and purposes of the society, or indeed something even more radical, like fundamental change in its institutions.

Mr. Destler does not tackle these questions in any extended fashion, and there is no reason why he should, given the tasks he has set himself. He argues, as I have indicated, that the changes he proposes make sense in bureaucratic-political terms and that they should increase the system's capacity to think critically as well as to move more effectively. He will not satisfy the more radical contemporary critics of American foreign policy, whose questions do require serious pondering by students of the process as well as the substance of American foreign policy.

BURTON M. SAPIN

George Washington University

Soldiers Without Enemies: Preparing The United Nations for Peacekeeping. By Larry L. Fabian. (Washington, D.C.: The Brookings Institution, 1971. Pp. 315. \$7.50.)

This is a very good study indeed of the "peacekeeping alternative to collective security" by a Research Associate in the Foreign Policy Studies Program at the Brookings Institution. In the author's words: "This study attempts to provide a basic history of preparedness for UN peacekeeping, to isolate the factors most instrumental in shaping preparedness institutions and diplomacy, and to suggest some desiderata for analysts and policy makers thinking about the future of UN preparedness" (p. 9).

Chapters 1-6 consider past and current experience in planning and organizing international military forces. The first true peacekeeping actions are thought to be the League of Nations' efforts to insure peaceful plebiscites in Vilna (never carried out) and the Saar (completed, principally under British direction). They differed significantly from subsequent UN experience, however, in that major powers directed

the planning and execution and even participated in the operations with only the aid of soldiers and civilians from smaller countries. In contrast, UN arrangements have depended on initiatives by the Secretariat and smaller powers. The sum total of this experience has given rise to principles of action that dominate current thinking: consent, noncoercion and impartiality. Fabian takes note of a paradox in the UN experience. As peacekeeping activity increased, governments, in general, exhibited a marked reluctance to *prepare* for future contingencies. "Yet preparedness did make advances—and notable ones. What happened was that while peacekeeping services became more visible, peacekeeping preparedness went underground" (p. 79). Later in the work (p. 191) Fabian concludes that "tacit understandings about peacekeeping are more permissive than explicit consensus ever could be under present circumstances." A particular merit of the work is that planning is seen as a three-way struggle among diplomats, secretariat officials, and peacekeeping technicians. The reasonable demands of the latter two groups often cannot be met by the diplomats who have been unable to agree on the basics—how to authorize and direct an international force and how to supply it. This framework tells much more of the story than would an analysis limited to the national positions formally taken in formal bodies.

What advances have been made? A number of countries responded to political initiatives taken by the Secretary General or took initiatives themselves in concert with that official. While the Charter provides a shadowy model for this sort of thing, it is faint compared with the big-power initiative and control prescribed for enforcement forces. The newer model required, first of all, secretariat initiative and responsive "middle powers" such as Canada and the Nordic countries—not so large as to threaten and not so small as to lack influence. These powers have been persuaded of the need to prepare, and prepare *for*, the use of "standby forces." They have been joined for practical purposes by a "wider fellowship" of countries "that supply forces without setting up standby systems." Both in practice have depended on at least big-power acquiescence and crucial logistical and technical support principally by the U.S., the U.K., and Canada. It is difficult, of course, to qualify as a peacekeeping power. The U.S. is too big to be noncoercive or impartial, although her logistic and financial support has been essential. The Netherlands has so far been largely unable to put her preparedness measures into practice because she has been

compromised by her colonial past. While several countries—Ireland, India, Brazil and Yugoslavia—refuse to designate standby forces, they are nonetheless “prepared” by virtue of their participation in at least two of the UN’s three big peacekeeping operations in Egypt, the Congo, and Cyprus. Their balking at designating forces in advance preserves their freedom of action in a future perceived dimly at best.

In the two final chapters, dealing with the perspectives and the future shape of preparedness, Fabian sets forth a rationale and a plan of action to maintain the slight momentum that has been gained. Drawing on both the experience of past and current operations and the record of the Committee of Thirty-Three (UN Special Committee on Peacekeeping Operations), he posits a ten-point strategy looking toward a “parity of super-power noncontrol over the preparedness system” (p. 226). Concomitantly, an increase in political responsibility and resource planning is required of medium-sized and small powers. This is neither new nor earth-shaking. More impressive is the evidence Fabian adduces that this sort of thing has been and will be tolerated informally by the major powers despite *pro forma* disagreement. Although there is no possibility of enforcement schemes under the “original Article 43 punitive model,” Fabian concludes that the framework provided by this article plus the existing but unused Military Staff Committee might be used to prepare for peacekeeping contingencies. He suggests the Russians might go part way to meet American views on the operational responsibilities of the Secretary General since he is required as the UN chief administrative officer to execute the relevant decisions of the Security Council.

Although there is a long way to go before the world is prepared properly for peacekeeping, Fabian points the way. This policy study merits the influence it is doubtless having already on decision makers at the UN and in national capitals.

DANIEL S. CHEEVER

University of Pittsburgh

History of the Cold War: From the October Revolution to the Korean War, 1917–1950; From the Korean War to the Present. By André Fontaine. Vol. I translated by D. D. Paige; Vol. II translated by Renaud Bruce. (New York: Random House, Vol. I: 1968, Pp. 432, \$12.50; Vol. II: 1969, pp. 523, \$10.00.)

André Fontaine, a distinguished journalist from *Le Monde*, has produced a work of dis-

tinguished journalism; it is certainly not the best kind of history, although better history than many professional historians produce. Essentially, what Mr. Fontaine has written is an informed narrative with occasional analytical comments, in two volumes each divided into two parts. In the first volume, he discusses “Socialism in One Country,” which takes the story from 1917 to 1945, then “The Duel,” which looks at the years 1945 to 1950. In the second volume, “Learning the Facts of Coexistence” moves from Korea on to Hungary and Suez, and “China Takes up the Torch” starts with the launching of the first sputnik and ends with the deaths of Pope John XXIII and President John F. Kennedy. The style of presentation is lucid and for the most part congenial, although not everybody will care for such chapter headings as “Just a Moment, Mr. Executioner . . .” and “His Majesty Sputnik,” or for some of the thumbnail portraits which seem to come from the school of *Time* rather than from that of *Le Monde*.

Already widely praised for its fairness of approach, the work does indeed present its account honestly. Moreover, Mr. Fontaine draws on his own working experience to give useful descriptions of Hungary and Suez and the other critical moments of the Cold War. Examining the first “week of truth,” as he calls it, he draws an interesting picture of the predicament of Janos Kadar and convincingly describes the right-wing turn that the Hungarian government would probably have taken if Imre Nagy had not been removed. Turning to the second “week of truth,” he exposes the conduct of Anthony Eden in a merciless manner which may well have given Lord Avon cause to regret his own praise for the “objectivity and sense of purpose” of the first volume, and rightly points out how the whole adventure marked the effective end of the pretensions of the United Kingdom to act as a great power in special relationship with the United States, whether to the east or west of Suez.

While Mr. Fontaine’s two volumes are among the worthiest of the many produced on the subject during the last decade or so, they still fall short of the highest academic level, for his viewpoint is, surely if unwittingly, circumscribed by his background. In the first place, his outlook is very much that of a Western European. He talks of the “barbaric name” of the Azerbaijan (I, 280), which would not please the Azerbaijanis, and of the Berlin Wall as “most sinister symbol” of the Cold War (II, 3), which would bring howls of righteous indignation from Southeast Asia. The Chinese could

not be happy that the section entitled "China Takes up the Torch," starts and finishes with events taking place outside their borders, as described above. Second, the sources used are overwhelmingly of Western origin. Although Soviet sources (mostly in translation) are cited more often than in some self-styled "impartial" Cold War histories, there is little or no mention of such standard Soviet works as *Mezhdunarodnye otnosheniia posle vtoroi mirovoi voiny* [*International Relations after the Second World War*], edited by N. N. Inozemtsev and his colleagues. If such works are to be ignored for willful perversions of the truth, then a large number of Western interpretations, not to mention official government pronouncements, could be rejected on the same ground.

More seriously, the longer historical perspective presented in the work of the two major protagonists in the Cold War suffers from a severe imbalance. This is particularly noticeable in the first part and is indicated by the title, "Socialism in One Country." Considerable emphasis is given to the Russian Revolution of 1917, its aftermath and implications for international affairs. There is also the suggestion that the attitudes and policies of prerevolutionary tsarist governments were by no means completely dissimilar to those of their Soviet successors. Like George Kennan, Mr. Fontaine considers that many of the observations made by the Marquis de Custine on the Russia of Nicholas I have a strange applicability to the Russia of Joseph Stalin. He makes several references to the Byzantine and Muscovite origins of the "Soviet Empire" in a neo-Slavophile manner which posits a strong continuity from the past to the present. On the other hand, he does not seriously contemplate the possibility of comparing, say, the United States of James K. Polk to that of Franklin D. Roosevelt, nor does he even devote much attention to the foreign policy imperatives of the New Deal's "Capitalism in One Country," if that it can be called. There is little reference to "Manifest Destiny" or to the American variation of imperialism.

Exceptionally, the author does tell us something of the origins of the Monroe Doctrine as well as of its later extended application, while not following up the full background to Ivar Maisky's reported remark that "Russia, too, has its Monroe Doctrine." Although he cites an appropriate passage from the London *Times*, he fails to point out with sufficient force the purliness of Truman's decision to take action against Soviet interest in the Dardanelles on the grounds that "we might as well find out whether the Russians were bent on world con-

quest now as in five or ten years" (I, 217, 290), even if he goes on to call the enunciation of the Truman Doctrine a move with "all the brutality of a declaration of war" (I, 293). He gives nothing like sufficient weight to the impact on the Soviet Union of the Second World War (for example, its loss of about twenty million people as opposed to the loss of well under half a million by the United States) and to the fever pitch consequently reached by the traditional mania for security.

The severe imbalance in his longer historical perspective hampers Mr. Fontaine when he comes in his "Epilogue" to consider the years since 1963 and the direction that might be taken in the future. On the one hand, he fears that the partition of Europe will be consolidated "as long as the peoples of the Russian Empire have not succeeded in overthrowing the bureaucracy which has brought a world revolution to a path of the most selfish conservatism" (II, 490). This view is consistent with the neo-Slavophile picture previously presented of Soviet autocracy. On the other hand, he writes:

For a while it looked as if the triumphant wind blew, rather, from America—the new Rome. But soon, from the dollar crisis to the murders of Martin Luther King and Robert Kennedy, in the midst of the profound division created in the public mind by the Vietnam drama, it became apparent that the country suffered from a major internal crisis, perhaps the gravest since the Civil War, and that anything, including the advent of some kind of fascism, was henceforth possible in America (II, 483).

Here, the references to Rome and fascism are introduced without much possibility of referring the reader back to preceding argument, which has not prepared him for such allusions.

Although the work suffers from deficiencies in its handling of the fourth dimension of history and of the three dimensions of the contemporary world, it is to be recommended as a worthy attempt to write an impartial account of the Cold War.

PAUL DUKES

University of Aberdeen, Scotland

Origins of American Intervention in the First World War. By Ross Gregory. (W. W. Norton & Co., Inc., 1971. Pp. 157. \$6.95.)

Ross Gregory has written an exemplary essay on the American entry into World War I. Designed as supplementary reading in college courses, this work also repays careful reading by specialists. The author's background as a recent biographer of Walter Hines Page serves him well. He properly stresses the course of

Anglo-American relations against the general background of European conflict during 1914–1917. This analysis is truly synthetic, drawing upon all the extant schools of interpretation. Gregory gives careful attention to the economic entanglements with the Allies that developed after 1914 but correctly decides that these do not account for the act of April 2, 1917. He emphasizes but does not distort the roles of important figures such as Colonel House and Secretary Lansing. Like others in the mainstream of contemporary scholarship on World War I, he recognizes the president's realistic and practical bent, even as he points up Wilson's indisputable idealism. Wilson had no alternative to war in 1917, that is, if he wished to avoid an "unthinkable abandonment of rights and interests" (p. 130). Only a policy of complete isolation could have kept us out of war, and Wilson was in accord with popular feeling in refusing to retire entirely from international politics. The author wisely notes that considerations of national honor also played an important part, simply because of the nation's strength. "The more powerful the nation, the more the world expects of it and the more the nation expects of itself" (p. 135). American policy was "less a case of the man guiding affairs of the nation than the nation, and belligerent nations, guiding the affairs of the man" (p. 136). Wilson was free neither from domestic nor international pressures in reaching his decision.

I agree that Wilson was perfectly capable of staying out of the war, had he chosen that path. I would demur only in giving somewhat greater stress to the extraordinarily intense commitment Wilson made to bringing about a just and lasting peace. The failure of attempts to mediate the European struggle during 1915–1917 accompanied the president's growing obsession with controlling the postwar settlement as a means of disciplining not only the Central Powers but the Allied nations as well. As much as he hated war, he gave in to a stronger emotion, the desire to make a peace, and he finally came to believe that only by waging war could he force a peace of his own design. He fought so that, if necessary, he could dictate the terms of the treaties, and he succeeded. It cannot be said that he failed because of the way things went during the 1920s and after. The settlement that he imposed was never tried. The failure of the United States to participate in the treaty provisions fundamentally altered the character of the system that eventually materialized, so much so that it bore little resemblance to the one that Wilson had envisioned, even in the imperfect

form that he negotiated in Paris before the American defalcation.

Gregory offers a book that is judicious in scholarship and charmingly written as well. No one else need attempt to duplicate this essay for a considerable time to come. It is hoped Gregory will now turn to the course of events during 1917–1918, when the war was waged by the United States, a subject that still requires up-to-date synthesis.

DAVID F. TRASK

State University of New York at Stony Brook

Latin American Economic Integration and U.S. Policy. By Joseph Grunwald, Miguel S. Wionczek, and Martin Carnoy. (Washington, D.C.: Brookings Institution Press, 1972. Pp. 216. \$6.95.)

Industrialization in a Latin American Common Market. By Martin Carnoy. (an ECIEL Study, Washington, D.C.: Brookings Institution Press, 1972. Pp. 267. \$8.95.)

These companion studies represent a cogent plea to governing elites throughout Latin America as well as the United States to get on with the job of Latin American economic integration. Yet one cannot read them without wondering if even the authors themselves hold out much hope for significant progress toward the construction of a Latin American common market over the next decade.

In the first place, the authors are well aware that during the latter half of the 1960s the process of economic integration in Latin America was slowed almost to a halt. They trace this process, noting that only the subregional integration efforts within Central America and the Andean countries made any significant progress, and that the Central American Common Market itself entered a period of crisis and disintegration in 1968 which continues to the present moment. They conclude that "the road to a Latin American common market may well lead through such subregional arrangements as the Andean Group whose size and homogeneity make their integration easier than that of the highly diverse LAFTA membership" (*Latin American Economic Integration*, p. 61).

In the second place, the authors recognize the magnitude of the obstacles to the formation of a Latin American common market. Their awareness of difficulties which face further moves toward integration is revealed in their brief analysis of several major problems—including differing levels of industrial development; vested political and economic interests;

the attitudes toward integration of the military regimes in Brazil and Argentina; the relative indifference toward integration efforts on the part of Argentina, Brazil, and Mexico in consequence of the size of their domestic markets; a general fear of the potential predominance of U.S. multinational firms in a Latin American common market; and a significant, if ambivalent, desire among most Latin American countries to continue their independent bilateral relationships with the United States.

Against this admittedly pessimistic background both books seek to engage renewed support for the flagging integration effort. The ECIEL study does so by attempting to measure potential economic gains to be derived by Latin America from further integration. Specifically, it tries to determine the optimum location and size of plants in six selected industry groups within a regional common market in the target year 1975, and to measure the benefits to be gained from the integration of these industries. While stressing the uncertainties of the measurements attempted, the study concludes that the market expansion and product specialization accompanying the formation of a common market would offer significant opportunities for making Latin American producers of manufactured goods competitive in world markets, would free from 3 to 4 per cent of GDP each year to be used for further investment, and could benefit many Latin American countries which do not as yet possess large industrial sectors. One of the more interesting conclusions is that "whenever output moves to levels where economies of scale operate, as it would for many commodities in a Latin American common market, and transportation costs are significant, production costs would permit competition with developed countries even without tariff protection" (pp. 69-70).

While the message of the ECIEL study would seem to be directed at a Latin American audience, the message of *Latin American Integration and U.S. Policy* is clearly directed at Washington, D.C. The book begins by reviewing the now familiar history of Latin American economic development since the turn of the century, up to and including the moves toward regional integration in the 1960s. It then examines the U.S. view of integration efforts, a view which moved from initial indifference—if not hostility—to a gradual, though formalistic, embrace of the goal of Latin American integration by the middle and late 1960s.

The greater part of the book is devoted to a series of propositions which run approximately as follows:

(1) It is (or should be) a matter of significant U.S. national interest that Latin America experience rapid and "sound" economic growth;

(2) Such growth can be significantly aided by the formation of a Latin American common market;

(3) The initial costs of integration are too great for the less developed countries of the region to bear; and

(4) The United States should therefore support the integration effort by paying those costs which will otherwise seriously, if not fatally, affect further progress.

In elaborating the fourth proposition the authors call on the United States to reorient its Latin American foreign aid effort away from bilateral programs toward the support of regional projects and institutions which will entice Latin American governments into further integration. Such programs would include balance-of-payments support for countries experiencing difficulties during the transition to a common market, and adjustment assistance support for local industries hurt by the integration process. In all, the authors present a rather detailed blueprint for U.S. actions to reinvigorate the presently moribund Latin American commitment to the establishment of Common Market by 1980.

One suspects, however, that their blueprint, like so many others for Latin American unity, will never get beyond the drawing boards. In the first place, any relationship between the U.S. national interest and growth patterns in Latin America is at best highly tenuous. The decline in official U.S. aid to Latin America at least in part reflects that judgment, and the judgment is likely to become more pronounced as the concept of "U.S. national interest" is reconsidered in the post-Cold War international setting. In the 1970s more than ever, appeals such as the authors are making will stand or fall on humanitarian—not "interest"—grounds; and since the relationship between foreign aid and the development process is generally difficult to illustrate, even humanitarian appeals are likely to fall upon deaf ears.

In the second place, the proposition that Latin American integration can succeed if the United States pays all the insurance premiums is highly debatable. The authors explicitly recognize that the effort, in the long run, will depend upon the degree of Latin American commitment to integration, but that recognition often tends to disappear as the arguments concerning U.S. policy orientations are developed. A proper balance is struck in the conclusion that

Latin American nations must choose whether to make some sacrifices for more serious regional cooperation or, following the line of least resistance, to continue the autarchic policies that limit their development and deepen their dependence on developed countries. The United States can help in making a positive Latin American choice more feasible. Its offer of integration assistance, on a take-it-or-leave-it basis, will bring into the open Latin American development alternatives (p. 161).

For a host of reasons, some covered by the authors themselves and others developed in more theoretical approaches to the phenomena of regional integration, one suspects that at the LAFTA level, the Latin American choice will continue to be "the line of least resistance" for quite some time even if the authors' U.S. policy prescriptions were to be adopted.

ROGER D. HANSEN

Georgetown University

Studies in War and Peace. By Michael Howard. (New York: The Viking Press, 1971. Pp. 262. \$8.95.)

In an introduction to this collection, the author apologizes for reprinting essays and lectures that were produced originally as occasional pieces. The apology is entirely unnecessary. The book would be justified if it did no more than illustrate the development and broadening scope of Professor Howard's interest in military studies during the past fifteen years, which it does exceedingly well. But even the oldest of the pieces assembled here deserve to be reprinted for their own rather than their contextual merits, demonstrating as they do Mr. Howard's grasp of military theory and, when dealing with operational questions, his descriptive talents.

No one will complain, for instance, about the inclusion here of "Jomini and the Classical Tradition in Military Thought," a brilliant essay which appeared first in a *Festschrift* for Basil Liddell Hart. Here the great Swiss theorist's characteristic contributions to strategical thought are laid forth with clarity and economy, and those modern theorists who have fallen too completely under the influence of the German school are reminded that "in practice the influence of Jomini has been no less than that of Clausewitz, for it is in Jominian rather than in Clausewitzian terms that soldiers are taught to think" (p. 30). The essay on Waterloo which follows was written for the 150th anniversary of that decisive encounter; it remains the best brief account of the battle that this reviewer has ever read. As for three essays dealing with the evolution of military establish-

ments in the nineteenth century—on the decline of the Wellington system, on the reforms that gave European hegemony to Prussia in the wars of 1866 and 1870, and on Lord Haldane's institution of the Territorial Army on the eve of the first World War—they should be required reading for all military historians who aspire to be more than button-collectors or experts on forgotten battles.

Howard's interests in recent years, thanks in part to his association with the Institute of Strategic Studies in London, have turned increasingly to the study of international relations in the light of nuclear and missile technology, and this emphasis is reflected in the essays that fill the second half of this volume. The political and technological revolutions of our century have forced contemporary students of military affairs to grapple with problems unknown to their predecessors. "Strategic thinkers," Howard writes,

from the pioneers of the eighteenth century to Liddell Hart in his earlier writings, were able to assume a fairly simple model of international relations within which armed conflict might occur, as well as a basically stable technological environment. Neither assumption can now be made. No thinking about deterrence is likely to be of value unless it is based on a thorough understanding of 'the state of the art' in weapons technology. Any thinking about limited war, revolutionary war or indirect strategy must take as its starting point an understanding of the political—including the social and economic—context out of which these conflicts arise or are likely to arise (p. 183).

Howard pays tribute to American academic intellectuals of the 1950s—scholars like Bernard Brodie, Klaus Knorr, William W. Kaufmann, Albert Wohlstetter, Herman Kahn, Thomas Schelling, and Henry Kissinger—for having been pioneers in the new approaches to strategy. "Between them," he says, "they have done what Clausewitz and Mahan did in the last century, during times of no less bewildering political and technological change; laid down clear principles to guide the men who have to take decisions" (pp. 174f.).

But they have not, of course, answered all of the questions that trouble reflective men. "In most of the societies known to history," Howard writes, "war has been an established and usually rather enjoyable social rite" (p. 204). In the nuclear age, it is difficult to think of it in those terms. Even the persuasive argument that force is an inescapable factor in international relations and that one must therefore learn its forms so that it may be used, effectively and with restraint, for legitimate purposes leaves

the awkward questions dangling: *Whose* legitimate purposes? Does the legitimacy of authority legitimize the force it uses, or must we apply other criteria? Are there ethical considerations that should limit the use of violence, as many men throughout history have believed, without knowing how to define them?

These issues Mr. Howard discusses in a study called "Morality and Force in International Politics" in which he concludes, in effect, that it would be nice if we could assume that, if only statesmen were conscientious enough, they would always find ways to make moral and pragmatic considerations parallel each other rather than conflicting; but that neither history nor the Scriptures give us any reason to do so. The responsible statesman, as Bismarck once remarked to a censorious clergyman, does not have to be reminded about sin. "Anyone who reproaches me for being a politician without conscience . . . should sometime try out his own conscience on *this* battlefield."

GORDON A. CRAIG

Stanford University

Psychological Dimensions of U.S.-Japanese Relations. By Hiroshi Kitamura. (Cambridge, Mass.: Harvard University Center for International Affairs, 1971. Pp. 46. \$1.75, paper.)

This short monograph, containing a number of provocative insights but remarkably uneven in quality, may be seen as something of a watershed in studies of Japanese-American relations. Written in the months immediately prior to the announcement by President Nixon of his impending visit to Peking and the end of the post-1945 international monetary system, it embodies the narrowly bilateral focus and rather pollyanna-like assumptions that characterized the bulk of the American and much of the Japanese scholarship in this field in the postwar era. Moreover, the "area specialist" approach employed, discursive, highly factual, and analytically loose, succeeds in illuminating important aspects of the subject but lacks the rigor and clarity to which social science scholarship aspires. The sudden uncertainties and expanded importance of Japan has already led the more aggressive policy-oriented scholars (without special knowledge of the country) into the field, and it is certain that monographs like this one will in the future compete with more "professional" but not necessarily more insightful works.

Kitamura's monograph makes two main contributions: (1) an emphasis on the fundamental cultural differences between the two countries, as manifested in the Japanese perception

of the international system and (2) an inventory of relations since 1945 from this "psychological" perspective. Because of its remarkable cultural homogeneity, Japan is one of the few nations in which a "national character" study of this sort is useful. As a corrective to works focusing exclusively on the economic, political, or strategic dimensions of relations between the two countries, the book has considerable merit, for the cultural-psychological dimension of interaction is of unique importance in Japanese-American relations.

Unfortunately, the impact of the argument is substantially diluted by fuzzy conceptualization and a tendency to overgeneralize. Although it is assumed that there is a basic compatibility between Japanese and American "interests" and that harmonious relations will result simply from proper communication, "interests" are left undefined, and no consistent distinction is made between real and perceived interests. The term "psychological factors" is not carefully defined, and in the end the author ends up psychologizing politics (e.g., on pp. 6-7, bilateral economic conflicts are essentially seen as the result of "psychological factors"). In dealing with Japanese opinion, no effort is made to distinguish between "elite" and mass opinion and even to confront how these opinions are distilled into policy through the political process. Finally, evidence ranging from sweeping historical generalizations to data from opinion polls and casual observations of literati is cited without any real discrimination. The result is a kind of smorgasbord of unconnected comments which baffles as much as clarifies.

The monograph deals with an important subject from a fresh perspective. While it has intrinsic merit and the author is obviously sensitive and knowledgeable about Japanese foreign affairs, it is rather surprising that a greater effort was not made to incorporate more fully into this work theories and concepts from psychology and politics.

Seeking World Order: The United States and International Organization to 1920. By Walter F. Kuehl. (Nashville: Vanderbilt University Press, 1969. Pp. 385. \$8.95.)

A work primarily of interest to specialists, Professor Kuehl's book traces the development of ideas about international organization in the United States up to 1920, concluding with an assessment of the role played by the American "internationalists" and publicists in the debate over the League of Nations. As intellectual

rather than political history, the book exhibits the weaknesses and strengths of this genre. On the plus side, Kuehl records the wide diversity of ideas, opinions, and organizations which worked for the cause. The result is a clear picture of the confusion of aims, commitment to over-rationalistic and legalistic conceptions of the problems involved, as well as the role the publicists had in creating a somewhat auspicious climate for Wilson's Covenant while eventually helping to doom it to defeat because of their disagreements with Wilson and among themselves.

On the negative side, the book's organization makes the reader's job quite tedious. The strict emphasis on chronology has the disconcerting effect of intruding descriptions of minor publicists of little importance into the narrative, apparently solely to insure comprehensiveness and chronological neatness. Since the book deals mainly with ideas, there is little attempt to assess carefully the influence of various groups and individuals. No careful distinction is made between their impact on the general public as opposed to that on policy-influencing elites. Nor is there any useful discussion of the social and political groups involved or how they relate to each other. All we have is a bare-bones account of the organizations and brief biographies of individuals. Admittedly the author set out to chronicle ideas, not politics, but without some more careful attempt at analyzing impact—admittedly difficult without survey data—we are left in a welter of confusion and profusion of names, dates, and concepts. The book comes to life only in the all too rare excursions into the political dynamics of the period.

Yet even here the result is curious. For example, Kuehl concludes that one reason for Wilson's failure to sell the League was his ignorance of and inattention to the work of these internationalists in developing ideas about international organization. Thus he presents a paradoxical criticism of Wilson as unrealistic because he did not take sufficient notice of these people's work despite his implicit—and explicit in a couple of instances—assessment of these forces as being without significant political influence. Perhaps it is the overemphasis on the ideas and arguments of the publicists that leads Kuehl to give greater weight to the effects of Wilson's disdain for this group than is merited. This leads to a more general point; this kind of intellectual history is to some degree dysfunctional because it makes for poor political history.

Japanese Foreign Policy on the Eve of the Pacific War: A Soviet View. By Leonid N. Kutakov. (Tallahassee: The Diplomatic Press, Inc., 1972. Pp. 241. \$15.00.)

Dr. Kutakov is a distinguished diplomatic historian as well as one of the Soviet Union's most experienced senior diplomats in the Asian region. He served in China during 1955–57, certainly a crucial period in Sino-Russian relations, and in Japan during 1959–60. After serving as a senior member of the Permanent Mission of the USSR to the United Nations, he joined the UN Secretariat as Under-Secretary-General for Political and Security Council Affairs. Dr. Kutakov brings both academic expertise and professional experience (though more of the former) to his analysis. Both he and George A. Lensen, who edited the translated manuscript, are to be congratulated for making available a Russian perspective on the policies of Japan in the latter half of the 'thirties and first half of the 'forties.

Dr. Kutakov divides his study into four substantive chapters and one retrospective epilogue. In the first, he delineates the policies that led Japan into an alliance with Hitler's Germany and Mussolini's Italy. It is, in broad outline, the familiar story of the background and negotiations leading up to the Japanese-German "Anti-Comintern Pact" and, ultimately, the Tripartite Axis Alliance. Most of the details, at least according to the footnotes, are taken from documents of the International Military Tribunal for the Far East (I.M.T.F.E., i.e., the Tokyo "War Crimes" trials) which Soviet scholars refer to as collection 436b of the Foreign Policy Archives of the Ministry for Foreign Affairs of the USSR. Because it is Japanese archives which were brought to light by the I.M.T.F.E. it is extremely difficult to determine how Russian foreign policy makers in the 1930s were perceiving Japanese foreign policy. One can only regret the absence of any reference to Soviet Foreign Ministry archives of the 1930s.

In the second chapter, on Japan and England, the primary source is *Documents on British Foreign Policy 1919–1939*, published by the British Foreign Office in 1955. Much of this section is devoted to the proposition that the British were intent upon appeasing the Japanese with a Far Eastern version of the concessions made at Munich for Europe. This interpretation hinges on the Arita-Craigie Agreement of July 23, 1939, by which Britain acquiesced in Japan's territorial seizures from China. "The events cited above show that the Arita-Craigie agreement had not been forced on the British

government by the aggravated situation in Europe in the summer of 1939 as asserted by bourgeois historians [the footnote cites Professor E. L. Woodward], but was a manifestation of the time-honored strategy of directing German and Japanese aggression against Russia" (p. 126).

For the third, which focuses on Japan's relations with the Soviet Union, the author does refer to some of the material available in the archives of the Soviet Union's Ministry of Foreign Affairs. Much of it relates to the endless friction over fishing rights. There is regrettably all too little discussion of the origins (from the Soviet perspective) of the Neutrality Pact negotiated by Foreign Ministers Matsuoka and Molotov in the spring of 1941. By contrast with the motivations behind the Arita-Craigie Agreement, "the Soviet Union signed the Neutrality Pact in an attempt to preserve peace in the Far East . . ." (p. 193).

The fourth chapter, which concerns the collision between Japan and the United States, emphasizes "the long-standing rivalry of the imperialist powers [i.e., the U.S. and Japan, which] had grown ever more acute" (pp. 200-201). This judgment is followed by a kind of classic, if unfootnoted, set of assertions concerning the motivations behind American foreign policy.

American capitalists could not reconcile themselves to the gradual subordination by Japan of China, a potentially vast market for the United States, nor could they agree to Japanese seizure of Southeast Asia, a major source of strategic raw materials. But while some American leaders realized that war with Japan was inevitable, others linked with business concerns that had lucrative dealings with Japan, tried to avoid a collision by appeasing Japan (p. 201).

This volume is probably far more valuable to American readers for the insight into Russian research that it provides than as an analysis of how Japanese-American relations of that era ended in the explosion of Pearl Harbor.

In the epilogue, Dr. Kutakov sets forth the lessons that are to be learned from a study of Japanese foreign policy. Basically it "shows the cost and futility of resorting to force in international relations" (p. 230). Additionally, a brief summary of the war years is recounted. Interestingly enough, the only reference to the Soviet Union's denunciation of its Neutrality Pact with Japan in April 1945 is that it was a "heavy blow for Japanese diplomacy, which had hoped to take advantage of the contradictions existing among the allied powers to secure a peace which would leave Japan in possession of some of the territories she had conquered"

(p. 224-225). Possibly so, but what about the Soviet Union's leaders' motivations? Nothing is written.

Withal, this book does make for interesting reading, and not only as a Russian view of Japanese foreign policy. It also provides a different set of hypotheses on the origins of what the Japanese call "the Pacific War." Finally, by indirection, it gives some clues to the well-springs of the foreign policy of the USSR.

HANS H. BAERWALD

University of California, Los Angeles

Jungle Alliance: Japan and the Indian National Army. By Joyce C. Lebra. (Singapore: Asia Pacific Press, 1971. Pp. 255. \$8.00.)

This book adds another segment to the gradually unfolding story of Japan's wartime relations with Asian nationalist movements. There are certain unique elements in the case of the Indian National Army, the subject at hand. India was peripheral to Japanese concerns and its conquest and inclusion within the Co-prosperity Sphere were not part of Japanese overall strategy. Moreover, there was no Japanese occupation of Indian territory (one can hardly count the Andaman and Nicobar Islands). Consequently, as Dr. Lebra points out, there tended to be fewer direct confrontations between the Japanese and the nationalist leadership.

At the same time, certain general characteristics of the relationships in occupied areas do occur in this instance as well. For the Japanese, the requirements of the war had to take precedence; their interest in Indian independence was primarily for propaganda purposes. For the Indian, as for other nationalists, independence came first. The difference in priorities inevitably gave rise to misunderstanding, tension, and occasional conflict. Dr. Lebra's contention that Japanese policy granted the form but not the substance of independence (the Andaman and Nicobar Islands remained under Japanese Navy administration even after a formal transfer of sovereignty) is one that is valid for occupied areas as well.

In this, as in respect to other nationalist movements, the Japanese were able to secure the cooperation of a nationalist leadership with some stature. True, they were slow to recognize the potential value of Subhas Chandra Bose and to bring him back from Berlin. Prior to his return, their attempt to work through Rash Behari Bose, a long-time resident of Japan, was not particularly successful. To the Indians he was too much the spokesman for Japanese interests and too removed from current national-

ist concerns. S. C. Bose, on the other hand, was someone who fitted readily into the leadership role, who could inspire confidence and unite divergent interests. The force of his personality affected Japanese as well as Indians. In Dr. Lebra's view Bose's impact on Tōjō unquestionably gave INA interests a better hearing in Tokyo, for prior to their meeting, Tōjō had been generally unimpressed with the INA and its potentialities. It was a tribute to Bose's abilities that he was able to bargain as effectively as he did from what was an inherently weak position.

Among the most interesting parts of this book are the glimpses provided of the personal views of several of the participants. It is abundantly clear that there was no such thing as the Japanese "military point of view" in respect to the INA. (Nor was there one on the general question of the role of nationalist movements.) The variation in views was not just a matter of where one stood in the chain of command or of whether one's perspective was that of Tokyo or of the field of operations; individual differences existed. The change in Tōjō's evaluation of the INA after his encounter with Bose was mentioned above. General Kawabe, Burma army commander, became emotionally involved with the INA. On the other hand, Field Marshal Terauchi, commanding the Southern Area Army, was less sympathetic and reflected the imperious attitudes associated with the stereotyped Japanese officer.

The most appealing figure, on the Japanese side, and the person who dominates the early part of this story is Major (later Lieutenant General) Fujiwara Iwaichi, the head of the *F Kikan*, an intelligence unit operating in the Malay and Chinese as well as Indian communities in Southeast Asia. Highly idealistic, perhaps even a bit naïve, imbued with the idea that the cause of Japan was also the cause of Indian independence, and firmly believing that to inspire trust one had to demonstrate it, Fujiwara played a key role in the inauguration of the INA. The bond of personal trust between Mohan Singh and himself lent a touch of romantic idealism to the initial period before the inevitable rush of events overtook both of them and brought significant changes in the relationships on both the Japanese and Indian sides. Had there been more Fujiwaras in the Japanese military, the ultimate fate of the INA and other nationalist movements would doubtless have been little different. The image of Japan in postwar Asia, however, might have some softer tones.

In respect to this last point, Fujiwara was surprised at the scarcity of information about

India available in Japan, inside or outside the military. In spite of talk of the common tie of Buddhism, in spite of Tagore and Okakura Kakuzō, a wide gap separated India and Japan. In the postwar world, the quantity of information is greater, but the gap would not appear to have narrowed appreciably.

Dr. Lebra has produced a very fine book. Well written, with a generally good balance between the broad scope of events and personal viewpoints, it is eminently readable. Her wide-ranging research in a variety of sources, including interviews, affords the sort of multidimensional approach which this story requires.

WILLARD H. ELSBREE

Ohio University

Khrushchev and Kennedy in Retrospect. By James E. McSherry. (Palo Alto, Calif.: The Open Door Press, 1971. Pp. 233. \$8.95.)

The Kennedy Doctrine. By Louise Fitzsimons. (New York: Random House, 1972. Pp. 275. \$7.95.)

"Why Suffer for Saigon—or Die for Danzig?" The phrase alone (the title of Mr. McSherry's concluding chapter) should be enough to keep the best intentioned reader away from his book. Its author—a former intelligence officer—still lives in the unquestioned age of brinkmanship: the future of world peace, in his view, remains determined by the balance of America's account in "the Bank of Soviet Respect." As examples of substantial deposits which forced Soviet leaders to revise their judgments of America's will are Truman's decision on Korea, Eisenhower's dispatch of troops to Lebanon in 1958, the U-2 incident when Washington said in effect "Yes, they're ours. And just what are you going to do about it?" (pp. 53-4), down to Vietnam where Johnson's action in sending combat units is seen as being directly responsible for Khrushchev's downfall and his successor's restraint (p. 199). It is a strange reading of history to which we are submitted, one which continues to make the old Cold-War distinction between the Russian people and the Soviet regime, and a no less disturbing reading of the future as well, for which "liberal sheepish politicians" who persist in bleating their appeasing slogans within earshot of the Soviet wolves are in advance held responsible for the extinction of "the Common Man" (p. 201).

"Extensive, unilateral concessions on the part of Washington," the author writes, "will inevitably put the United States in the position in which France found herself in August 1939"

(p. 193). A reading of Mr. McSherry's book, and a review of the postwar period which is dealt with in this book, leave one unimpressed by America's "extensive" and "unilateral concessions." Nor is this notion of inevitability in the recurrence of historical situations easily acceptable either. Indeed, how much longer will allegedly serious men continue to live the present in the light of a misconstrued and misused past? Understandably, the guidelines which security policies follow are bound to be anchored in the past. But whether for the statesman who defines those guidelines, or for the observer who "explains" them, it is still useful to comprehend that past first and apply it correctly next. Thus there was not as much continuity in the appeasement of Hitler as Mr. McSherry appears to assume. The show of force by the Czech government in May 1938 is a case in point. To be sure, such action forced Hitler's diplomatic retreat. But it also prompted him to cancel a previous order that had ruled out any kind of military action against the embattled democracy. Coercive diplomacy and appeasement come together, and between May and September 1938 the roles were reversed. Of course, the other protagonists, namely the Western democracies, did preserve an appeasing attitude throughout. But the case against such a policy rests essentially on the subsequent discovery that Germany was not prepared for war in the fall of 1938 and that Hitler's ambitions were unlimited. Unfortunately, such information was not recorded at the time.

Furthermore, the application of this particular historical episode to the postwar situation leads the author to assumptions which are quite debatable. For one, it assumes that the objectives of the Soviet leaders too were unlimited—a notion which most scholars now reject as unfounded, on the basis of a research which goes far beyond Mr. McSherry's preferred sources, namely, the *Pravda* and *The New York Times*. Nor can postwar Soviet weakness be seriously compared to prewar German insufficiency. Nor, again, did the U.S. appease all that much. From Truman to Nixon one wonders, in fact, how much more we could have coerced, "For its part" writes McSherry, "the United States should respect legitimate Russian (not necessarily Soviet) national interests" (p. 193). One wonders how such recognition of Russian interests (however minimal) is reconciled with the author's recommendation that Washington maintain an "unbending attitude" toward the Soviet regime.

Much more commendable is Louise Fitzsimons' book, *The Kennedy Doctrine*. The

theme here is simple and, by now, is gaining increasing recognition. "Kennedy's policies were as dominated by cold-war thinking as were those of his predecessors" (p. 8); even more so in fact, since "American foreign policy before 1961 was essentially a reactive effort" (p. 7), whereas it became an aggressive one in the sixties. To Fitzsimons, as to so many of Kennedy's critics, the admission of the President's failure is a sad one. He failed, we are told somewhat regretfully, to understand and use "his own potential for leadership and accomplishment" (p. 243). He should have done and could have done more. As it was, his was "a counterrevolutionary and counterinsurgency policy" (p. 8) which failed to deliver on the many promises pledged by an otherwise brilliant rhetoric.

Thus the account of Kennedy's foreign policy takes us through a familiar journey: the Bay of Pigs, regarded by the author as Kennedy's "greatest mistake"—a "colossal error" from which "consciously or unconsciously (he) spent the rest of his administration and his life trying to recover" (pp. 18, 70); Khrushchev's manhandling of Kennedy at Vienna, and Kennedy's "extravagant" response and subsequent determination to reassert America's "role of leader in freedom's cause" (p. 81); the Cuban missile crisis when the American president "risked the destruction of all life on earth," a crisis which could have been avoided, Fitzsimons suggests, had Kennedy shown a greater willingness to pursue a diplomatic route at a time when the "survival of the republic" was not directly threatened (pp. 126, 170-2); and, finally, the "fatal illusion" of counterinsurgency war, especially as it was applied in Southeast Asia, and the escalation of the nuclear arms race at a time when "in the opinion of many knowledgeable observers, within the government and without, there was in early 1961 an opportunity to halt" it (p. 215).

However appealing, and in part true it is, the author's thesis appears to be confined essentially to a time period which starts too late and ends too early. It starts too late because it does not take sufficiently into account the legacy of the Eisenhower administration. Thus, by January 1961, an impressive number of key problems had been accumulated by the retiring president for the incoming one; a credibility gap in the U.S.-Soviet relations, following the U-2 incident; the Laos affair for which an invasion involving U.S. troops had been planned; the invasion of Cuba; postponement of a decision on the question of ABM deployment; relations with the Atlantic Alliance and, more spe-

cifically, relations with de Gaulle, whose September 1958 memorandum had remained unanswered—to cite but a few. Most of these issues matured in the spring of 1961. To be sure, as the author reminds us, “the Presidency of the United States provides little room for on-the-job training” and we should expect from the president “a mature and balanced judgment from the day he enters into office” (p. 69). Still, in the spring of 1961, whose foreign policy was it, Eisenhower’s or Kennedy’s? Can any one man “change” foreign policy single-handed in a matter of a few weeks? If he cannot, given the circumstances which prevailed at the time, is one justified in alluding disdainfully to Kennedy’s cold war policy, or even to such a thing as a Kennedy doctrine? For that matter, assuming that there is such a doctrine, can one retract it, uninterrupted, during the full Thousand Days? I, for one, doubt it. Occasionally, the author recognizes a “capacity for growth” in the late president (p. 69). It is this capacity which made him ultimately understand the true nature of his own potential for leadership. One may agree that much that happened before and during the Cuban crisis of October 1962 was unfortunate, to say the least. But one may at the same time recognize that following the crisis, Kennedy did look for new options as he began at last to think in terms of a new perspective, less imperial and more conciliatory. The evidence appears here and there—in the Test Ban Treaty, in the American University Speech of June 1963, in some of his latest statements on China, Vietnam, and the rest of Asia. It is not just a matter of iffy history either. Kennedy’s presidency was just too short to warrant passing much judgment on it.

SIMON SERFATY

The Johns Hopkins School of Advanced International Studies

Russia and China: Their Diplomatic Relations to 1728. By Mark Mancall. (Cambridge, Mass.: Harvard University Press, 1971. Pp. 396. \$12.00.)

Together with Clifford Foust’s monograph on Russo-Chinese trade relations from 1725 to 1800 (*Muscovite and Mandarin* [Chapel Hill: University of North Carolina Press, 1969]), Mancall’s book on the beginnings of diplomatic relations between the two countries provides for the first time a sound scholarly analysis of the initial stages of such relations.

The background of the two crucial treaties, Nerchinsk (1689) and Kyakhta (1727), is explored from the time of the first officially authorized mission, Petlin’s (1618), to the Golo-

vin mission which negotiated the Nerchinsk treaty and finally that of Sava Raguzinskii-Vladislavich which concluded the Kyakhta treaty. The initiative was the Russians’ throughout, resulting from the conquest of Siberia and the penetration of the Amur region by outlaw, unofficial, and official Russians in turn. Both Chinese and Russian materials have been investigated to produce a close study of the purposes and results of each successive mission.

Mancall’s interpretative passages are interesting. He compares the Chinese “tribute system” (inherited by the Manchus) with “new ideas introduced into the traditional East Asian world by the Russians” (p. 8). His explanation of the difference between how the Ch’ing government treated the nomadic northwest and how it treated the agricultural southeast is clear and helpful, though the ease with which Russia was assimilated to the nomadic northwest in Chinese diplomacy might have warranted comment. Moscow, we are told, represented a European tradition not yet “universalized through imperialism and colonialism,” a tradition which “insisted on the equality of nation-states and sovereigns” while the Ch’ing system “recognized the existence of only one civilization . . .” (p. 65). Actually European countries had since the outset of the Age of Discovery dealt with many petty chiefs and principalities the world over, by no means as equals, whereas China’s exclusiveness and rhetorical pretensions to be the whole world had not prevented intercourse with foreigners. Mancall’s painstaking account of events does not in fact seem to suggest that differing world views impeded early Sino-Russian relations very much. Unauthorized or inept moves were made by both sides; but rational adjustments of conflicts and arrangements for trade and diplomacy were worked out with remarkably little fuss. The author is quite right to contrast the post-1840 shock to earlier Chinese ways of conducting foreign relations with the period of his inquiry. What seems worthy of note, as his book shows, is how well the pre-1840 system worked.

The author has striven for precision. In fact, he overdoes it a bit; for example, he translates Sava Raguzinskii-Vladislavich’s name in the text of the Treaty of Kyakhta fifteen times as “the Illyrian Count Sava Vladislavich” to avoid rendering “Raguzinskii” as a surname, and he refuses to use “Spathary” (Spafary) as the name of Miclescu, because “Raguzinskii” means “Ragusan” and “Spathary” means a “spatar”—an official title; but the ordinary reference book lists the two men under “R” and “S” respectively. The notion of “surname” was not a fixed

one in seventeenth-century Russia anyway, and one is reminded of those cataloguers who cross out "Lenin" and write "Ulianov" on book cards. There are a few minor errors: Križanić was a Croat not a Serb; Nurhaci was not in fact an "early Ch'ing emperor"; in 1689 Peter the Great was only technically "on the throne," with the actual rule in other hands; *deti boiarskie* were not "boyar sons" but lesser boyars; there is no such place as "Vyatsk" (Vyatka?) or "Yarench" (Yarensk); either "Buchholz" or "Bukhholts" (if soft sign is omitted) will do for a Russianized German name but "Bukhholts" will not. The K'ang-hsi emperor's remark that Peter I exposed himself too frequently to ocean voyages is called "not surprising" coming from a continental monarch, but it is indeed surprising because Peter was also a continental monarch who never took any ocean voyages at all. Paisios Ligarides was scarcely a "representative of the Greeks in Russia," but a renegade cleric looking out for his own interests who was titular metropolitan of Gaza while he was in Russia. Milescu's report that the Peking Jesuit Verbiest was more loyal to the Russian tsar than to the Ch'ing emperor deserves a skeptical comment. Russian transliteration is something of a problem to the author. He uses neither the standard British, the standard American, nor the so-called international system; what he does use is not open to serious question except for "sch" (instead of "shch") which is German, not Russian. But within his system there are too many mistakes, at least some of which an editor ought to have caught. There are also errors in French and German, though romanizations from Chinese seem almost perfect, and there is an admirable glossary of characters. There were formidable linguistic problems in the preparation of the manuscript, but three errors in three languages on p. 361, for example, are not what one expects of a major press.

Despite such minor faults, the book reflects commendable documentary research and objective, critical analysis throughout. Even if all questions regarding the inception of Sino-Russian relations are not disposed of, they have received a thorough and fair examination. Few people anywhere in the world can bring absolutely all of the desirable skills and knowledge to the study of such a topic.

University of Washington

The Asian Engineering Brain Drain. John R. Niland. (Lexington, Mass.: Heath Lexington Books, 1970. Pp. 182. \$12.50.)

Concern over the international "brain drain"

from European countries became intense during the mid-1960s, but subsided after 1968. Recently, however, another current in the problem has surfaced, namely the brain drain from the less developed countries to the more developed ones.

This kind of drain has been widely regarded as hampering economic development in the countries of emigration, and with amounting to "exploitation" of the latter by the receiving countries, and more specifically with imposing "reverse foreign aid" which offsets the direct aid contributions. These new problems are not so susceptible as before to resolution by the theory of international comparative advantage and re-equilibrating movements in a worldwide free market. Then the Soviet Union in 1972 gave traumatic expression to the issue by imposing an exit tax on a sliding scale according to the extent of education received.

These new concerns have produced another spate of publications and debates. Currently the National Science Foundation is conducting a large questionnaire study on foreign scientists and engineers in the U.S. At the United Nations, two major studies have been launched: one by UNITAR on the *causes* of the migration from the less to the more developed countries; the other by the Social Development Division, under the direction of this reviewer, on the economic *effects* of the migration upon the countries at both ends.

Professor Niland's book falls in the new area of concern, but his title is too broad: he actually deals only with the drain of Asian engineering students who enroll in U.S. graduate schools and then postpone or avoid returning home. He makes only passing references to the persons immigrating into the U.S. as already trained professionals—although according to his own estimates they comprised 40 per cent of the engineers and scientists draining from the less developed countries, 80 per cent of the physicians, and nearly the whole of the brain drain from the more developed nations (and more since 1967, Niland's base).

The core of his book consists of the replies obtained from a questionnaire which Niland circulated among a sample of the Asian graduate students in engineering already mentioned. What he obtained is a description of their present traits (e.g., skills, previous education, sources of support, work experience, etc.) and their locational intentions, but not the record of their actual movements.

From the outset, Niland assumes that nonreturning students are a serious drain on their home country; but he never really demonstrates

this main point. First, he strains to establish extremely high percentages of "nonreturn"; but to accomplish this he must narrow the base from "all foreign students" to just those students who in any year are "in position to seek conversion of their visas" from student status to immigrant status. Second, when Niland deals with the direct costs of the foreign students to their home countries, he finds only the rather small costs of overseas transportation and of the first six months of U.S. residence—since the replies to his questionnaire showed that most of the foreign students quickly attached themselves to U.S. sources of support!

Trying to cast a wider net, Niland then proposes a kind of opportunity cost: the losses to the home country from early return, owing to the fact that younger professionals earn less, and bring home less accumulated savings, than if they had stayed abroad longer. On this basis he even advocates deferred return! But this feature can hardly be taken as the principal "cost of emigration," as compared with lost contributions to the national product. And Niland concedes that those who stay abroad a long time may indeed never return.

The book does provide some new and useful figures on the sources of support for these engineering students, and on their accumulation of savings. It is regrettable that Niland did not publish the replies on remittances and some other important items on his questionnaire.

Niland barely recognizes the dimension of loss from nonreturn in terms of the ratio to the home stock of professional manpower and the extent of home vacancies—although clearly the "loss" will be small or nil for a country like the Philippines, which already shows a surplus in certain professions. Finally, the author never compares the losses ascribed to nonreturning students with the losses associated with emigrants previously trained in the home country. It is the latter category which poses the urgent problem for the countries involved in the professional migration at both ends. Studies now in progress indicate the likelihood of a "negative-sum game" here: relatively heavy costs to some weak and poor countries of emigration, in direct outlays lost and occasionally production foregone, and on the other hand, only relatively small gains accruing to the large and rich economies of most of the receiving nations.

The Politics of Foreign Aid in the Brazilian Northeast. By Riordan Roett. (Nashville:

Vanderbilt University Press, 1972. Pp. 202. \$8.95.)

Roett's *The Politics of Foreign Aid in the Brazilian Northeast* describes how the emergence of political forces challenging the traditional oligarchies in the Northeast during the 1950s and early 1960s and the energy and genius of Celso Furtado led to the creation of the Superintendency for the Development of the Northeast (SUDENE), a new federal agency to plan, coordinate and supervise the development of the region. The author argues that the SUDENE's concern with economic and social injustices, independence from the traditional power structure, and promise of rational planning and honest project implementation offered the United States an ideal opportunity to support a movement consistent with the objectives and promises of the Alliance for Progress. Professor Roett demonstrates, however, that despite the pronouncements from the highest levels of the United States government supporting social, political and economic reform and the SUDENE as a promising institution for effecting such reform, the implementation of the foreign aid program between 1962 and 1964 actually served to undermine the SUDENE's position and support the traditional oligarchies opposed to reform.

This book provides a valuable description of the political factors surrounding the creation of the SUDENE and the United States role in the Northeast from 1962 to 1964. Unfortunately, the rather narrow focus on political reform has led to conclusions which overstate both the SUDENE's internal mandate and capabilities for reform and the reactionary impact of the U.S. AID program.

While the weaknesses of the SUDENE are given little weight in the conclusions, they do emerge from the book. The SUDENE appears as an agency which never had a mandate for effective reform, avoided the areas most essential to major reform, lacked the power to discipline or force compliance with its program, and had no proven ability to plan and implement programs that could successfully utilize foreign capital or personnel. Dr. Roett never reconciles SUDENE's internal weaknesses with his conclusions that the SUDENE was a radical reform effort that was undermined primarily because of the lack of U.S. AID cooperation, or that the U.S. AID's by-passing of the SUDENE was motivated by and designed to prevent the spread of communism. For example, it seems as plausible that the U.S. AID by-passed the SUDENE because of a belief that it was unwise to base an entire program on one techni-

cally and politically weak agency or that the SUDENE Master Plan was not the best approach to reform and development in the region. It might be argued that the U.S. AID's emphasis on education and health, areas which the author explains were outside the expertise and influence of the SUDENE (p. 47), are as important to long-run economic and social reform in the Northeast as the emphasis of the SUDENE program. It is not clear when or how the illiterate, malnourished, disease-ridden masses were to benefit from the SUDENE's emphasis on infrastructure, basic industry, and colonization projects that would never affect more than a tiny fraction of the people. The author's implication that the AID should have cooperated fully by turning over all funds to the SUDENE with virtually no strings attached appears warranted only if the AID's sole objective were to promote political reform.

The lesson I see from the SUDENE experience is that real reform in the Northeast will come only after there is a much stronger, long-term commitment for such reform at the highest level of Brazil's government. And when that date comes, Brazilian nationalism ensures that the United States' role, either as a deterrent or a catalyst for reform, will be marginal at best.

My downplaying of the role of the United States in the SUDENE experiment should not be interpreted as a whitewashing of the U.S. AID program in Brazil, which throughout the 1960s belied any serious commitment to the reform objectives of the Alliance for Progress. A central question raised by this book is how to explain the gap between the goals of the Alliance for Progress and the actual implementation of the United States foreign assistance program. The author's discussion of the time pressures imposed on the Northeast mission to produce a program with short-term results touches on a major cause of this gap. Roett implies that these pressures derived primarily from the desire to launch a highly visible program to stem the growing Communist influence in the northeast. The pressure to demonstrate immediate results, however, and the tendency of the AID program to support the traditional economic, political, and social forces within Brazil remained long after the 1964 military coup eliminated any serious Communist threat. In fact, as long as foreign assistance must be justified annually and bureaucrats rewarded on the basis of the funds moved, the U.S. AID programs will probably continue to reflect these characteristics.

Programs sensitive to economic, political or social reform generally require putting re-

sources into channels where the risks are higher and the results longer-range and more difficult to quantify. The U.S. AID has placed a high priority on minimizing the complications and risks of transferring resources. Problems tend to be viewed in such terms as crop yields and the number of agronomists, while issues such as income distribution, land tenure, and social and political reform have received only occasional lip service. Economists have been valued for justifying decisions already made by mission executives; other social scientists have been conspicuously absent from mission staffs.

Dr. Roett's book should enhance our understanding and awareness of the political implications of United States foreign assistance. Unfortunately, analyses such as Dr. Roett's, which question the simplistic, conservative approach of the U.S. AID, are likely to be ignored in the absence of a major restructuring of the entire foreign assistance program.

KENNETH D. FREDERICK

Resources for the Future, Inc.

A History of O.P.E.C. By Fuad Rouhani. (New York: Praeger Publishers, 1971. Pp. 281. \$17.50.)

In 1960 five major petroleum exporting states—Iran, Iraq, Kuwait, Saudi Arabia, and Venezuela—formed the Organization of Petroleum Exporting Countries (O.P.E.C.). Fuad Rouhani, the Organization's first Secretary General, gives a circumspect but clear description of O.P.E.C. in the last part of his book, and an excessively lengthy general discussion of the international petroleum industry in the opening hundred and fifty pages. He does not try to specify how much O.P.E.C., as opposed to other factors, has affected the bargaining power of the producing states.

For Rouhani "... the greatest value of the Organization to its members lies in its being a meeting place for regular consultations" (157). Despite a proclivity of the press and even members of the petroleum industry to talk about O.P.E.C. as if it were a genuine supranational entity Rouhani's position is correct. The Organization has a modest budget, which amounted in 1971 to only \$1.2 million. Its substantive actions are resolutions requiring unanimous consent addressed to its members or the operating companies. There are no provisions for sanctions against members that ignore resolutions. Any significance the Organization has must be attributed to facilitating the exchange of information and coordinating expectations.

O.P.E.C. has played an explicit role in two important developments since its founding:

halting a drop in posted prices and changing the tax treatment of royalties. In the late 1950s the major petroleum companies began to reduce the posted price used to calculate payments to producing countries. The prospect of falling per-barrel earnings led to the creation of O.P.E.C. In the mid-1960s the companies agreed to hold posted prices above levels prevailing at the end of the previous decade. Before 1966 Middle East countries allowed companies to write off royalty payments against their income taxes. In 1962 O.P.E.C. passed a resolution recommending that royalties be treated as a business expense deducted from earnings and not subtracted from tax payments. By 1971 the companies were operating in accordance with this resolution.

What is not clear from Rouhani's treatment is whether the existence of O.P.E.C. affected these developments. He notes that structural changes benefiting the producing states such as greater technical knowledge, increased capital resources, and the entrance of new firms into the market, have taken place in recent years. Raymond Vernon has maintained that such shifts typify raw materials industries and enable producing states to secure greater revenues over time. Rouhani sees market conditions as the principle explanation for the huge revenue increases secured by the producing states in 1970 and 1971. Economic arguments of this nature imply that O.P.E.C. at most affected only questions of timing.

Rouhani points out, although not with enough emphasis, that the greatest potential problem for the producing countries is the erosion of oligopoly market control now provided by the major oil companies. While O.P.E.C. has passed resolutions calling for production regulation by producing states, absolutely no joint action has been taken. The companies continue to set the overall level of production and to allocate it among producing areas. This allows O.P.E.C. members to bargain against the concessionaires and not among themselves. If nationalizations or resistance from consuming states erode the oligopoly O.P.E.C., the energy crisis, and the existing price structure will all disappear.

STEPHEN D. KRASNER

Harvard University

India's Use of Force in Goa. By Arthur G. Rubinoff. (Bombay: Popular Prakashan, 1971. Distr., New York: Humanities Press. Pp. x, 134. \$6.00.)

Rubinoff's study is an objective and empirically based analysis of the issue of Indian mili-

tary takeover of Goa in late 1961. The author has quite rigorously examined the Goa problem in the context of India's commitment to what are seen as two directly conflicting roles or self-images: a professed desire to settle international disputes by peaceful means, and leadership of the anticolonial struggle along with championship of the newly emerged nations. Professor Rubinoff has surveyed the fourteen-year period during which India attempted to settle the problem peacefully, and he has analyzed the external pressure from the more militant Afro-Asian nations which, in his view, finally persuaded India to opt for the more forceful image preferred by these states. He deals with what he calls "misunderstandings" in the West regarding India's commitment to peaceful methods, and clarifies the dilemma for Nehru in choosing between the available alternatives to rid India of the last foothold of colonialism.

Having outlined the basic arguments in the brief introductory chapter, the author (somewhat formalistically) explicates the "nature" and "principles" of Indian foreign policy in the second chapter. Chapters III-V deal with the more substantive aspects of the Goa issue, India's efforts at peaceful resolution of the dispute, and Nehru's ultimate decision to use force. The concluding chapter recapitulates the main arguments and provides more narrative dealing with additional factors impinging upon the decision to use force: V. K. Krishna Menon's upcoming election in North Bombay, India's (retrospectively unjustified) fear of NATO's reaction, and calculations *vis-à-vis* China and Pakistan. A sizable bibliography and an index are included.

The thesis that emerges from the book is that although Nehru's India had cultivated the image of world's foremost advocate of peaceful settlement of international disputes, in practice, it had sought to rely upon "minimum use of force—not complete non-violence" (p. 23) in achieving its foreign policy goals. India's commitment to resolve the Goa issue peacefully was exploited by the Portuguese (p. 110). Nehru maintained this commitment until 1961 despite widespread domestic sentiment for a more militant posture toward Portugal, and despite Portuguese firings which resulted in twenty *satyagrahis* killed and two hundred injured in August 1955. Although Nehru had initiated a shift in India's policy toward *possible* use of force in Goa in mid-August, 1961, it was the pressure from militant Afro-Asian states at the Belgrade Conference of nonaligned nations, and particularly from the African states at the

subsequent seminar under the Indian Council of Africa in New Delhi, that brought about a "profound change" in Nehru's policy toward Goa (p. 84). Thereafter, Nehru talked of "other methods" (p. 83) to solve the problem, and the Indian press (with the government's complicity) embarked on a "clumsy" campaign to make it appear that Portugal was provoking India (p. 85). Menon's impatience, urgings by the Praja Socialist and the Communist Party for immediate invasion, and electoral considerations for the Congress Party in the approaching third general elections also contributed to Nehru's eventual decision to use force. The Western nations, particularly the United States and Great Britain, and the press joined the criticism against Nehru's India, clothing the issue in moral and personal terms rather than considering the merits of the case.

The conclusions in the book are, on balance, favorable to India's decision to use force in Goa. The author is critical of India's poor timing of the decision—which made it appear that India was simultaneously the peacemaker in the Congo and the aggressor in Goa. He maintains that although India had a great many legitimate claims to Goa, it discredited itself by fabricating alleged Portuguese atrocities before the invasion. Nehru's characteristic indecisiveness and failure to gather around him trustworthy men resulted in distortions and delays in the execution of his decision to use force. Ironically, the author observes, India's annexation of Goa neither served to stem its declining influence among some Afro-Asian countries, nor did it directly assist the struggles for freedom in Angola, Portuguese Guinea, and Mozambique. It did, however, prove that India had not unconditionally forsworn the use of force; and that its policy had never been rigidly tied to peaceful methods. After Goa, India could no longer claim a special status with respect to peaceful methods.

My main criticism of this book relates to the discussion of nonalignment in Chapter II, which could have been more rigorous—thus avoiding the occasional confusion between the concepts of neutrality and non-alignment (pp. 18, 76, and 77). The study, as a whole, could also have benefited from a more systematic analysis of various factors affecting India's decision to use force. There are some minor errors/oversights in the work, such as references to Kerala (rather than Junagadh) as an instance of India's use of force (pp. 2 and 113) and depiction of Indians as a "race" (pp. 25 and 32). The book is a competent analysis of the Goa issue, and a notable contribution to the

literature on Indian foreign policy as well as international relations in general.

MUKUND G. UNTAWALE

University of California, Berkeley

International Law and Order. By Georg Schwarzenberger. (New York: Praeger Publishers, 1971. Pp. 298. \$17.50.)

This collection of essays by the distinguished British jurist, Professor Georg Schwarzenberger, examines various facets of international legal development in an era, as the author sees it, of increasing international lawlessness. Some of these facets reveal substantive problems such as the growth of terrorism, the revival of sovereignty, and the development of nuclear weapons. Others indicate procedural questions of interest to political scientists and students of legal philosophy. Among these are the second chapter on "Law, Order and Legitimation" and the closing chapter on "International Images and Models." The latter chapter is particularly stimulating in harnessing to legal analysis such wisdom and perspective as scholarship owes to Merleau-Ponty and R. D. Laing.

Professor Schwarzenberger, despite [or possibly because] of his interest in phenomenology and the sociology of law is scarcely a trendy legal authority. At times his views verge on the English curmudgeonly as when he speaks of "flower children, drug addicts and other exuberances of an indulgent society" and of "the part played by a liberal or lax application of law in hastening the decay of civilization." Moreover, he insists on a strictly formal distinction between "order" and "law," which is inevitably at variance with the prevailing trend of social research in the U.S. legal community. Fair enough. But, of course, while this preference for structured categories makes for clarity, it also makes inevitable his conclusion that international law is on the wane. In the international community, international law in the Austinian sense, or even in the Rousseauian, is of relatively minor importance. On the other hand, there is a great deal of structured, orderly behavior in relations between states which depends on shared reciprocal expectations and systems analysis. This systemic or, in Schwarzenberger's phrase, "consensual type of legitimation" of orderly behavior brings about a synthetic condition in international relations which is neither purely law nor purely order. Perhaps the international community reflects not chaos and the breakdown of law so much as a shrewd rejection of rules-for-their-own-sake. Sovereign immunity, for example, is a "law" whose time has gone past, as has much "law" on expropria-

tion of alien property; but the net standing of the legal system cannot really be measured by formal, uniform adherence to such time-honored precepts. The real question is whether the world legal culture (a term Professor Schwarzenberger would not, I suspect, willingly embrace) can provide those it serves—the political and business cultures—with adequate tools to achieve those levels of cooperation and mutual adjustment to which they aspire. The post-World War II era by this standard has perhaps not done so badly, at least in comparison with the period after World War I.

The author's impatience with what he considers soft legal thinking, especially his warnings against such self-inflating concepts as *jus cogens* reflect the British view that public policy is an unruly horse. Professor Schwarzenberger is quite right to warn us that "in any system of power politics in disguise, apparent 'progressiveness' can readily be made to serve hidden sectional interests." Yet the history of the World Court during the past two decades would suggest that it is dying of rigid legalism and narrow interpretation rather than of a surfeit of broad and flexible lawmaking. Apt, too, is the author's warning that proposals *de lege ferenda* concerning terrorism and guerrillas might be disguises for the disintegration of international law. However, the chapter on terrorists, etc., while emphasizing that the growth of random or revolutionary violence endangers the future of law, order, and civilization itself, does not point the way out of the conundrum of increasing confrontation between the violence practiced in the name of law and the violence practiced against the law. The author urges that we "should think less in terms of ideological commitments and temptations to be fashionable than in helping human beings in need of assistance" (p. 233). But if we walk with him along this path it leads us only to his rather modest recommendation:

... raising the international status and immunities of the delegates of the International Red Cross; securing for such delegates greater freedom of access to privileged and unprivileged prisoners anywhere; extending the freedom of communication between the regional and Geneva headquarters of the International Committee of the Red Cross, and providing long-term financial assistance on a more commensurate scale. Such a policy would probably yield better dividends in terms of diminishing human misery and cruelty than, on the surface, more grandiose schemes and humanitarian rhetoric (p. 234).

But the author, whose excellent chapter on hidden agendas, values, motives, models, and im-

ages qualifies everything else he says, certainly appreciates that the Red Cross is not about to be accepted as a substitute for a fundamental reordering of human priorities and of the institutional instruments by which both law and order are achieved. Thus the Schwarzenberger model of international order, and of the role of law in order creation, assumes that the existing, status quo-oriented legal culture can develop a capacity for systematic internal change and reform, which the author's empirical evidence denies.

In short, disorder may be better than bad order, lawlessness may be preferable to stultified law. Professor Schwarzenberger acknowledges this. He does not, however, appear ready to accept that lawlessness and disorder may be the law and order of rapid, transitional change, subject to its own internal reciprocal code of conduct and ameliorating norms worthy of study as "law."

International Law and Order is the sort of book which I absorbed while moving my lips, not because I am a handicapped reader but because I found myself discussing, arguing, and not infrequently, emphatically agreeing with this brilliant, provocative, and witty author.

THOMAS M. FRANCK

New York University

The Rise of Free Trade Imperialism. By Bernard Semmel. (Cambridge: Cambridge University Press, 1970. Pp. 250. \$11.00.)

In this book, his third on British imperialism, Professor Semmel traces the intellectual origins of late nineteenth-century British imperialism to the theories which supported the two "forms" of the mid-Victorian British "Empire of Free Trade" (p. 8). The first of these "theories . . . of capitalist imperialism" (p. 211) viewed England as "the Workshop of the World," the wielder of an "informal dominion by virtue of her industrial monopoly. . . ." The second, represented most fully by Edward Gibbon Wakefield and supported by the Radical Colonial Reformers, stressed Britain's more "formal" Colonial empire (p. 8). For Wakefield, free trade was necessary but not sufficient. He thought that only a "program of systematic colonialization" could alleviate the "glut of goods, of capital and of men" (p. 76) which plagued the capitalist industrial order. Semmel makes a convincing case that Wakefield had a "theory of capitalist imperialism" (p. 212) that anticipated in some respects that of the neo-Marxists such as Luxemburg and Lenin.

At the other extreme of Radical opinion were those who became, after 1850, the leading

spokesmen of Radicalism, the pacifistic, cosmopolitan Cobdenites who, in spite of their nationalistic and mercantilistic lapses, were not, Semmel apparently concludes, especially imperialistic. To establish that there was, strictly speaking, a Free Trade Imperialism during this period, Semmel must show that the "orthodox" (p. 11) Radical Free Traders who rejected both colonization and Cobdenite cosmopolitanism, men like Joseph Hume and Lord Brougham, were supporters of a Free Trade Empire.

Although the author displays great knowledge of the economic thought and controversies of the period and considerable ability to distinguish clearly the various schools of Radical Free Trade opinion, he does not make a fully convincing case that the commitment of this middle school of Radical opinion to free trade was in itself also a commitment to empire. Professor Semmel fails to make his case largely because his book, despite its impressive scholarship, is not ordered by a precise, well-argued view of what constitutes imperialism. He seems to reject the view that a free trade policy is necessarily imperialistic, or that it was imperialistic due to the great disparity between the industrial development of England and that of her trading partners. The basic, but largely unexamined assumption of his argument is that the anti-colonial Free Traders were imperialistic because they desired to preserve and extend the "industrial predominance" (p. 149) of England, to strengthen her position as the "Workshop of the World." But since he does not argue that a strict free trade policy necessarily, or as its leading proponents understood it, involved control over, exploitation of, or large capital exports to foreign nations, it is not clear why such an economic policy is imperialistic.

Some of the evidence cited, but not adequately discussed, in this book indicates that many Free Traders combined an economic policy of expansive free trade with a political commitment to empire, i.e., to making Britain predominant in power and prestige. By essentially confining himself to a history of economic thought and policy, Professor Semmel has been prevented from giving us a full account of the instances of mid-Victorian imperialism which he has uncovered.

In his perceptive final chapter it becomes clear that, although he disagrees with Hobson's and Schumpeter's view that "imperialism was thoroughly out of line with the temper of capitalism in its classic period," (p. 217) Professor Semmel basically agrees with them that capitalism is not inevitably imperialistic. If the Free Traders had understood, as Hobson did, that a

more "equitable distribution of national income" provides an internal solution to the problem of capitalist glut they could have combined a modest free trade policy with one of income redistribution. The equalitarian welfare state has ended the need for capitalist imperialism.

Bowdoin College

Western Technology and Soviet Economic Development: 1917 to 1930. By Antony C. Sutton. (Stanford, Calif.: Hoover Institution Publications, 1968. P. 381.)

This is a delightful book for those who like anachronistic museum pieces breathing the fiery spirit of the Cold War of the 1950s. Sutton's basic hypothesis is "that Soviet economic development for 1917-1930 was essentially dependent on Western technological aid" (p. 283). Chapters 2 through 15 of the book are long and tedious discussions of each major industry designed to convince the reader that this is so. Chapter 2 asserts that the Caucasus oil fields were totally dependent on Western technological aid for development in the 1920s.

The same assertion is made for the coal and anthracite mining industries (Chapter 3), the metallurgical industries (Chapter 4), the non-ferrous metal mining and smelting industries (Chapter 5), gold mining, platinum, and asbestos (Chapter 6), agriculture (Chapter 7), fishing, hunting, and canning (Chapter 8), lumbering (Chapter 9), machine building (Chapter 10), electricity and electrical equipment (Chapter 11), chemical, gas, and dye industries (Chapter 12), food, clothing, and housing industries (Chapter 13), transportation and transport equipment (Chapter 14), and military production (Chapter 15).

There is very little pretense of objectivity in this polemic. Although a great deal of "evidence" is presented, none of it is comprehensive, and all of it falls into the category of casual empiricism. Sutton's main sources of data are the U.S. State Department, the German Foreign Ministry, and Oberkommando der Wehrmacht (and an "economic analysis" by Scotland Yard!—p. 295). Thus, even the "facts" are suspect since the natural bias of the official U.S. and German Archives would certainly be toward overemphasis on the degree of their contributions to Soviet development.

It must also be noted that Sutton's is a peculiar use of the "aid" concept, since the capitalist governments all did their best to prevent any trade of any sort with the Soviet Union in the early years—and only the greed of individual

capitalists broke through that barrier. This "aid," therefore, was not gifts to the Soviet Union, but very carefully drawn commercial agreements, paid for by precious foreign currency.

Of course, the Soviet Union was a backward country before the revolution, and did borrow much technology from the West, mostly bought and paid for through the nose. But Sutton goes much further, pushing the point in an exaggerated rhetoric: "The Western contribution to Soviet production between 1917 and 1930 was total. No important process has been isolated which was not a West-to-East transfer" (p. 340). Of course, where else would they have found the technology in those days? The trouble is that Sutton implies from that truism that the main efforts to rebuild and expand the Soviet economy came from Western capitalists rather than the Soviet people. One should rather emphasize that their sacrifices were bitter and hard to take, beginning with the vast amount of agricultural produce that had to be exported to pay for Western machinery and technology (and ending with the Stalinist dictatorship that enforced these sacrifices).

In order to show that the Bolsheviks and the Soviet people did nothing, and foreigners did everything, Sutton totally rewrites history in several other respects. First, he argues that Tsarist Russia wasn't so bad, that it was really quite developed economically (p. 345). Yet this was a country that had almost all the characteristics we currently associate with underdeveloped countries: more than 80 per cent of the population was rural and agricultural and illiterate, most of the small amount of modern industry was owned and run by foreigners, and the transportation network was tiny and inefficient.

Second, Sutton admits that most experts have always thought that the collapse of Russian industry in 1917-1922 was due to World War I, the effect of two revolutions, many peasant uprisings, the anti-Bolshevik military intervention by 14 foreign capitalist powers including the United States, and the Civil War fought by all the forces of the counter-revolution. (See, e.g., Howard Sherman, *The Soviet Economy* [Boston: Little, Brown, 1969], chapter 3.) But he airily dismisses these minor dislocations. Instead, he claims: "The basic cause for the collapse was the economic illiteracy of an ideology which had neglected to think out its economic counterpart and drove a viable growing economy into a shambles" (p. 310). Thus, he finds that socialism caused the catastrophic decline, while foreign capitalists produced the re-

covery. One might wonder, though, just what kind of "viable growing economy" could exist in the midst of a world war, two revolutions, Civil War, and foreign intervention—even assuming the best possible economic ideology?

In emphasizing the importance of Western benevolence, he does modestly admit that technology is not the "only factor in economic development. Political, social, and psychological factors play their respective roles. This interplay is particularly interesting in the Soviet example but is, unfortunately, outside the scope of this study" (p. 4). Since he doesn't hesitate to make broad generalizations about many political events, this is a strange modesty. It simply gives him an out from considering the main trouble with his thesis. Soviet industrialization involved not only the importation of a minor amount of foreign machinery and technology; it also involved a major change of the society from capitalism to socialism and planning.

Many other underdeveloped countries have received large amounts of foreign investment and large amounts of free aid in the half-century since the Soviet Union began its industrialization. Why have none of these been successful? Why are India and Pakistan and Africa and Latin America still at abysmally low levels, while the Soviet Union is the world's second industrial power? Does this have something to do with the difference between capitalism and socialism? How did this one underdeveloped country achieve success with only minor foreign imports whereas others have so far failed with major foreign imports including free aid? Not only was the Soviet Union socialist economically, but there is also the fact (which Sutton clearly doesn't like) that it confiscated foreign capital, whereas all the others allowed continued imperialist domination.

In addition to the major thesis of the book, several other aspects reveal the author's bias. At several points in the book, Sutton seems to imply that it is a bad thing that the United States ever decided to allow any trade with the Soviet Union, and he hints at support for U.S. government restrictions on Soviet trade. Second, and closely related, he slanders all the American capitalists who participated in early trade agreements with the USSR. Thus, it turns out (on the sole basis of State Department files) that Charles H. Smith was "more or less" a Soviet agent (p. 284) as was Julius Hammer, and Ludwig Martens, and several others who wanted trade with the Soviet Union. It sounds more like a CIA fairy tale than a scholarly study.

Finally, based again mainly on "unbiased"

State Department files, he convicts most of the Soviet leaders of personal corruption in relation to the foreign concessions, including here slanderous attacks on Trotsky, Zinoviev, Chicherin, and Dzerzhinsky (p. 308). Moreover, just to show no bias against Trotsky, he also tosses in an attack (on the basis of no evidence whatsoever) on the personal corruption of Stalin and all the Soviet leadership of the later period as well (p. 309).

HOWARD J. SHERMAN

University of California, Riverside

Congress, the Executive, and Foreign Policy.

By Francis O. Wilcox. (New York: Harper & Row, 1971. Pp. 179. \$5.95.)

Francis Wilcox has produced the fair-minded study of the American foreign-policy process that one might have expected from an able scholar with substantial experience on both the legislative and the executive sides of that process. His treatment is pragmatic and constructive, with a dash of wit and much of that wisdom which derives from mature appreciation of the complexities of the process and tolerant understanding of the foibles and frailties of those involved in it.

Wilcox refrains from invoking abstract principles, simplistic slogans, or legalistic formulas pertaining to executive-legislative relations in the foreign-policy field. He offers several much-needed reminders: that debates concerning the legal competence of the two branches more often reflect substantive disagreement than differences in constitutional interpretation; that congressional inclinations regarding foreign policy are not uniformly or consistently more (or less) moderate, constructive, or "liberal" than those of the executive branch; that making policy conform to the "people's will" is not a simple matter of honoring the wishes of Congress, following the judgment of the president, acceding to the demands of articulate groups, or interpreting the results of elections or public opinion polls; and that somewhere between the extremes of tying the hands of the president and giving him a free hand lies our chance to secure essential presidential leadership.

Though the author insists, and this reviewer agrees, that the breakdown of consensus about the American role in the world is more the cause than the effect of controversy about the proper place of Congress in the making of foreign policy, he attaches great importance to the development of more meaningful consultation between executive and legislative branches and to the cultivation of a congressional involve-

ment that can provide both independent criticism of and helpful support for executive ventures in world affairs. He is even-handed in apportioning blame for the present unfortunate state of interbranch relationships: the executive too often treats the Congress as a nuisance or an object of salesmanship, while legislators are frequently less disposed to consult about the making of policy than to interfere in its execution, unreliable in respecting legitimate needs for secrecy, and unwilling to share responsibility, when things go wrong, for policies that they have previously supported. The take-off/forced landing syndrome looms large in the current unpleasantness. The president is more interested in involving Congress in the potential forced landing than in the take-off, the Congress wishes to participate in the take-off but to remain aloof from any possible forced landing; and neither is likely to concede to the one-sided preference of the other. Wilcox is wisely concerned with *what* as well as *whom* to blame for the recurrent failure of the two branches to collaborate effectively. He treats inherent features of our governmental system and of international politics along with the failings of presidents, bureaucrats, congressmen, and representatives of the media as sources of difficulty in the conduct of foreign relations.

Consensus is essential for effective foreign policy, but the right to dissent and the right to change one's mind are also high values in a democratic society. The most thorough consultation may not produce consensus, and the consensual foundations of policy may dissolve at critical moments. What should be done when consensus cannot be reached, or when it falls apart? The duty of statesmen to act in accordance with what they regard as the state's basic necessities, and their obligation to perform responsibly even when the going gets rough are no less fundamental than the rights to withhold and to withdraw support from policy. The urgency of rebuilding consensus should be recognized, but so should the necessity of carrying on American foreign relations when consensus does not exist. If the peculiar merit of Congress is responsiveness to the popular will, that of the president is willingness to bear responsibility for the conduct of foreign relations. The ideal must be to blend responsiveness and responsibility. Wilcox has obviously given deep thought, and his book stimulates the reader to give deep thought, to the perplexing problems of achieving that ideal.

Registry of Retired Professors

The Association has established a Registry of Retired Professors. The Registry serves as an information exchange for those retired professors who are willing to teach one or more courses on a one-semester or one-year basis, and those institutions desiring to make such appointments. Any retired professor wishing to be listed in the Registry should contact the Association to receive an application form. Departmental chairmen wishing to inquire about the availability of retired professors in a certain specialty or geographic area should write specifying their requirements.

THE AMERICAN POLITICAL SCIENCE ASSOCIATION

PERSONNEL SERVICE

The American Political Science Association's Personnel Service operates as a clearinghouse, bringing together political scientists seeking positions and prospective employers. Registration in the service is open to members of the Association and to Political Science Departments. Membership in the Service, which includes a subscription to the monthly Newsletter, is \$6.00 per year. Membership in the Credential Referral Service of the Personnel Service is an additional \$8.00.

NEWSLETTER

A Newsletter, listing openings for political scientists including teaching, administrative and research openings, is mailed monthly to all Personnel Service members. Positions are listed by institution with a brief description of each opening.

CREDENTIAL REFERRAL SERVICE

A file will be maintained at the Association office for all members of the Credential Referral Service. This file will include a résumé, a dissertation abstract and/or a list of publications, and up to three letters of reference for each member. Referrals are made upon the request of a member or of an institution.

EMPLOYERS USING THE SERVICE

The Association's Council has adopted a policy that it is a professional obligation of all political science departments to list publicly all vacancies in the APSA Personnel Service Newsletter for which they are recruiting except those vacancies at the association and full professor levels which departments expect to fill from among people known to them. There is no cost to the institution listing its vacancies with the Service. Forms for listing openings in the Newsletter are available from the Personnel Service.

For further information concerning the Personnel Service write to:

Director, Personnel Service

1527 New Hampshire Avenue, N.W.
Washington, D.C. 20036

The International Political Science Association Invitation to Membership—1973

The International Political Science Association welcomes political scientists as members. The Association, founded in 1949, is composed of three categories of members: individuals, institutions and national associations.

Membership in the Association of \$4.00 a year entitles members to receive the Newsletter giving information about IPSA activities and meetings; to purchase material published under IPSA auspices—including the *International Bibliography of Political Science*, published annually by Stevens in London and sets of papers submitted at IPSA meetings at reduced cost; and to register at IPSA meetings at lower rates.

Individual members who pay a higher membership fee of \$12.00 a year are, in addition, entitled to receive either the *International Political Science Abstracts* published bi-monthly by the Association itself or the *International Social Science Journal*, the quarterly organ of the Department of Social Sciences of UNESCO. To join the Association send your name and check to the International Political Science Association, 27 rue Saint Guillaume, Paris 7e, France.

LONG-TERM PROJECTIONS OF POWER: POLITICAL, ECONOMIC AND MILITARY FORECASTING

Oskar Morgenstern, *New York University*, Klaus Knorr, *Princeton University* and Klaus Heiss, *Princeton University*

Offers projections of the future, to approximately the year 2000, and examines how these projections may be relevant for guiding research and development in technology for the future environment.

0-88410-008-1 192 pp. October \$9.50

THE GOVERNMENT AND THE MULTINATIONAL FIRM

John Fayerweather, *editor, New York University*

Leading international businessmen and academics offer a comprehensive analysis of current thinking about the varied facets of relations between multinational firms and governments.

0-88410-256-4 144 pp. November \$12.50

MINORITY ENTERPRISE AND THE PRESIDENT'S COUNCIL

Anne Huff & Samuel I. Doctors, *Northwestern University*

One component for increased minority participation in the American economy is the President's Advisory Council for Minority Business Enterprise. Doctors and Huff consider the need for PACMBE, outline a detailed plan for minority participation, and look at PACMBE as an example of the presidential advisory process.

0-8410-002-2 192 pp. October \$12.50

FEDERAL REVENUE SHARING AND THE CITIES

Ray D. Whitman, *University of Maryland*

The first full length economic analysis of revenue sharing, offering a history of the revenue sharing proposal, an analysis of the theoretical framework of the proposal, an interpretation of the fiscal and socio-economic data which bear on the need for and distribution of funds, and studies the effect of revenue sharing on federal, state and local governments. 0-88410-250-5 285 pp. December \$15.00

POLITICAL ECONOMICS OF RURAL POVERTY IN THE SOUTH

Arthur M. Ford, *S. Illinois University*, Introduction by Robert L. Heilbroner

An approach to the study of poverty which rejects the traditional socio-economic views of poverty that hold "cultural deviation" as its cause. Concludes that a new method is needed to understand the phenomenon, one which comes to grips with the nature and use of power. 0-88410-005-7 128 pp. September \$10.00

CLEARING THE AIR: FEDERAL POLICY ON AUTOMOTIVE EMISSIONS CONTROL

Henry D. Jacoby, *MIT*, John Steinbruner, *Harvard University*

A policy analysis focusing on the series of decisions that now face the government in carrying out its policy on emissions control. Considers the major dimensions of the decisions, develops alternatives to the current policy, and compares the options in terms of their cost and effect on the pollution problem.

0-88410-301-3 288 pp. October \$15.00

ADMINISTRATIVE ALTERNATIVES IN DEVELOPMENT ASSISTANCE

Gary S. Posz, *U.S. Department of State*, Jong S. Jun, *California State University of Hayward*, and William B. Storm, *University of Southern California*

Based on extensive interviews with overseas technical personnel of the U.S. Agency for International Development and review of the pertinent literature the authors draw specific conclusions about the effectiveness of AID and offer an application of contemporary organization theory to the problem of constructing a new strategy for world development. 0-88410-004-9 128 pp. September \$10.00

OIL AND THE OUTER COASTAL SHELF: THE GEORGES BANK CASE

Foreword by Richard Neustadt

William R. Ahern, *Harvard University*

Deals with the need for more oil and the possibility of off-shore drilling on the Georges Bank. Compares the risks to the environment of drilling as opposed to the uses of tankers and deep-water ports, the costs to consumers, and the technological and geological problems of off-shore drilling.

0-88410-303-x December \$10.00

THE DYNAMICS OF POPULATION POLICY IN LATIN AMERICA

edited by Terry L. McCoy, *Ohio State University*

A comprehensive analysis of contemporary population policies and programs dealing with fertility and growth. The contributors examine the factors that shape governmental and societal responses to the population challenge and study the actual policies of Columbia, Costa Rica, Chile, Peru, Mexico, Dominican Republic, and Venezuela. 0-88410-350-1 320 pp. October \$15.00

PSRO: ORGANIZATION FOR REGIONAL PEER REVIEW

Barry Decker, M.D. & Paul Bonner, *Arthur D. Little, Inc.*

Develops conceptual models for the structure and function of prototype Professional Standards Review Organizations as described in the Social Security Amendments of 1972. Review of the pertinent literature and analyzes existing approaches to medical care appraisal. Includes a restatement in non-legal terms of the PSRO legislation. 0-88410-105-3 384 pp. September \$15.00

**Political Alienation and
Political Behavior.**
David Schwartz
(Rutgers).

This work presents the causes for political alienation and the results of alienation in behavioral patterns. He challenges accepted theories of social status and economic difficulties and develops a completely new three-variable psychological theory based on the following observations: threat from value conflict, perceived personal inefficacy, and perceived systemic inefficacy. His theory includes a process model for predicting political behavior. 368pp. \$9.95

Housing Urban America.
Jon Pynoos, Chester Hartman,
(Pynoos and Schafer: Joint Center
For Urban Studies, Cambridge, Mass.
Hartman: Institute For Urban And
Regional Development, University
of California.)

This interdisciplinary reader of over fifty articles focuses on the analysis of the multidimensional aspects of housing. These three experts in the field of urban planning have edited articles from the '1960's and '1970's, several of which were written specifically for this volume, with interest in the economic, social, and political factors that account for poor housing and provide policies and strategies that may be brought to bear to improve conditions in these areas. Discoveries for better understanding are provided in housing, markets, the production of its services and the distribution of housing, over the population. A balanced housing analysis is supplied between theory, empirical verification and policy. The five sections of the book are: politics, social aspects, economics, production, and policies and programs. The bibliography contains a selective list of post 1960 articles and books plus important earlier works. 682pp. \$25.00

**Mathematics Of
Collective Action.**

James Coleman (Johns
Hopkins University).
Besides discussing the
general behavioral per-
spectives of the causal
process and that of
purpose, the author
provides new develop-
ments in mathematical
sociology. He introduces
the formal decisions to
collective decisions with
social scientists with
new theoretical prin-
ciples on collective
decisions. 204pp. \$9.75

**The Unesco
International
Bibliography of
Political Science 1971.**

This annual work is now
available and provides
information on all
important aspects of
political science in inter-
national literature. It's
a vital element for a
complete reference
library. Prepared by the
International Committee
for Social Sciences
Documentation.
\$15.00 Cloth.

Rules And Law In Sociology.

Robert Brown (Australian National
University).
Four main elements in sociological
investigation are discussed: defini-
tions, properties, generalizations,
explanations and conclusions. Every
social scientist and some philosophers
must cope with the problems which
these topics raise. He attempts to
clarify the consequences for both
sociological generalizations and
explanation, of the adoption of certain
kinds of definitions or of utilizing cer-
tain sorts of properties. 192pp. \$7.95

KEEP UP TO DATE
IN THE POLITICAL WORLD...

BILL OF RIGHTS READER

5th Edition—1973, Revised

Edited by MILTON R. KONVITZ. Revised once again, this well-known book remains a comprehensive, up-to-date survey of the ways in which the freedoms guaranteed by the Bill of Rights have been interpreted by the Supreme Court. Forty-eight new cases are included on such currently pertinent topics as the Pentagon papers, the death penalty, the so-called parochial legislation, the rights of prisoners and of the poor, and some affirmative action aspects of school desegregation.

\$19.50

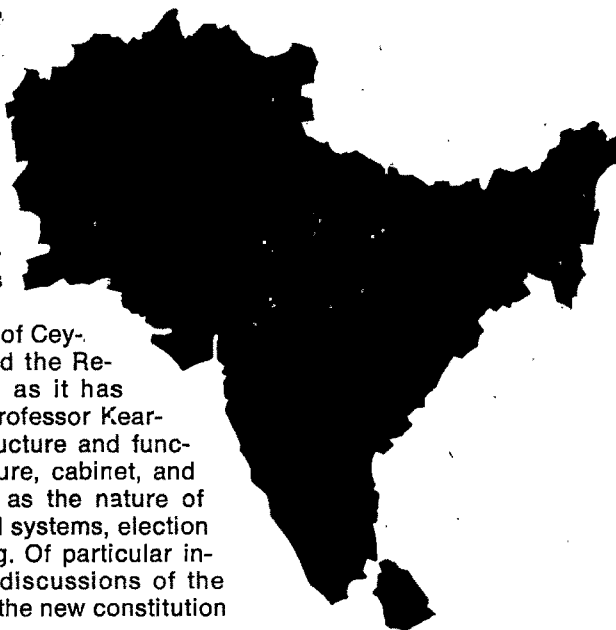

THE POLITICS OF CEYLON

**(SRI LANKA) by
ROBERT N. KEARNEY**

Focusing on institutional change and adaptation to modernization, this book offers a systematic analysis of the political system of Ceylon (recently renamed the Republic of Sri Lanka) as it has evolved since 1948. Professor Kearney examines the structure and functioning of the legislature, cabinet, and bureaucracy, as well as the nature of the party and electoral systems, election campaigns, and voting. Of particular interest are extended discussions of the 1971 insurrection and the new constitution adopted in 1972.

BEHAVIORAL PERSPECTIVES ON AMERICAN POLITICS

RALPH M. GOLDMAN, *California State University, San Francisco*

Analyzes the major institutions of American national government from the perspectives suggested by a number of behavioral science concepts, such as linguistics, organization theory, communication, decision making, yet presents traditional American politics material. \$5.95 / Paperback

AN INTRODUCTION TO SYSTEMATIC POLITICAL SCIENCE

DAVID H. EVERSON, *Sangamon State University*, and JOANN P. PAINE, *Southern Illinois University*

Introduces students to the basic concepts of political science at the introductory level, rather than waiting until upper division courses. Focuses on how to *think* about politics. \$5.95 / Paperback

PUBLIC OPINION: MICRO AND MACRO

JAMES J. BEST, *University of Washington*

Examines public opinion from an individual perspective as well as a societal phenomenon. A comprehensive review and critique of the relevant literature in the field. \$4.95 / Paperback

AMERICAN FOREIGN POLICY: Response to a Sense of Threat

HENRY T. NASH, *Hollins College*

America's military response to the threat of Communism since World War II has determined foreign policy since that time. Analyzes this response, and examines policy changes through the Strategic Arms Limitations Talks. \$4.95 / Paperback

CASES ON CONSTITUTIONAL LAW: Political Roles of the Supreme Court

VICTOR G. ROSENBLUM, *Northwestern University*, and A. DIDRICK CASTBERG, *California State University, Los Angeles*

Covers the political relationships between the Supreme Court and other branches of government, as well as the people and state and local government. Cases preserve as much of the original decision as possible. \$12.00

For examination copies write:

THE DORSEY PRESS
Homewood, Illinois 60430

REFORM RULE IN CZECHOSLOVAKIA

The Dubcek Era 1968-1969

GALIA GOLAN

"Dr. Golan weaves together an impressive amount of relevant information from Czechoslovak sources in an illuminating, in-depth account of the political and intellectual drama, and provides a scholarly, sensitive interpretation of the Czechoslovak experiment in reform politics." —*Perspective*. A sequel to Dr. Golan's *The Czechoslovak Reform Movement* (1971). \$18.50

THE SCOTTISH POLITICAL SYSTEM

JAMES G. KELLAS

"This book fulfills a longstanding need. It challenges the conventional view of Britain as a unitary, homogeneous polity by convincingly demonstrating the existence of a distinct Scottish political system. This has important implications for the study of British government generally." —*Library Journal* Cloth \$12.50 Paper \$4.45

THE DYNAMICS OF INDIAN POLITICAL FACTIONS

A Study of District Councils in the State of Maharashtra

MARY C. CARRAS

An analysis of factionalism in two rival groups within the dominant Congress Party. The study suggests that the factional behavior of some 160 councillors interviewed corresponds with national (or calculable) economic interests, thus challenging a common assumption that Indian political alignments are determined by factors such as personal, family or caste loyalties. \$19.50

THE PRICE OF LIBERTY

Personality and Politics in Colonial Nigeria

KENNETH W. J. POST and GEORGE D. JENKINS

An account of decolonization in Nigeria which is in part a biography of Adegoke Adelabu, describing both his public personality and the behind-the-scenes political operations. "Gives the reader a fine and vibrant sense of the rough and tumble of Nigerian politics." —*Perspective* \$27.50

Cambridge University Press

32 East 57th Street, New York, N.Y. 10022

BALFOUR: A POLITICAL BIOGRAPHY

SYDNEY H. ZEBEL

Professor Zebel examines the two distinct periods in Balfour's political career: the first covering his service as Chief Secretary for Ireland, Leader of the Conservative Party and Prime Minister; the second as First Lord of the Admiralty, Foreign Secretary and Lord President of the Council. "A fine work of scholarship . . . it greatly enhances our understanding of an important British politician."—*Library Journal*

\$14.95

TURGOT ON PROGRESS, SOCIOLOGY AND ECONOMICS

Translated and edited by RONALD L. MEEK

New translations of *The Successive Advances of the Human Mind*, *Reflections on the Formation and the Distribution of Wealth*, and *On Universal History*. Professor Meek's introduction analyzes the inter-relationship of Turgot's political, economic and sociological theories. *Cambridge Studies in the History and Theory of Politics*

\$12.50

JEAN BODIN AND THE RISE OF ABSOLUTIST THEORY

JULIAN H. FRANKLIN

"A major contribution to an understanding of Bodin's political ideas."—*Library Journal*. In this new study, Professor Franklin traces the development of Bodin's thought from the tentatively constitutionalist position expressed in his *Methodus* to the absolutist stand of the *Republique*, placing in perspective his influence on 17th-century absolutist doctrine.

\$8.95

TEACHERS' UNIONS AND INTEREST GROUP POLITICS

DAVID COATES

A study of the teachers' unions of England and Wales from 1915 to the 1960's. The author differentiates between questions of "behavior" and "influence" and relates the behavior of organized teachers to that of other interest groups.

Cloth \$10.95 · Paper \$4.50

Cambridge University Press

32 East 57th Street, New York, N.Y. 10022

Community Life Publications

CITIZEN PERSPECTIVES ON GOALS FOR GEORGIA by Dr. Tim C.

Ryles marks the advent of an exciting new series of publications examining community life in all its aspects. *COMMUNITY LIFE PUBLI-*

CATIONS is the title of the series being published under the auspices of the School of Urban Life at Georgia State University in Atlanta. The monographs of the series will come from the research of the School of Urban Life as its faculty and students apply academic theory to the urban community laboratory.

In this first volume Dr. Ryles, a political scientist, reports the results of a citizen attitude survey conducted through the Goals for Georgia Program. Dr. Ryles analyzes citizen attitudes toward public health, public education, economic development, social development, protection of persons and property, transportation, natural environment, and taxes and spending. The final two chapters have the provocative titles: "Political Efficacy: Do People Really Matter in Georgia Politics?" and "Followers' Perceptions of Leaders: Political Trust." The author includes the full text of the interview questionnaire in the appendices—as well as explanatory narrative and analysis of the data. The results provide a microcosm of citizen attitudes in the South if not in the nation.

Future volumes in the *Community Life Publications* series will continue to explore the citizen attitude theme as well as themes in such areas as land use and planning, public finance, urban history, and criminal justice systems.

Order this first volume (PRICE: \$5.00) and future volumes from:

FINANCING ELECTIONS

**The Politics of an
American Ruling Class**

David Nichols

No book in American political science has so incisively related the question of the class structure in American society to the electoral process and, of timely interest, to the way in which national elections are financed.
\$3.95 paperback (05553-1)
\$9.95 cloth (05352-0)

**THE GREAT NIXON
TURNAROUND:**

**America's New Foreign Policy
in the Post-Liberal Era**

Edited by Lloyd Gardner,
Rutgers University

Linking the sudden thaw in America's anti-communist policy to the troubled economic situation, Professor Gardner concludes that the Cold War was simply no longer capable of sustaining either America's power or her prosperity. He traces the softening of Nixon's anti-communist rhetoric, and shows why he was the right man to end a Cold War liberals began.
\$3.95 paperback (05551-5)

THE GOOD FIGHT

By Shirley Chisholm. What it was like to be the first black and first woman to run for President: her feelings about party factionalism, black and white conservatism, changing the status quo—and President Nixon. “An idealistic yet hard-headed testament mixing inside stories with hard-won human and political wisdom.”—*Publishers Weekly*. Illustrated. \$6.95

THE SECOND AMERICAN REVOLUTION

Some Personal Observations

By John D. Rockefeller 3rd. “One of the most penetrating studies on the American society and one of the most courageous.”—*U Thant* “A marvelous job of looking at the many sides of a very complex problem and analyzing them with admirable balance and encouraging optimism.”—*Edwin O. Reischauer*. \$6.50

LETTERS FROM PRISON BY ANTONIO GRAMSCI

Selected, translated, and introduced by Lynne Lawner. In English for the first time, these letters written during Gramsci's ten years in Fascist jails are “a magnificent introduction to the mind of the twentieth century's greatest Marxist thinker. They teach us how to live and—what comes to the same thing—how to die.”—*Eugene Genovese*. Illustrated. \$10.00

JOHN STRACHEY

By Hugh Thomas. A powerful biography of the brilliant, mercurial British politician and leftist spokesman who died in 1963. Mr. Thomas probes every aspect of his long and varied career, its reflections of leftwing politics in the war and depression-torn 1930s and 1940s, and of postwar British-American relations in the 1950s. Just published, \$8.50

EUROPE: THE RADICAL CHALLENGE

By Hugh Thomas. With uncommon good sense a major political writer looks hopefully toward a united Europe, exploring the problems of Britain's entry into the Common Market, the chances of federalism, the desirability of a unified defense policy, and possible relations with the United States and the Third World. “Wide-ranging and tersely written.”—*Roy Jenkins, British Labour Party*. \$8.50

HANDBOOK OF SOVIET SOCIAL SCIENCE DATA

Edited by Ellen Mickiewicz, Michigan State University

For the first time, the Western scholar can use Soviet data with confidence in its accuracy and exhaustiveness. This pioneering volume brings together massive amounts of data on demography, agriculture, production, health, housing, education, communication, and international interaction in Soviet Society. It is "a fundamentally important work of a kind and quality that has not been available before in the field of Soviet studies . . . a major step toward the possibility of true comparative and political analysis."—Karl W. Deutsch, Harvard University, from the Foreword

ELECTORAL BEHAVIOR: A Comparative Handbook

Edited by Richard Rose, University of Strathclyde,
Glasgow (with 14 contributors)

This indispensable reference book provides a systematic description and analysis of the relation between social structure, party systems and electoral behavior in major Western nations: the United States, Canada, Ireland, Britain, Germany, Italy, Australia, Norway, Sweden, Finland, the Netherlands, and Belgium.

1973

INTERNATIONAL THEORY AND EUROPEAN INTEGRATION

By Charles Pentland, Queens University, Ontario

This book is a sophisticated and thorough analysis of both theory at the international level and development at the level of European integration. Pluralist, functionalist, neofunctionalist, and federalist approaches are each examined in depth. The author determines not only the areas of compatibility but also the points of difference among these major approaches to integration theory.

New Books for a New Political Science

ARK II

Social Response to Environmental Imperatives

DENNIS PIRAGES, University of California, San Diego,
and PAUL R. EHRLICH, Stanford University

Written by a social scientist and a biologist, this book is intended to put the environmental crisis into social and political perspective and to make the subject of limits to growth understandable to students in the social sciences. The book is unique in its focus on the future and on possible social (as opposed to technological) solutions. Provocative supplementary reading for introductory courses in political science, sociology, economics, environmental studies, social ecology, and other areas.

Publication date: Winter 1973 Paperbound.

Power and Community in World Politics

BRUCE M. RUSSETT, Yale University

A collection of articles by one of the world's foremost authorities on macro-analysis of international affairs. Among the topics discussed are the changing nature of international politics, strategic and military policy, and efforts to develop a peaceful world. Excellent supplementary reading for all courses in international relations and for advanced courses in methodology.

Publication date: Winter 1973 Paper and cloth.

Strategy for a Living Revolution

GEORGE LAKEY

Here is the book that those who are interested in nonviolent social change have been searching for. Lakey, a prominent Quaker activist, is specific and concise and offers detailed suggestions for organized action.

"This book gives a clear understanding of nonviolence as an effective means for developing a mass movement for change and leaves no doubt about the hard work required to bring it about." —César Chavez

1973, 234 pages, paperbound, \$2.95

ARMS CONTROL

Readings from SCIENTIFIC AMERICAN

With Introductions by HERBERT F. YORK,
University of California, San Diego

Compiled and introduced by one of the most respected authorities in the field of arms control and disarmament, this collection of articles offers a broad introduction to arms control questions that have arisen since the second world war.

1973, 427 pages, 232 illustrations,
cloth \$12.00, paper \$5.95

Now available as a paperback:

BEYOND THE PUNITIVE SOCIETY

Operant Conditioning: Social and Political Aspects

Edited by HARVEY WHEELER, Center for the Study
of Democratic Institutions

A collection of diverse perspectives on the work of B. F. Skinner and its far-reaching political implications.

"We must decide how much credence to give Skinner's theories. I can imagine no better way to do this than to read the thoughtful evaluations from some of today's leading minds that are gathered together in *Beyond the Punitive Society*." —Clifton Fadiman

1973, 274 pages, cloth \$8.95, paper \$3.95

THE BELEAGUERED MINORITIES

Cultural Politics in America

S. J. MAKIELSKI, JR., Loyola University

While the old minorities and the political system have been able to accommodate one another during this century, discontent within the "beleaguered" groups of which the author speaks (blacks, Indians, Mexican-Americans, students, and women) is becoming increasingly obvious. This book is a lucid analysis of the dilemmas these minorities face in seeking political remedies. Important reading for any course in minority and urban studies and for introductory courses in American government and politics.

Publication date: Fall 1973 Paper and cloth.

PEACE AND WAR

Edited by CHARLES R. BEITZ and
THEODORE HERMAN

With a Foreword by Alan Geyer, Colgate University

This stimulating anthology of essays results from the Colgate University Peace Studies program. Many of the readings are by former prominent policy makers and leaders (including Henry A. Kissinger, Robert S. McNamara, Che Guevara, and John Kenneth Galbraith). The collection's special focus on war and its prevention makes it especially appealing to today's students, who are interested in moral issues as well as the analytical approach to the study of war and conflict.

1973, 435 pages, cloth \$11.95, paper \$4.95

REGIONAL POLITICS AND WORLD ORDER

Edited by RICHARD A. FALK, Princeton University,
and SAUL H. MENDLOVITZ, Rutgers University

This important collection of essays and original material by specialists on various aspects of international relations attempts to provide a basis for full-scale appraisal of the relevance of regional developments to the future of world order. Contributors include Roger Masters, Joseph S. Nye, Ernst B. Haas, and Bruce M. Russett.

New books on important subjects:

PARTY AND FACTION IN AMERICAN POLITICS: THE HOUSE OF REPRESENTATIVES, 1789-1801 *by Rudolph M. Bell.*

Vast new strata of information are uncovered; and unsuspected coalitions revealed. This quantitative analysis of actual voting records will revise simplistic views of our government's formative years. **\$13.95**

BEGINNINGS

AMERICA FOR AMERICANS: ECONOMIC NATIONALISM AND ANGLOPHOBIA IN THE LATE NINETEENTH CENTURY

by Edward P. Crapol. A strident economic nationalism called for commercial independence and for trade domination in this hemisphere. It intensified animosity for England throughout America. "An important contribution. . ."—*Library Journal* **\$12.50**

ANGLOPHOBIA

LIBRARIES IN THE POLITICAL SCENE: GEORG LEYH AND GERMAN LIBRARIANSHIP, 1933-1953 *by Marta L. Dosa.*

Political oppression, total war, and reconstruction brought crises to individuals and institutions. Original resources from Berlin's archives and Georg Leyh's family have provided insights new in English. **\$12.50**

INFORMATION

THE UNBOUNDED FRAME: FREEDOM AND COMMUNITY IN NINETEENTH CENTURY AMERICAN UTOPIANISM

by Michael Fellman. Intellectuals of many persuasions sought to invent perfect communities, then disagreed on basic concepts. Analyzes utopian thought from Brisbane through Howells. "An important contribution to American intellectual history."

—Merle Curti **\$10.00**

COMMUNES

ART AND POLITICS: CARTOONISTS OF THE MASSES AND LIBERATOR *by Richard Fitzgerald.* The period from 1911 to 1924 was an uneasy time. Radical publishing flourished in America. Fitzgerald examines five cartoonists and their work, for this study-in-depth: art in service of ideology. 60 illustrations. **\$14.50**

RADICALS

FROM CONTRABAND TO FREEDMAN: FEDERAL POLICY TOWARD SOUTHERN BLACKS, 1861-1865 *by Louis S. Gerteis.*

Slaves enveloped by Union lines served Federal purposes as a labor pool, regulated to forestall racial agitation. Expedient "emancipation" of blacks brought no real social reform. "A worthwhile addition. . ."—*Library Journal* **\$11.50**

EXPEDIENCE

AMERICAN GUNBOAT DIPLOMACY AND THE OLD NAVY, 1877-1889 *by Kenneth J. Hagan.* What were the purposes of

policing the world with old wooden warships: expansionism, ideology, commerce—or all of those? This well-rounded study is of value in comprehending the period. "The author has succeeded notably. . . Scholarly history at its best!"

—*Library Journal* **\$11.50**

DIPLOMACY

**HUMAN MEMORY AND KNOWLEDGE: A SYSTEMS
APPROACH** *by Glynn Harmon.* Man's structures for the

organization of knowledge follow a design constricted by his capacity for short-term memory. This analysis points toward means of predicting specific advances in knowledge. **\$9.50**

KNOWLEDGE

**SAMUEL GOMPERS AND THE ORIGINS OF THE AMERICAN
FEDERATION OF LABOR, 1848-1896** *by Stuart Bruce Kaufman.*

Analysis of writings by Gompers and those nearest him reveals Gompers' true intent was to modify Karl Marx's European design to suit the American circumstance. Will enliven a continuing debate. **\$11.50**

UNIONS

**THE IMAGE OF THE ARMY OFFICER IN AMERICA:
BACKGROUND FOR CURRENT VIEWS** *by C. Robert Kemble.*

This book surveys changes in America's attitudes toward its military careerists. Opinions from Washington's and Jefferson's to Mumford's and Mailer's are cited. "Unique and valuable contribution to the literature on the subject."

MILITARY

—*Library Journal* **\$10.75**

**TRAMPS AND REFORMERS, 1873-1916: THE DISCOVERY
OF UNEMPLOYMENT IN NEW YORK** *by Paul T. Ringenbach.*

Since Plymouth Rock, the vagrant had been thought to be a willful social threat. Not until the panics of 1893 and 1907 did reformers see correlation between the prevalence of tramps and the scarcity of jobs. **\$10.50**

UNEMPLOYMENT

ROOTS OF MARYLAND DEMOCRACY, 1753-1776 *by David
Curtis Skaggs.* A widespread poor tenantry, denied vote or office,

surged in democratic revolution against the gentry leadership. Skaggs' conclusion is clear: many Marylanders fought the War of the Revolution primarily to change prevailing structures within the colony. **\$12.00**

MARYLANDERS

**THE TARIFF, POLITICS, AND AMERICAN FOREIGN POLICY,
1874-1901** *by Tom E. Terrill.* With neither one dominant, both

major parties spotlighted tariff levels. Republicans aimed high, Democrats low. Then, boom and bust convinced both parties that prosperity hinged on foreign trade, and required an expansionist consensus. **\$12.00**

TARIFFS

**EBONY KINSHIP: AFRICA, AFRICANS, AND THE AFRO-
AMERICAN** *by Robert G. Weisbord.* Black nationalism in America

grows out of a 150-year search for black dignity, identity, prosperity. This book documents that search. Foreword by Floyd B. McKissick. "Worthwhile reading, especially since material on . . . the topic is so rare." —*Library Journal* **\$10.95**

**MODERN PUBLIC
ADMINISTRATION,
Third Edition**

FELIX A. NIGRO & LLOYD G. NIGRO

The Third Edition of this comprehensive introduction to public administration has been thoroughly updated to include recent developments in the field. All chapters have been significantly revised, and a new chapter on values and public administration has been added. Written in nontechnical language, the book covers both theory and practice and relates administration to the social and other environments of government and to politics and the policy-making process. 468 pp.; \$9.95. October, 1973.

**TRADITION AND IDENTITY
IN CHANGING AFRICA**

**MARK A. TESSLER, WILLIAM M.
O'BARR, & DAVID H. SPAIN**

This unique volume discusses the broad issues confronting three different African peoples experiencing rapid social change. The resulting identity crises are viewed from all levels of the social system through an integrated set of field studies. Each comparative account is presented in a common format and with a common theoretical focus. Empirical data which goes beyond the case study material introduce generalizations relevant to a broad range of issues. Tentative: 368 pp.; \$4.95: paper. October, 1973.

India's Revolution

Gandhi and the Quit India Movement

Francis G. Hutchins

Gandhi's Quit India movement of 1942 climaxed a nationalist revolutionary movement which sought independence on India's own terms. The author maintains that independence was attained through revolution, not through the benevolence of the British Imperial regime, and he uses the Indian case to develop a general theory of the revolutionary nature of colonial nationalism.

\$14.00

Politics in War

The Bases of Political Community in South Vietnam

Allan E. Goodman

Politics in War deals mainly with the years 1967–1970, but bears on the problems South Vietnam faces now that American forces are no longer active. Mr. Goodman has based his analysis of how the Vietnamese saw the period of deepest American involvement on firsthand research, including over three hundred interviews with Vietnamese political leaders and government officials.

\$12.50

Revolutionary Politics in the Long Parliament

John R. MacCormack

The author provides a fresh and coherent interpretation of the events chronicled in the first volume of S. R. Gardiner's monumental *History of the Great Civil War*. This is the first systematic study of the politics of five crucial years of the Puritan Revolution, the period between John Pym's death in December, 1643, and the execution of Charles I in January, 1649.

\$14.00

Minorities Under Communism

Nationalities as a Source of Tension Among Balkan Communist States

Robert R. King

The author explores the impact of major national minorities in southeastern Europe from 1945 to the present. Included are discussions of post-World War II conflicts over borders, methods employed to reduce the appearance of national minorities, and use of historical controversies to advance claims to adjacent territories and populations.

AMERICA'S ARMY IN CRISIS

A Study in
Civil-Military Relations

WILLIAM L. HAUSER

Lt. Colonel, U.S. Army

Faced with an unwon war, plagued by internal dissension, drug abuse, charges of racism, and recruitment problems — can America's Army survive? Will it adapt?

In this thoughtful and objective approach to the Army's problems, Lt. Colonel Hauser, a career Army officer, identifies the social forces with which the Army must come to terms if it is to survive as a vital organization in a democratic society. His controversial solution — two armies, one a specialized fighting force with spartan standards for barracks life, physical fitness, and military preparedness; the other a support army with many of the opportunities and incentives of a civilian organization.

"... a unique effort to comprehend and resolve the problems of an institution in transition."—**ROBERT E. OSGOOD**

"William Hauser has avoided the quagmire of polemics by keeping his study clearly focused on relevant policy. An important book on an important topic."—**CHARLES C. MOSKOS, JR., Northwestern University**

\$8.50

INTERNATIONAL PEACEKEEPING AT THE CROSSROADS

National Support—
Experience and Prospects
DAVID W. WAINHOUSE

With the assistance of
Frederick P. Bohannon, James E.
Knott, and Anne P. Simons

In this comprehensive examination of how nations have participated in peacekeeping operations over the past 25 years, the authors stress manpower, financial, and logistical support. They analyze the nature and scope of national support for several United Nations peacekeeping operations, and also assess the importance of regional organizations in peacekeeping. They conclude with a summary of costing problems, logistical management, and planning for peacekeeping.

The Johns Hopkins University Press, Baltimore, Maryland 21218

Law School of Harvard University

Cambridge, Mass. 02138

Liberal Arts Fellowships in Law

For the academic year 1974–1975 Harvard Law School offers four or five Liberal Arts Fellowships to college and university teachers in the arts and sciences for a year at the Law School. Holders of these Fellowships will have the title of Fellow in Law and . . . (History, Sociology, Political Science, Economics, Philosophy, etc., depending upon their particular discipline).

The purpose of the fellowships is to enable teachers in the social sciences or humanities to study fundamental techniques, concepts, and aims of law, so that, in their teaching and research, they will be better able to use legal materials and legal insights which are relevant to their own disciplines.

Fellowship holders will presumably take at least two first-year courses in law, in addition to more advanced courses, and will participate in a joint seminar. The year of study will not count toward a degree.

The fellowship grant is sufficient to cover tuition and fees. The Chairman of the Liberal Arts Fellowship Committee will be glad to write a letter to any funding agency to which the applicant has applied describing the Program and indicating the extent of the Committee's interest in inviting the applicant to be a Fellow.

Applications should include a biographical résumé (including academic record and list of publications), a statement explaining what the applicant hopes to achieve through his year of study, and two letters of recommendation.

Applications for 1974–1975 should be submitted before January 15, 1974, to the Chairman, Committee on Liberal Arts Fellowships, Harvard Law School, Cambridge, Massachusetts 02138.

Awards will be announced before February 15, 1974.

WORTH LOOKING INTO

POLITICS AND THE INTERNATIONAL SYSTEM

Second Edition

Edited by **Robert L. Pfaltzgraff, Jr.**, *Fletcher School of Law and Diplomacy, Tufts University*

Ten new selections reflecting the impact of current international tensions, recent technological progress and research are included in this revised edition. The selections—forty-two in all—include some of the most important writings on the nature and scope of international relations as a discipline, and on the study of international phenomena.

614 pages/1972/paperbound, \$6.50

CONTENDING THEORIES OF INTERNATIONAL RELATIONS

James E. Dougherty, *St. Joseph's College (Pa.)*, and
Robert L. Pfaltzgraff, Jr., *Fletcher School of Law and Diplomacy, Tufts University*

This highly useful book is both an overview and a synthesis of international relations theory. Theories of conflict, war and revolution are thoroughly discussed. Pacifism, imperialism, balance of power, realist theory, man-milieu relationships, international systems theory, theories of international integration, decision making, theories of conflict and deterrence, disarmament and arms control, are all presented in their historical context.

"... exhibits a remarkable scope and range. But most importantly, through it all the book remains provocative and readable." —*World Affairs*

"... provides a comprehensive and reliable guide to the study of international relations as a whole." —*International Affairs*

The 4-Dollar. 5-Minute. Whole-Earth. Political Scientist's Computerized Dream:

An Individually Tailored Research Source List.

Learning — awakening, epiphany, insight — is rewarding in itself as few other endeavors can be.

But the time-consuming task of finding out where to begin is only tedious: hours, even days, spent in the unenlightening company of 3x5 cards and journal indexes to sort out those few nuggets from the vast lodes of scholarship that will pan out to your benefit.

We've developed a way to speed up that first step so you can devote

your time to the heart of the matter—the reading, thinking and writing involved in preparing your thesis, dissertation, monograph or research paper. We've collected and put on computer the title and author of every article that's ever appeared in any of 183 political science journals published the world over, since the journals began — more than 115,000 articles covering theory, public administration, international relations and urban studies.

On demand, we'll search the file by computer for any topic or author you select, furnishing a bibliography individually tailored to your needs — up to 25 citations for only \$4, or 50 for \$5, and more at the same rate until the sources are exhausted. The computer searches with enlightening speed; by far the largest portion of your time can then be spent in productive research. Your time becomes truly yours.

The rest, of course, is up to you. We can't tell you what conclusions to draw. We can't tell you how to write your paper, or live your life (though we can help you find time to do those things yourself). We can tell you where the information you want is. Now. When you need it. Send for free details, or call us with your order.

(By phone, \$6 for 25 citations, \$7 for 50, plus C.O.D. postage.) Call toll free to place an order:

800-854-3379

QUASI-EXPERIMENTAL APPROACHES

Testing Theory and Evaluating Policy

edited by James A. Caporaso and Leslie L. Roos, Jr.

These nine interrelated essays explore the use of quasi-experiments with short- and long-time-series data. General essays and specific case studies compare quasi-experimental and more traditional approaches. The examples are drawn from a number of fields, including comparative politics, international relations, organizational behavior, and environmental studies.

THE POLITICAL INTEGRATION OF URBAN SQUATTERS

by Marc Howard Ross

The booming urban centers in the developing areas of Africa, Asia, and Latin America represent both the promise and the frustration of rapid social change. Drawing on national and international theories of political integration, Professor Ross outlines the process by which a squatter settlement in Nairobi, Kenya, led by former Mau Mau freedom fighters, developed into a politically integrated community where most observers would expect to find disorganization.

SURVEY RESEARCH IN AFRICA

Its Applications and Limits

edited by William M. O'Barr, David H. Spain, and Mark A. Tessler

At a time when Western researchers working in Africa have been charged with insensitivity to African problems and with distorted and ethnocentric research priorities, the problems involved in crossing cultural lines to conduct social research are many and varied. After an introductory essay discussing the history of survey research and the recent turmoil surrounding it in Africa, the papers explore the ethical, epistemological, and methodological implications of applying Western techniques to African research problems.
336 pages cloth: \$15.00 paper: \$4.95

ELITE AND SPECIALIZED INTERVIEWING

by Lewis Anthony Dexter

From his virtually unique experience in the field of elite interviewing, the author has distilled a number of recommendations about the mechanics of the interview process: how to approach a prospective subject, how to conduct the interview, and how to record it. Working toward a "transactional" theory of interviewing, Dexter investigates the effects that the interviewer himself has on the person being interviewed and on his responses.

New Paperbacks from Praeger

URBAN POLITICS AND PUBLIC POLICY

The City in Crisis

Edited by **Stephen M. David**, Fordham University, and **Paul E. Peterson**, University of Chicago

This imaginative new reader illustrates how deficiencies common to most urban political systems affect the formulation of public policy in our cities. The book is divided into three sections. The first defines and analyzes three of the most glaring of these inadequacies—the autonomy of urban bureaucracies, the existence of multiple governments, and limited access to political processes given groups with little power. The second section examines the effects of these deficiencies on four key policy areas—land use, law enforcement, education, and transportation. Section three presents a series of proposals for solving the problems defined and illustrated in the first two sections of this collection.

THE POLITICS OF ENVIRONMENTAL CONCERN

Walter A. Rosenbaum, University of Florida

This book draws together the basic elements of environmental politics: the nature and gravity of the ecological threat; the roles played in pollution politics by politicians, government agencies, businessmen, and public interest groups; conflicting ideologies and resulting concerns; and current administrative practices and legislative developments at the federal, state, and local levels. The contributions and boon-doggling of HEW, Interior, and Agriculture departments, and the Council on Environment Quality; the tenuous position of the Environmental Protection Agency; and the conflicts among ecologists and the public are weighed throughout. The book concludes with an assessment of what needs to be done—and what action may be possible.

BOTH YOUR HOUSES

The Truth About Congress

Warren Weaver, Jr.

"The Capitol is a hall of illusions, peopled by the myths that the legislative branch remains proudly coequal, that Congress continues to serve the nation well, that the old ways are sufficient to the tasks of the new day. None of this is true," writes

Warren Weaver, Jr. This book tells the story of the deterioration of Congress. The author uncovers the weaknesses that have brought both houses to their current parlous condition, and he proposes some practical remedies. He discusses such topics as the shortcomings of the committee system, the importance of rules and customs in both houses, the role of the conference committee, congressional ethics, and how Congress handles its financial and foreign policy responsibilities. Warren Weaver, Jr., is a congressional and national correspondent of *The New York Times*.

September, 1973 318 pp. \$2.95 paper

GOVERNMENT AND POLITICS IN AFRICA

Leslie Rubin, and **Brian Weinstein**, Howard University

This work adopts a unified approach to the complexities of the contemporary African political scene. The authors first examine pre-colonial and colonial social and political institutions. They look at colonialism's effects on traditional systems, the different forms of opposition that emerged, and the relatively swift and peaceful return to autonomy. After discussing the areas still under European control, the authors turn to the major tasks confronting independent Africa in an analysis of problems of economic development and political growth. Finally, there is discussion of the independent states' efforts to achieve African unity and the continent's role in world affairs.

THE MIDDLE EAST

Nations, Super-powers and Wars

Yair Evron

This realistic analysis of the Arab-Israeli conflict provides a reasoned discussion of the deeper courses of the confrontation, its mechanisms and motivations, and the policies and strategies of the two sides. The Author concentrates on the actions and tangible interests of the adversaries rather than on their ideologies or moral claims. Part I gives a brief historical view of the conflict from 1948 to 1971. Part II describes the role of the super-powers and the structure of the relations between the nations of the Middle East. The Author is attached to the Van Leer Institute of Jerusalem, where he is director of its project examining the future of the Arab-Israeli relations.

THE DIMENSIONS OF QUANTITATIVE RESEARCH IN HISTORY

*Edited by William O. Aydelotte,
Allan G. Bogue,
Robert William Fogel*

14 authorities discuss the uses of mathematical methods in historical research. Ranging through social, economic and political history in England, France and the United States, their essays present the freshest and technically most promising work now being done. Each offers a concrete demonstration of the advantages and limitations of this new approach.

Around the world

The United Nations and the Superpowers U.S.-SOVIET INTERACTION AT THE U.N. THIRD EDITION

John Stoessinger
City University of New York

**A NEW EDITION
JUST PUBLISHED!**

Concluding that no single nation or group of nations controls the U.N., but that all use it to pursue their own national interests, Professor Stoessinger maintains:

"The key to a rejuvenation of the U.N. . . . must be sought at the political level in a commitment by the member states, especially the two superpowers and China, to use the U.N. rather than to by-pass it and let it atrophy."

The text focuses on how China's entrance into the U.N., the controversies between have and have-not states, and the emergence of new nations have affected the position and usefulness of the U.N.

Politics Among Nations THE STRUGGLE FOR POWER AND PEACE FIFTH EDITION

Hans J. Morgenthau

**HONORED AUTHOR.
DISTINGUISHED CLASSIC.**

Professor Morgenthau has updated this work with an eye to the changes in the balance of power and influence. The theoretical section has been enlarged to differentiate between usable and unusable power and between power and influence. The growing world concern over nuclear power and environmental problems is also examined.

Knopf, 1972 615 pages \$9.95

The Might of Nations WORLD POLITICS IN OUR TIME FOURTH EDITION

John Stoessinger
City University of New York

The winner of the 1963 Bancroft Prize in International Relations on first publication, **The Might of Nations** continues to be an objective authority on world politics. The case studies covering Bangladesh, the Mid-East, and Indo-China, and the discussion of such issues as the world ecological crisis update the text. This edition maintains that as China emerges, the post-war era of bi-lateral confrontation is being replaced by one of tri-angular oppositions.

There are chapter bibliographies.

Macropolitics in a Global Society

Richard W. Sterling
Dartmouth University

COMING THIS WINTER!

Aimed at the first course in international relations, this new text studies the international system from a global point of view.

Maintains that:

... although national and regional interests are legitimate they must be measured in terms of how well they meet the growing needs of the world as a whole.

... there must be a redistribution of power, wealth, status and education if a reasonably peaceful world society is to be maintained.

Includes:

... an entire chapter on global ecology
... data and analysis relevant to 1970-2000 (utilizing data and research from 1965-1973)

... comprehensive treatment of such phenomena as multinational corporations, contemporary international monetary problems, and the current status of armament and arms control

... analysis of both sociological and ideological developments (e.g., population pressures are studied as carefully as major power rivalries)

... detailed appendices

COMING THIS SPRING!

The second edition of a pioneering volume in the field of American judicial politics. Combining analytic essays by the editors with readings drawn from sources such as Supreme Court cases, historical documents, and personal letters of statesmen, this text explores the political significance of the judiciary's activities. There is also an entire section on judicial ethics.

Each chapter includes an introduction summarizing the important principles and issues around which the following readings are grouped, and headnotes precede each selection.

DECENTRALIZATION
AND SCHOOL EFFECTIVENESS
A Case Study of the 1969
Decentralization Law in New York City

MELVIN ZIMET

Foreword by David Rogers

Through a study of the decentralization process in one community school district in the South Bronx, the author views the effects it has had in terms on restructured authority and power relationships and of educational output. He explains how the failure of the Decentralization Law to reconcile the great differences between decentralization and community control planted the seeds of future conflict between the Community Board and the Central Board.

POLITICAL SCIENCE

Announcing:

AN INTRODUCTION TO AMERICAN GOVERNMENT

**Kenneth Prewitt and
Sidney Verba**

Written for the beginning student in American government, this text opens with an innovative discussion on the U.S. economic system and how it has shaped the kind of democracy we have. After detailing the origins and development of American "political capitalism," the authors consider its implications on the class structure of America. Other unique questions are considered: The degree to which the principle of democracy in fact has its roots in the hearts and minds of the American people and how the American citizen participates in political life. The authors also discuss how policy is made and who makes it. This discussion is applied to four policy issues: tax policy, medical care, the desegregation of public schools, and Vietnam.

Each chapter concludes with a "controversial question" designed to help the student understand the underlying issues and to see how political differences derive from disputes over the evidence and from differences of political values. The book presents several short sections describing how political scientists study politics, including a section on sample surveys and how they are conducted and a section showing how the student can investigate public policy and study government institutions.

grating the various groups of society, or mediating among them); or (4) the supposedly unique instrumentality it uses to perform its tasks (legitimate coercion). A certain view of history, or perhaps cultural arrogance, also lay behind the emphasis on the formal organizations of sovereign states. This was the view that sovereign state-organization, as developed in the modern West, was the natural destiny of all societies, and not a remote end but one achieved as soon as a modicum of "civilization" was attained—so that the kinds of politics described by early anthropologists like Maine and Fraser could be dismissed as simply "prepolitical."³

It is true that political scientists have long been concerned with all sorts of organizations and activities that impinge upon states but are not, formally, parts of them. However, their concerns with such phenomena initially derived from and were circumscribed by their very identification of politics with state-organizations. Attacks on that identification can be traced back only to about 1930 and became common only in the 'fifties.⁴ The chief factor that made the objections common then, and now, involves the broadening geographic interests of political scientists: their new and growing interest in the politics of "developing" societies. In such societies, a search for specialized formal organizations exercising the attributes of sovereignty, and displaying the supposedly unique characteristics of states, sometimes reveals nothing at all or, more commonly, a facade behind which political realities lie rather ineffectively hidden. This is most obvious, of course, in still largely tribal societies, where functionally diffuse structures based on primordial identifications remain the focus of social regulation, whether or not imitation-states (or rather capitals) have been superimposed on them; and between these and modern Western state-organizations runs an extensive continuum on which different approximations to what we know as statehood can be discerned. The narrow traditional notion of political phenomena did not serve subjective interests in such societies, nor prevent the feeling that they had, in some sense, a "political" life like other polities, even at the most primitive levels of social organization.⁵

³For a choice example of this view, see William Archibald Dunning, *A History of Political Theories* (New York: Macmillan, 1902).

⁴I am ignoring here certain much earlier normative political philosophers who are discussed below. The reason for ignoring them at this point is stated in the later passages.

⁵See the very large literature on "primitive" political systems: e.g., M. Fortes and E. E. Evans-Pritchard,

Doubts about the narrow conventional conception of politics having thus been engendered, it became manifest that the conception was unserviceable even for an extensive interest in the politics of Western societies. The focus on state-organization restricts study to Western societies roughly after the Peace of Westphalia (no exact date can be given, of course). If we go back much farther we find the work of sovereign state-organizations performed by a hodgepodge of diffuse, imperfectly differentiated, more or less autonomous institutions: royal dynasties, ecclesiastical structures, municipal councils, guilds, merchant companies, land-owning nobles, and universities. We find no "constitutions" as formal organizational blueprints, only charters, compacts, bills (and sometimes so-called Constitutions, like those of Clarendon) as contractual agreements or explicit statements of usage among competitive and overlapping *potentias*. We find no monopolies, actual or pretended, of legitimate coercion. We find, instead, a long and slow fashioning of sovereignty and its instruments as a gradual process of "political expropriation"⁶ that seems more tied to special historical circumstances than to the universal attributes of civilized life. Yet one has the sense that "politics" antedates that process and went on throughout its unfolding; and political scientists anxious for light on political development in non-Western societies turn, not unnaturally, to the earlier histories of Western polities themselves.

As the boundaries between state-organizations and other structures for carrying on government and politics weakened, another objection against the focus on state-organizations also emerged. This criticism involved a view occasionally advanced earlier (e.g., by Merriam);⁷ that, apart from possibly unimportant variables like size, there is not all that much difference between "public" governments and "private" ones—not enough, at any rate, to warrant a generic distinction on which to rest disciplinary divisions and all they entail.⁸ This view is quite different from one admitting the study of "private" groups into the field as influ-

African Political Systems (London: Oxford University Press, 1940); I. Schapera, *Government and Politics in Tribal Societies* (London: Watts, 1956); A. I. Richards, editor, *East African Chiefs* (London: Faber, 1960); and Lucy Mair, *Primitive Government* (Harmondsworth: Penguin Books, 1962).

⁶Max Weber, *From Max Weber: Essays in Sociology* (New York: Oxford, 1946), p. 83.

⁷Charles Merriam, *Public and Private Governments* (New Haven: Yale, 1944).

⁸See especially Robert A. Dahl, "Business and Politics: An Appraisal of Political Science," *American Political Science Review*, 53 (March 1959), 1-35.

ences on public power and policy. The latter view treats the groups as related to political systems through boundary-exchange; the former admits them as political systems in their own right. It thus implies that, in excluding private governments, political science deprives itself of much material useful for building empirical theories while, at the same time, failing to make an optimum contribution to the general understanding of social life.⁹

The Functional Conception of Politics

The principal response to the difficulties raised by the notion of politics as centered on state-organizations has been a tendency to define politics in terms of certain social functions rather than social structures.¹⁰ The essential purpose of the functional conceptions has been to raise the traditional focus of political study to a somewhat more general level, at which equivalence between sovereign state organizations and other structural modes of carrying on what is sensed to be political activity becomes apparent.

The logic behind the functional conceptions seems impeccable. Political structures differ widely in space and time, so that the identification of politics with any special structural arrangement unduly restricts and handicaps the field. But different structures can perform the same functions (i.e., can be functional "equivalents"). Hence, the field's scope can be broadened and yet remain clearly defined in relation to nonpolitical phenomena if one identifies the functions of state-organizations and then studies whatever performs those functions where such organizations do not exist or are ill-developed.

Neat as this may seem, the functional revision creates large difficulties of its own. The foremost is that the functions of political structures seem hard to identify, as shown by the fact that practically no functional conception of what is "political" coincides exactly with any other. To be sure, we can discern a sort of latent consensus among the conceptions, but it is on a notion of the "political" function that seems, in the final analysis, to identify nothing in particular at all—to make politics into the

study of "the whole of social life in all its facets," as Bentley put it. Some people may not object to this. But it is hardly what the functionalists intend; it may impose intolerable burdens in political research; it probably leads to theories so general (because concerned with such a diversity of phenomena) as to be trivial and uninformative; and if politics becomes equated with social life we will no doubt want to carve it into separate fields, as we now carve up social studies, thus returning to where we started.

The function on which the various functional conceptions converge is that of "maintaining social order"—not in the narrow sense of "law and order" but in the very broad sense of assuring the continuity (viability) of society through its harmonious and efficient operation. That function, as functional sociologists like Parsons make clear, is really a large and diverse (indeed all-encompassing) complex of functions. Parsons lists them under four categories, which will do about as well as any: (a) pattern-maintenance (roughly, imparting to members the society's general norms of behavior and special norms pertaining to its special roles, and getting commitment to them); (b) integration (coordinating the elements of social life to make them mutually supportive, or at least not mutually destructive); (c) goal-attainment (defining and achieving social ends and purposes); and (d) adaptation (generating an appropriate level of social resources, distributing them in ways perceived as just, and mobilizing them to the attainment of social goals). It should be apparent that all institutions of society, in one way or another, to one degree or another, are involved in the performance of these functions. It is also evident that all the functions must be performed in all social institutions if these are to be "viable"—a point that functionalists gleefully emphasize rather than conceal.

Functional definitions of politics thus converge on a view that broadens the scope of the field at the cost of virtually eliminating its boundaries altogether. For this reason, they hardly define the political scientist's subjective interests, however much broader now than formerly; and while all social phenomena might be usefully analyzed in terms of the order-maintaining function at a high level of generality, it hardly follows that disciplinary distinctions beneath that level are unimportant. One might note, in this connection, that functional ap-

⁹ For a more extensive critique of the traditional conception of politics, see David Easton, *The Political System* (New York: Knopf, 1953).

¹⁰ Examples are Gabriel A. Almond, "Comparative Political Systems," *Journal of Politics*, 18 (August 1956), 391-409; Almond and James S. Coleman, editors, *The Politics of the Developing Areas* (Princeton: Princeton University Press, 1960); Talcott Parsons, "Voting and the Equilibrium of the American Political System," in *American Voting Behavior*, ed. Eugene Burdick and Arthur J. Brodbeck (Glencoe: Free Press,

1960); and David E. Apter, "A Comparative Method for the Study of Politics," *American Journal of Sociology*, 64 (1958), 221-237.

proaches to special subjects, like politics and economics, have been mainly advanced by sociologists in quest of overarching theories,¹¹ and that such approaches in politics have, over a span of about a decade and a half, hardly gone beyond the initial definitional level of conceptualization.¹²

The obvious way to save the functional alternative from this difficulty is to identify politics with a single "political" function in performing which modern state-organizations specialize. But this also raises large problems. One, as stated, is to identify the function. Two views on this are common (and others are possible or occasionally advanced): Politics is concerned with "goal-attainment" (Parsons), or politics is concerned with "integration" (Almond). That difficulty might be resolved, in the manner of Bourricaud and Spiro, by a synthesis: Politics is concerned with "integrating conflicting views about social goals."¹³ However, that would still leave a major research difficulty. Functions are abstractions, not concrete entities. The first task of any political analysis would therefore be to identify the structures—or, worse, aspects of structures—that have something to do with the performance of the functions, which might be all or any in a society. Parsons puts his finger on the intricacy of that task in a rather offhand footnote: "The polity in (my) sense is *not* identical with government, which we interpret to be a complex of *organizations*. Government has other than political functions, and other organizations participate in the polity."¹⁴ No sweat for people like Parsons, who steer clear of empirical work on concrete phenomena. But what does one do when descending from the

rarefied air of conceptualization? What aspects of American government, for instance, are, or are not, political? What aspects of American business, trade unions, schools, professions? The critical point is that, on such a basis, we still wind up studying "the whole of social life in all its facets," quite as much as with the broader functional alternative. In one case, we do so because everything is political, in the other because everything has, or might have, political aspects. And the burden this entails is magnified by having to identify the political aspects without structural guidelines to the task—no guidelines other than that they must have something to do with goal-attainment or integration. No one has ever done this or anything like it; and no wonder.

The moral is that functional conceptions of a subject matter are, in their very nature, to be avoided if satisfactory structural ones, directing attention immediately to concrete phenomena, are available. But can one really devise a structural conception of politics that avoids the main shortcomings of the traditional conception of the field—a conception that does not define the subject in narrowly culture-bound terms, nor make too sharp and rigid the distinction between public governments and private ones?

Politics as Asymmetric Relationships

Attempts to redefine the subject matter of politics antedate recent interests in underdeveloped, developing, and historic polities by quite a bit. The earlier attempts (mainly of the 'thirties) were in fact structural, not in the least culture-bound, and virtually oblivious to distinctions between public and private governments. If nothing else, they demonstrate that the functionalist's way of delimiting the field is not the only alternative to the conventional structural conception.

The object of the earlier redefinitions was to make politics a "discipline" rather than to accommodate expanding subjective interests—save perhaps for a still embryonic interest in private groups as political orders in themselves (rather than because of their boundary-exchanges with "polities"). In gist, their object was to make it possible for political science to be scientific in some serious sense of the term, and those who advanced the redefinitions were, in that respect among others, precursors of contemporary "behavioralism" in the field. The prevalent conception of the scope of politics seemed to them the first and foremost impediment to the achievement of a "science" of politics, in part because of its very narrowness, in part because the phenomena considered political seemed too

¹¹ E.g., Talcott Parsons and Neil J. Smelser, *Economy and Society* (Glencoe: Free Press, 1956).

¹² This criticism does not apply to works that do not define politics functionally but urge a functional approach to the subject otherwise defined. For example, Almond's widely influential functional approach to the study of political systems is mainly tied to a conception of politics that stresses, à la Weber, an instrument of action rather than a social function: legitimate coercion. In his definition of 1966, legitimate coercion (plus territorial jurisdiction) is all that is advanced; in the definition of 1960, functional language is merely added to the original notion—probably to make the definition of the subject look as functional as the approach to its study. (See note 10, above, for references.)

¹³ Bourricaud: Political structures have the task of forging a common will out of conflicting wills in a society. Spiro: Political structures are those institutions of a society that "process" their "issues." See François Bourricaud, "Science politique et sociologie," *Revue française de science politique*, 8 (June 1958), and Herbert J. Spiro, "Comparative Politics: A Comprehensive Approach," *American Political Science Review*, 25 (September 1962), 577–596.

¹⁴ Parsons, *Structure and Process in Modern Societies* (Glencoe: Free Press, 1960), p. 42.

complex and various to serve as the subject matter of a science. In a sense, the very "uniqueness" used to justify the autonomous study of state-organizations furnished the main ground for their attacks on the conventional delimitation of politics as a discipline.

A typical argument to this effect is Catlin's.¹⁵ Science, Catlin argues, induces generalizations from "simple" phenomena that are "commonplace and frequent of occurrence"; states have been and are few in number, and are also quite "uniquely" constituted (i.e., complex and variable on many dimensions); hence nothing can safely be induced from their study. The problem is readily translatable into statistical language: it is difficult or impossible to generalize if one has a small n and a large variance. The solution must be to find a far simpler subject matter embodying many more instances. That subject matter must certainly be of the essence in state-organizations, but, just as certainly, it must also be found in many other contexts.

Note that the problem discerned was not that of finding "equivalents" of state-organizations in premodern cultures. The problem was to find something to replace the focus on the state in all cultures.¹⁶

Despite differences in language, the solutions proposed, like those of the functionalists, converged on a common point. In essence, it was proposed that politics be equated with what might be called "asymmetric" human relationships. All the early revisionists started with the same question: what are (in Catlin's chemical metaphor) the "elements" from which all political complexes, as thought of conventionally, are compounded—or, in different metaphors, the particles or cells of "bodies" politic? The answer was derived from what seemed (and no doubt is) an obvious truth: governments are *complexes* of rule and hierarchy (of *κράτος* and *-αρχος*). Hence the elementary relations constituting them must be *items* of power, or control, by some men over others. In essence, these items consist of interactions in which abilities to produce intended effects and derive benefits are unequally distributed. This is precisely what is meant by "asymmetric" relations; as Lasswell might put it in his pungent way, they are relations in which someone affects more than he is affected, controls more than he is controlled, and/or gets more of what is allocated. Such asymmetries manifestly occur in

virtually all human relationships, everywhere and on all social levels. They certainly are intrinsic to state-organizations, but states are just particularly large, complex, well-patterned, persistent, and (more questionably) "pure"¹⁷ complexes of them. Asymmetric relations thus provide just the sort of simple, frequent, and commonplace units of analysis that inductive science seems to presuppose.

Anyway, so the argument went—and it surely is not, *prima facie*, unpersuasive. It would be hard to argue that asymmetry is not inherent in governments of all types, at all social levels, or that anything of great consequence about the governments of states would be missed by considering them large and complex networks of power and control relations. Easton does point out that "goals"—the purposes to which power and control are put—also matter.¹⁸ He is right; but nothing precludes analysis of the substance as well as process of politics, no matter how politics is conceived. After all, nothing prevented those concerned with state-organization from analyzing their policies. Nor does the conception of politics as asymmetric relations (*pace* moral critics like Franz Neumann) necessarily have misanthropic implications. It does not imply, as Neumann argued it did, that all human collectivities are ultimately controlled by brute coercion, or that there are no absolute moral laws, or that democracy and constitutional government are impossible, or that no important qualitative differences of any consequence exist among polities, or even that asymmetry is always strongly weighted in favor of nominal rulers.

One is tempted to conclude, therefore, that when political scientists embarked on the search for a less restrictive conception of politics in the 'fifties, they leaped into functional definitions through insufficient consideration of available alternatives or because of moral biases without foundation. Nevertheless, one may have important reservations about the early structural redefinition. It seems better regarded as a large first step toward a serviceable conception of the field's subject than as a definitive delimitation of its scope.

Most important, the equation of politics with asymmetric relations delimits very little. Like the functional conception of politics as the order-maintaining aspects of society, it broadens the field by virtually eliminating its boundaries altogether. To be sure, there are social relationships that are symmetric, or as nearly so as

¹⁵ George E. G. Catlin, *A Study of the Principles of Politics* (London: Allen and Unwin, 1930).

¹⁶ Catlin was by no means the only man to perceive the problem, or to try to solve it. His contributions were in fact overshadowed by those along similar lines of Harold Lasswell.

¹⁷ "Pure" means "unmixed with symmetric interactions" here. For the reasons that this is questionable, see below.

¹⁸ Easton, *The Political System*, p. 117.

makes no difference. One thinks of buyer-seller exchange relations (under free-market conditions), affective relations among friends or spouses, or interactions on collegial decision-making bodies that are not just nominally collegial. But while such relations frequently occur, they "characterize" few social units; they do so less and less as the notion of symmetry is more strictly defined; they are virtually nonexistent in many societies and subsidiary units; and they are more likely to occur in ephemeral interactions than in organized or institutional collectivities. Certainly, it would be difficult to say that any concrete institution or relationship in any society is automatically excluded from the scope of politics defined as the universe of asymmetric relations.¹⁹

From this difficulty others follow. One involves our subjective interests. Easton (see Appendix) rejects the equation of politics with asymmetric relations mainly because of this consideration: political scientists are simply interested in "political" asymmetries, not all social asymmetries. A general theory of power, he argues, would help them, but would still have to be shaped to the special phenomena of political power, conceived in some narrower sense.²⁰ More important is the question whether conceiving politics more narrowly (but not in the very narrow sense of state-organization) is advisable also on "disciplinary" grounds—that is to say, whether a general theory of asymmetric relations, even if helpful, would help much. A strong argument to the effect that it would not can certainly be made.

The crux of this argument is that the world of asymmetric relations varies extremely on many dimensions, so that the classification of human relations into symmetric and asymmetric ones would not be very informative descriptively, hence also not in regard to theory. Asymmetric relations vary, for example, on the basis of numbers of people involved in them (from two to just about all human beings). They vary in regard to continuity and regularity of interaction—asymmetries exist in continuous and regular interactions in a persistent so-

cial collectivity (teacher and pupil, in school), or in regular but hardly continuous interaction (doctor and patient), or in ephemeral interaction (criminal and victim, or the slow driver and the drivers he slows down). They vary in regard to the nature of the "actors" involved in asymmetric interactions, who may be single individuals or more or less complex collective individuals. They vary in regard to degree and direction of asymmetries—i.e., they may, in varying degrees, involve unidirectional or multidirectional flows of power and control (in certain, probably most, respects, bosses control their secretaries; in others, secretaries run their bosses). And so on, along many more criteria of discrimination, any of which might be consequential for one theoretical purpose or another.

It is possible to cover all this diversity, and more, with generalizations of some sort, and no doubt some people's interests will run to such an extreme level of generality, or beyond. But the distinction between symmetric and asymmetric relations surely discriminates no more than the first and simplest distinction biologists make among members of that extremely heterogeneous class, the animal "kingdom": protozoa (one-celled animals) and metazoa (many-celled animals). For most purposes, a field so broadly delimited would have to be subdivided into many virtually autonomous subdisciplines, so that, as with the functional alternative, we come back again to our starting-point: trying to find some delimitation of "political" asymmetries that seems defensible on disciplinary grounds and at least approximates special subjective interests.

Delimiting the Scope of "Politics" as a Problem in Classification

Working out a reasonable delimitation of the scope of political phenomena is, of course, a matter of classification: arriving at the defining traits of a special class of cases to which the label "political" is sensibly applied. What we have uncovered to this point is a rather familiar problem in the construction of taxonomies (familiar, at any rate, in fields that take classifications more seriously, and construct them less arbitrarily, than political scientists do). To clarify that problem and point the way to a reasoned solution of it, we now go off on a brief tangent on the subject of constructing classificatory categories.

Taxonomies that do not just amount to arbitrary labeling can be constructed by numerous methods, which could only be treated fully in a separate paper. However, much the best of these methods for most purposes, as well as the most widely used where classification is re-

¹⁹ Catlin was quite aware of this problem. (See *A Study of the Principles of Politics*, p. 66.) He specifically counsels that politics, as a discipline, must not concern itself with "all the life of the community," only with those activities in it that are, somehow, political. On the other hand, recognizing that not much is left clearly nonpolitical by his definition, he also counsels Aristotelian wholism in holding that politics is present in all social relationships. Easton rightly extends this view to Lasswell's conception of politics, although not to his substantive work. (See *The Political System*, pp. 119-124.)

²⁰ Easton, p. 123.

garded as an important intellectual enterprise (e.g., in biology), is a procedure that might be labeled "progressive differentiation" (my term). That method happens to be especially useful if one is caught in the dilemma of being either excessively restrictive or excessively extensive in one's conception of a class of cases—precisely the difficulty uncovered here.

"Progressive differentiation" proceeds, in gist, as follows: (a) One begins with a very broad and heterogeneous subject matter, perhaps having nothing but one attribute in common, such as "organisms": material entities capable of reproducing themselves. (b) One then asks on what basis that subject matter can be subdivided into two (or at any rate a very small number of) very populous subsets, so that (1) all instances of the subject matter fall into one subset or the other, and so that (2) all cases in a subset share one characteristic additional to that of the whole subject matter, which (3) is not found in any case in the other subset(s). (That initial cut, in biology, is made between plants and animals, on the basis of ability to

produce "food" by processing inorganic matter.) (c) One then asks the same question of the subsets (e.g., animals, as stated, are divided into protozoa and metazoa) and continues thus to differentiate until one arrives at a compelling stopping point—the most compelling being the point where differentiations can only be made sensibly by singling out particular individuals, not sets of them.

The process involves the systematic use of "branching." Each offshoot, at every level, is a member of a more inclusive branch, but has at least one characteristic different from all other offshoots from the same branch. Figure 1 portrays the process graphically (using biological categories—somewhat simplified—to identify levels of differentiation).

Classificatory schemes constructed by progressive differentiation have several characteristics that such schemes ought to have if used as bases of general propositions. They leave nothing "residual" (unclassifiable), preclude ambivalence (i.e., having equally good reasons for classifying a case under two or more sets),

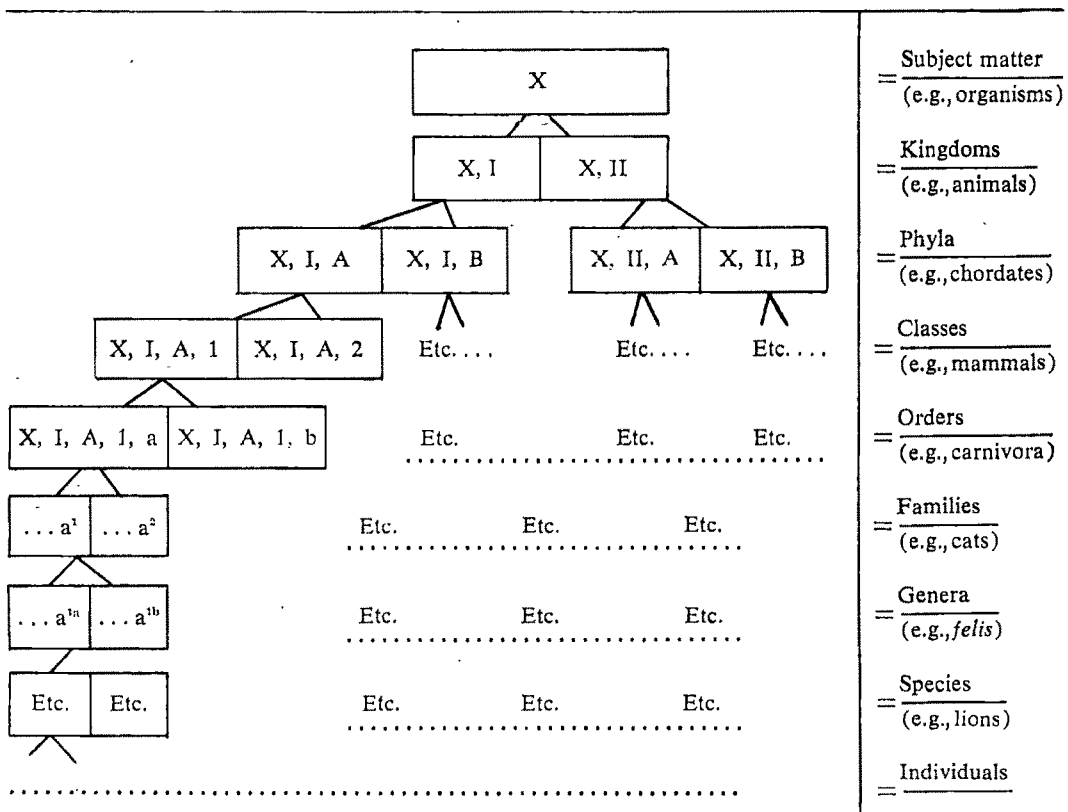

Figure 1. The method of progressive differentiation.

and also preclude ambiguity (difficulty in deciding to what set a case belongs). Even more important here, it should be evident that at the upper levels of a classificatory ladder thus constructed, cases will be very numerous and very heterogeneous, while at the lower levels they will become progressively more homogeneous—similar or identical on many dimensions—and more limited in number. Consequently, while generalizations are possible at any level, those that cover the more inclusive (less differentiated) categories will, of necessity, provide only limited information about the less inclusive classes, and sometimes hardly any of the information one subjectively wants about them. In that sense, they will be “vacuous.” On the other hand, a class may be so narrowly defined that subjectively sought information becomes available only at a disproportionate price in regard to the possibilities of induction, or validation of theories arrived at by any means whatever. In such a case, one is compelled to seek a trade-off between the extensiveness and homogeneity of the classes. Even if that compulsion is not absolute, any large gain in extensiveness is to be preferred if the cost in loss of homogeneity is small—not just because of the requisites of inductive methods but because of the parsimony of theories about a subject, in the sense of ratio between cases covered and information provided.

My criticism of others' ways of delimiting the scope of political study can now be restated in a more compact manner. In addition, the tack to take in order to solve the problem we have uncovered seems clearly to emerge from this note on methodical taxonomy.

(a) *The conventional delimitation of the scope of the field sacrifices too much extensiveness for the sake of homogeneity.* It does so not just because state-organizations are rather few in number, but also because they are not so different from other structures as to make the gain in homogeneity large. This is not to mention the nonmethodological fact, certainly admissible as a supplementary argument, that our subjective interests no longer are confined to so exclusive a subject matter, although they certainly continue to include it.

(b) *The early revisionist conception of politics as the study of asymmetric relations sacrifices too much homogeneity for the sake of extensiveness.* It does so chiefly because Catlin and his ilk seem to assume that typological categories should have only a single defining characteristic, “commonplace and frequent of occurrence.” Obviously they may have any number of them, so long as the mix between subjective interests and disciplinary imperatives re-

mains reasonable. (In fact, the broad structural conception of politics itself has at least three: (1) homo sapiens, (2) in relationships, that (3) are asymmetric.)

(c) *The later “functional” revision has the same result, compounded by difficulties that always arise when one emphasizes functions rather than structures.* It proceeds, implicitly, from the right question: to what more numerous, if less heterogeneous, class can “states” be considered to belong? But the answers provided lead to the same overextensiveness and excessive heterogeneity as do the earlier revisions and, still worse, direct attention to elusive abstractions from concrete observables.

(d) *Our problem then is to find a reasonable trade-off between the homogeneity of the conventional conception of the scope of the field and the inclusiveness of proposed revisions, without incurring avoidable costs in ability to identify pertinent phenomena.* To avoid vagueness, we want a “structural” conception of political phenomena. For the sake of homogeneity, we do not want to include all asymmetric relations, although we do want political phenomena to be a distinct subset of such relations. For inclusiveness, we do not want the conception to be limited to state-organizations, although we do want such organizations to be a distinct subset of the class.

This clearly calls for adding structural criteria of discrimination to that of “asymmetry.” The full set of traits must be characteristic of state-organizations and also of much else, and yet still delimit a rather homogeneous and precisely identifiable set of cases.

Here we can leave criticism, and turn to the constructive part of the argument.

Political Relations as a Subset of Asymmetric Relations

My position is that three criteria additional to asymmetry can be used to define the nature of political phenomena in a manner that reconciles our subjective interests with disciplinary requirements. Stepwise, they delimit successively narrower “populations” suitable to increasingly informative empirical theory—populations that increasingly resemble the phenomena central to the traditional subjective interests of political scientists, but that are not in the least culture-bound, nor so intrinsically limited in number or widely various as to rule out rigorous inductive procedures.²¹

²¹ It is probable that the criteria will seem “obvious” when stated. If so, all the better—and all the more reason for making them explicit. Points obvious when stated, after all, are not always obvious when not stated. The unfortunate tacks others have taken in exercises of this kind attest to that.

(1) *Asymmetric relations may or may not occur in social units, among people acting in their capacities as members of the units. Those that do thus occur may be considered political, others not.*

This criterion subtracts from all power and control relations a large number and variety that are especially far removed from the commonsense conception of politics, often quite amorphous, and likely, if not subtracted or distinguished, to make theories vacuous. Examples are the power of a criminal over his victim or the slow driver over the queues in his wake. Such relations are clearly asymmetric and satisfy formal definitions of control (or power), such as that of Dahl and Lindblom:²² "B is controlled by A to the extent that B's responses are dependent on A's acts in an immediate and direct functional relationship." But they do not occur in social units, or do so only in a trivial sense (e.g., in that they occur among members of the same nation).

To avoid ambiguity, and the kind of definitional carping it begets, we had better be precise about what a "social unit" is (although readers no doubt have an immediate feel for the term).

(a) Social units are not mere aggregates of persons, but, so to speak, collective individuals. That is to say, they have a certain identity of their own, apart from the identities of their members—a fact generally ratified by special proper names (the United States, New Jersey, Princeton University, the Woodrow Wilson School, etc.). They thus persist despite turnover in members, and often have legal status quite apart from that of the individuals that constitute them. They are, in the medieval sense, "corporations," i.e., bodies or entities in their own right.

(b) In such collective individuals, interactions are recurrent and patterned: i.e., they occur continuously, or at least very frequently, and can be generalized about with rather high predictability. They are not sporadic or isolated encounters—not, for instance, the sort of relationship that exists between buyer and customer but the sort that employers have with their employees.

(c) However much the unit may be identified by its members, the members also identify themselves in terms of the unit; in one degree or another their personal identity is perceived by themselves as that of the larger entity. One does not "identify" oneself by saying: "I am a person held up at gunpoint last January

24"; one does think of oneself as "a professor at Princeton University," and the like. The strengths of such personal identifications with collectivities vary, but some tendency to define the self by the collectivity can always be found in "social units."

(d) As corporate entities, social units have goals distinct from those of individual members *qua* individuals. Indeed, individual satisfaction, like individual identity, is itself defined, in some degree, by collective goal-attainment. In the case of families like those Banfield studied in Southern Italy,²³ that definition is extreme, but it exists in virtually all families. As societies "develop," however, the identification of self-satisfaction with collective goals seems to become focused increasingly on larger-scale units, including the "state" and organizations like political parties. Old equations between self and collectivity, by and large, remain, but others (hence other social "units") are superadded. (I leave aside the vexing question of whether there are "rational" collective goods. Empirically detectable nonrational ones suffice.)

(e) As in other "bodies" there exists in social units a more or less specific, or differentiated, allocation of roles or division of labor attuned to the unit's goals, together with definitions of tasks, duties, responsibilities, and rights appropriate to the roles. This, again, is as manifest in small-scale units like families as in large-scale ones, like states. Someone is charged with the shopping, the cooking, the cleaning-up, the bill-paying, much as roles are devised to legislate, administer, adjudicate, push interests, or aggregate votes. The allocation may vary among members almost daily, and also may be quite uninvincible, but generally it both exists and remains fairly fixed, if only because of variations in capacity to perform tasks or expertise acquired in performing them.

We clearly eliminate many of the problems, subjective and disciplinary, raised by the broad conception of politics as social asymmetry by confining the field to social units thus conceived. Most of all, we avoid that of arriving at uninformative generalizations which cover both asymmetry in social units and in encounters among individuals outside of them—generalizations perhaps as vacuous as that the controller tends to command a greater stock of "pertinent values" (force, position on a highway, etc.) than the controlled.

(2) *Asymmetric relations may, or may not, occur among hierarchically ordered segments or members of a social unit, or manifestly affect relations among such segments. Those that*

²² Robert A. Dahl and Charles E. Lindblom, *Politics, Economics, and Welfare* (New York: Harper and Row, 1953).

²³ Edward Banfield, *The Moral Basis of a Backward Society* (Glencoe: Free Press, 1958).

occur among hierarchically ordered segments, or manifestly affect their relations, may be considered political, others not.

Segments of a unit are hierarchically ordered if any of them are thought of as "superior" to others—literally, at a higher level—so that the unit appears to have "stratiformity." (The term is borrowed from geology, to avoid the probably invidious connotations of the more familiar term stratification). In formal organizations, such stratiformity appears on organization charts and, often, through ranking by title: permanent secretary, undersecretary, assistant secretary, etc. In other cases, it is simply a matter of implicit perceptions: e.g., of parents or teachers by children and by themselves.

Stratiformity, in the above sense, is surely a characteristic of governments (as conventionally conceived) and of most other social units. On the other hand, there (probably) are social units in which avoidance of stratiformity is deliberately sought. More important, there are many interactions within a social unit that occur on the same level of its hierarchy and do not manifestly affect relations among the hierarchic levels. Examples are social relations among legislators or bureaucrats, or, in a small-scale unit, certain interactions, unnecessary to specify, between spouses or children in families. Very indirectly, these may, of course, affect relations among the levels (cocktail parties in Washington may promote voting coalitions, or the children's quarrels may turn mild parents into temporary tyrants). But these are usually remote and highly unpredictable effects, like those that encounters outside of social units might cumulatively have on more comprehensive units in which they occur. They certainly do not "manifestly" affect between-level relations in the sociologists's sense of the term, i.e., in the sense of having intended and recognized effects on social relations.²⁴ They are thus not in the least like interactions among nominal peers, such as members of a board of directors, that are intended to make rules for a social unit and recognized to do so.

The second criterion of discrimination thus narrows the field by subtracting interactions within social units that most resemble encounters outside of them, which seems desirable from the standpoint of disciplinary considerations. It also narrows it in a direction dictated by the focus of our subjective interests. But it hardly narrows it extremely.

(3) *Asymmetric relations within social units, occurring among or manifestly affecting between-level relations, may or may not be*

concerned with the direction of the units. Those concerned with their direction may be considered political, others not.

The "direction" of a social unit refers to four matters that are indivisible but distinguishable, and, in any event, have to be discussed serially. One involves a cluster of activities, the second a set of role-incumbents, the third a set of instruments by which the role-incumbents perform the activities, the fourth the activation of a set of sentiments toward the activities, instruments and role-incumbents.

(a) Direction as *activity* involves the general management of the unit: defining its goals and means to attain them; specifying proper conduct within it and, in a sense, "policing" members to assure that their conduct conforms to specification; allocating roles within the unit, together with special tasks, duties, or rights associated with the roles; and coordinating roles and conduct to achieve effective performance in regard to goals or, in a more diffuse sense, to minimize conflict and confusion.

(b) Conceivably all members of a social unit might participate equally in performing these activities on a continuing basis. However, such utopian "communal" arrangements rarely, if ever, exist, nor are they even closely approximated. (In any case, they would not be "asymmetrical.") In virtually all cases, one finds special *role-incumbents* who have assigned or assumed rights or responsibilities to see to the unit's "management," in the various senses of the term. Such role-incumbents may be called the unit's "directors." Their activities in the unit are partly analogous to those mechanisms of control in organic "systems" that keep the organism in equilibrium under stress or prevent stresses from arising in the first place. They are also partly analogous to the activities of engineers who define the objectives of mechanical systems and generate or manipulate structural capabilities and other resources to attain them.

Incumbents of such special roles are always, by virtue of their special rights or responsibilities, superiors of others. However, the term "superordinates" seems more apt a label for them. The obvious reason is that a superior may simply be thought of as higher in status than other unit-members without in any sense being a director in the unit—general status levels and levels of direction need not coincide, and ought not to be made to do so by definition. A superior becomes a superordinate when, in addition to nominal superiority, he exercises a considerable amount of actual control over the unit. Here too, however, a modification, especially stressed by Dahl and Lindblom,²⁵ is in

²⁴ Marion J. Levy, Jr., *The Structure of Society* (Princeton: Princeton University Press, 1952).

²⁵ *Politics, Economics, and Welfare*, p. 94.

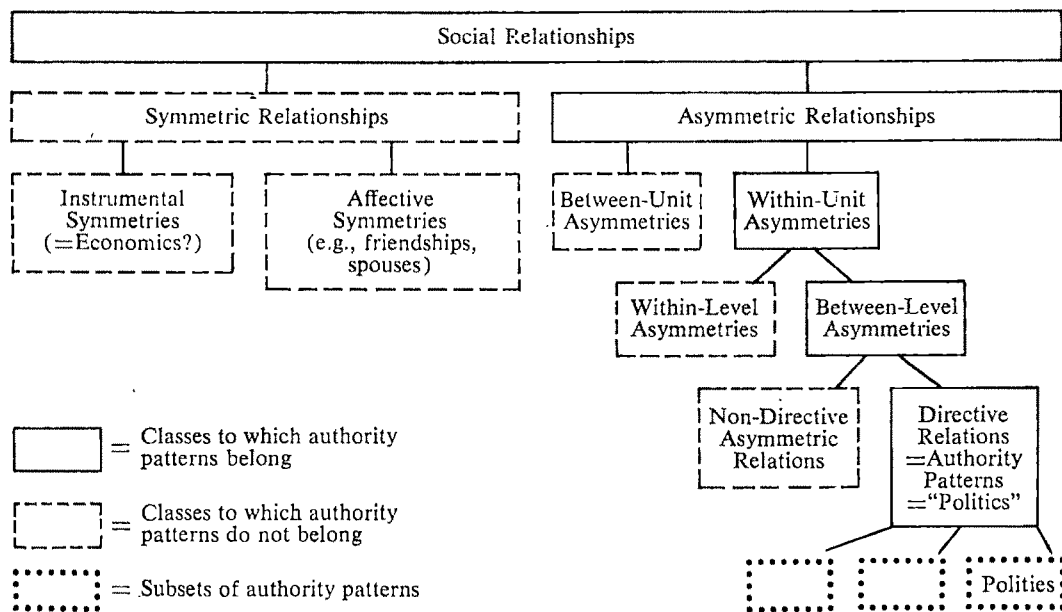

Figure 2. The Place of Authority Patterns in a Taxonomy of Social Relationships.

order. Flows of control between directors and those who are directed need not be, and in fact rarely are, entirely unidirectional. By any formal definition of control, the actions of subordinates can control those of superordinates no less than vice versa, either in latent effect or because manifestly meant to do so—i.e., meant to influence the superordinates' actions. Subordinate actions concerned with directives other than those that merely carry out what superordinates ordain are thus also part of a unit's structure of direction. Such actions may, of course, matter more or less. But even where they are of great import, superordinates have a special role in the determination of the unit's network of direction, either in the sense of quite autonomous power inherent in their roles, or in the sense of aggregating, selecting, or otherwise processing inputs from subordinates, or both.

(c) Direction is carried out by means of *directives*: prescriptions potentially backed by sanctions, negative or positive, if disregarded by unit-members. Directives may take the form of petty commands, broad rules, or implanting in members internalized norms reinforced by the use of deprivations when not acted out. The term "directive" is sometimes used by sociologists and psychologists to denote any guide to action that compels particular choices among alternatives or limits the range of perceived alternatives, and thus reduces the possibility of "anomie" as a psychic condition.²⁶ Here the sense of the term is narrower: not any guide to

action, including all habits and sentiments of morality and propriety, but explicit guides to action within social units, or sometimes interactions with other units in one's capacity as member of a unit.

(d) However, an important aspect of direction, the roles of directors, and the perception of directives is precisely that they do evoke special sentiments of morality or propriety; more precisely, they activate perceptions of *legitimacy*. Such perceptions can be either diffuse or specific. In the diffuse sense, they involve general perceptions of the rightfulness, or justice, of the overall constitution of a pattern of direction, hence its worthiness of being supported. In the specific sense, they involve sentiments of obligation to comply with directives because invested with a special moral quality derived from that diffuse sense of rightful constitution, and therefore of the propriety of punitive sanctions in cases of noncompliance which, otherwise employed, would be perceived as immoral. The perceptions need not be positive. All that is stated here is that, positive or negative, they are evoked. It is inconceivable that such perceptions might not be evoked where obligations are prescribed, where the ability to prescribe them is differentially allocated, and where the behavior used to police and enforce prescriptions is not regarded as morally rightful in any relationship, under all circumstances.

The third criterion of discrimination thus focuses attention on a special cluster of between-level relations within social units. It subtracts relations that are not concerned with their direction in the above senses, which are probably

²⁶ Sebastian De Grazia, *The Political Community* (Chicago: University of Chicago Press, 1948).

the great majority. The reasons for the subtraction again are both disciplinary and subjective. From the disciplinary standpoint, the important points are that "rule" in any form must have to do with rules or their obvious equivalents, and interactions that are not concerned with rules are both extremely heterogeneous (even within units, between levels of stratiformity) and lack attributes of those that are. The most manifestly lacking attribute is legitimacy: they do not activate perceptions of it, but only arouse general sentiments of morality which, in one degree or another, are modified when the quality of legitimacy is discerned. As for subjective interests, the essential point is that "direction," in all the senses given that term here—the management of a social unit, the existence of super-ordinate roles, the prescription and policing of directives, and the perception of special moral qualities that justify rights, privileges, and punitive behavior otherwise deemed immoral or amoral—is intrinsic to commonsense notions of government.

The Nature of Authority Patterns: A Summary

The special class of asymmetric relations delimited by these criteria of discrimination may be called *authority patterns*.

The accompanying figure portrays the way the class was worked out as an exercise in progressive differentiation.²⁷ As should be evident, it implies that some generalizations about social relationships as such should also pertain to "politics," as should some generalizations about all asymmetric relationships, as well as within-unit and between-level asymmetries. Thus, as we pass down the branch-points, an increasing number of generalizations about more inclusive subjects become pertinent to politics; however, the theoretical understanding of politics should also require a good many generalizations about the less inclusive class alone.

The case for delimiting the scope of politics at the indicated level of discrimination still has to be made; so far only groundwork for it has been provided. Before we proceed to that most critical part of the argument, however, two brief sets of remarks are still required. To prevent confusion, my notion of the nature of authority patterns should be contrasted with other uses of the term "authority" and, to make an extensive argument succinct, it should be more directly and summarily stated.

(1) The concept of "authority," like others

²⁷ I am aware that, as a taxonomy of social relationships, the figure (and the argument it represents) is incomplete. The reason is that I am not, at this point, concerned with all social relationships, only with the place of political ones among them. No doubt, however, this involves a weakness: a full, methodical taxonomy of social relationships conceivably might, but probably will not, look different.

of its ilk (power, control, influence) has had a checkered definitional history in social studies.²⁸ The term is probably used most widely as Weber meant it.²⁹ Weber, to my knowledge, never offered a detailed formal definition of authority, and his use of the concept is ambivalent in certain senses.³⁰ He does, however, consistently use it in one way different from the way it is used here. He uses authority as a special quality that an exercise of "imperative control" (in my terminology, direction) might or might not have: *positive* legitimacy. I use it as a label for a structure in which activities, roles, and instruments evoke legitimacy sentiments, *positive or negative*. This avoids some knotty problems eminently worth avoiding: how to measure levels of positive legitimacy; at what level of positive legitimacy "power" (or control, or what have you) becomes authority; whether directors can be "authorities" to some people but not others in the same unit, in regard to some directives but not others, at one point in time but not another; whether the absence of negative legitimacy perceptions equals the presence of positive ones—and many others with which no one has yet managed to come to grips. It is surely enough to know that perceptions of legitimacy are evoked to know also that one is in a special universe of asymmetric relations different from others (for which terms like power or control are quite serviceable).

(2) The proposed conception of an authority pattern can be summarized in a general formal definition, elaborated in more specific definitions that are needed to make sense of the general conception:

General definition:

An *authority pattern* is a set of asymmetric relations among hierarchically ordered members of a social unit that involves the direction of the unit.

Subsidiary and additional definitions:

1. *Social units* are collectivities of individuals that may be regarded as collective individuals (as discussed above).

²⁸ For a sense of the confusion surrounding the term, see Robert L. Peabody, *Organizational Authority* (New York: Atherton, 1964), chaps. 1–2, and Carl J. Friedrich, ed., *Authority* (Cambridge, Mass.: Harvard University Press, 1958).

²⁹ Max Weber, *The Theory of Social and Economic Organization* (New York: Oxford University Press, 1947), p. 153.

³⁰ Note, for example, the following ambivalence in Weber's use of the concept: (1) Authority is held to exist in many types of "corporate groups" (i.e., in our terms, social units) and to involve "the legitimate exercise of imperative control." An aspect of such control is the use of coercion regarded as rightfully exercised. (2) The *state* is defined by its "monopoly of legitimate coercion." Clearly (2) contradicts (1) unless (1) is confined to "stateless" societies. The ambivalence arises, in my view, from the wish—more typical of political scientists than of sociologists—to make too rigid distinctions between politics and other social units.

2. *Hierarchical order* exists where members of a unit are perceived as ranked in levels of superiority and inferiority.
3. *The direction* of a social unit involves the definition of its goals, the regulation of conduct of its members, and the allocation and coordination of roles within it. Direction is carried out through directives prescribed by incumbents of superordinate roles in the unit.
 - 3.1 *Directives* are prescriptions of conduct that evoke legitimacy sentiments. Such sentiments raise the question of whether prescriptions of conduct ought to be regarded as obligatory and rightfully backed by sanctions.
 - 3.2 *Superordinates* are any unit superiors who are assigned, or assume, special responsibility for arriving at directives and seeing to it that they are carried out. (In Dahl and Lindblom's terminology, they are both superiors in the unit and, to a substantial extent at least, its actual "controllers.")
 - 3.3 *Subordinates* are, residually, any other unit members. It should be noted, however, that in cases of complex stratiformity a member may be both superordinated and subordinated vis-à-vis different other members. Sometimes, in cases of complex differentiation along functional lines, a member may be both a "super" and a "sub" vis-à-vis the same other members, in regard to different activities—an ambiguity that disappears if role-incumbents rather than concrete individuals in all their aspects are treated as a unit's "members."
4. *Super-sub relations* (a self-explanatory term) are at the core of any authority pattern: there is no direction of a unit without a flow of directives and actions enforcing them from supers to subs, and cases in which subs do not try to influence supers in some degree and manner are probably very rare. But since supers generally interact in arriving at directives, either as peers or in a special stratiform structure of superordination, *super-super relations*, insofar as they "manifestly" concern a unit's direction, are also an aspect of authority patterns. And since subs may interact in trying to influence the directives of the superordinates, those *sub-sub relations* manifestly concerned with doing so may be considered a further aspect.

The Case for Equating "Politics" with Authority Patterns

My argument is that authority patterns, as delimited and defined in the two preceding sections, are a sensible point at which a decent trade-off between inclusiveness and homogeneity can be struck, and subjective interests reconciled with disciplinary considerations. That argument rests on three main bases. Each of these is addressed to particular difficulties and advantages of conceptions of the field's scope that others have proposed—plus some supplementary considerations that emphasize the sig-

nal importance of studying authority patterns, whether or not taken as defining the subject matter of the field.

(1) *The conception of political study as the study of authority patterns is sufficiently broad (deals with phenomena sufficiently commonplace and frequent of occurrence) to serve as a proper basis for inductive science.* That is to say, the conception serves the purpose of those who first attacked the narrow traditional delimitation of the field's scope, without incurring the disadvantages of the alternatives they proposed.

"Societies"—a term that refers simply to the most inclusive "collective individuals"—consist of very large numbers of such patterns in every case, some very simple and small-scale (e.g., nuclear families), others much more complex and extensive. True, authority patterns at their simplest are not so simple as "acts of control," being clusters of such acts. But nothing prevents "analyzing" them into simpler component units, in any of the ways by which any entity can be analyzed into components clustered in a certain manner: by distinguishing "dimensions" on which they vary, or "elements" of which they consist, or smaller-scale "particles" to which they are reducible. It clearly is unnecessary for inductive science to deal always with the most simple and irreducible phenomena that cluster in entities. In fact, virtually all the very "simple" phenomena of science (cells, chemical elements, molecules, atoms) turn out to be clusters of still simpler phenomena, and failure to arrive at the end of the chain of simplicity—if indeed there is such an end—has not handicapped other fields of inquiry. The main requirement surely is that numbers be sufficient to offset problems arising from range of variability (as argued above), and it is hard to see, *a priori*, why in the study of authority any serious difficulties should arise on that score.

(2) *Defining the scope of the field as the study of authority patterns does not make it so broad as to take us far beyond the range of subjective interests, nor confront us with phenomena so heterogeneous as to make informative theory unlikely or to require much in the way of special disciplinary tools for special types of authority patterns.* That is to say, the definition retains the principal advantages of the traditional narrow conception of the field's scope, without incurring its manifest liabilities.

The methodological reasons for including far more within the scope of the field than state-organizations (and very near equivalents) are important, but by no means definitive. If such organizations were in fact as unique as some consider them, it would be self-defeating to subsume them under a more numerous set of

cases: what is gained methodologically would perforce be lost in knowledge of the subject matter. But state-organizations, and near-equivalents, are not all that unique. They do differ from other authority patterns but only on a very limited number of variables, the import of which for methods and products of inquiry is unlikely to be large.

For one thing, the idea of sovereignty is just that: an idea—and an idea more normative than empirical. The idea characterized well the pretensions of sovereigns as expropriators of authority, and sometimes justified their successes; it also served the longings for peace and harmony of those caught in struggles between competitive, overlapping authorities. But even if indivisible in principle (we leave that to political philosophers), it has never really been undivided in practice—certainly not if taken to involve the autonomous power to make laws perceived as binding and to enforce them with coercion perceived as morally permissible. Being on the official statute books or civil and criminal codes is not all that makes directives appear obligatory. Virtually every social unit has its own set of directives, mostly unchecked by more inclusive authority, and enforces them with more or less severe punitive sanctions, often of a kind considered impermissible among individuals outside of the confines of the unit. And even if there may be appeal to higher authority, that does not much change the nature of the activity. Normative theorists, like the “pluralists,” were the first to perceive this, wishing to deny any unique normative position to the State; empirical theorists ought to follow suit, to deny it any claim to autonomy as subject matter for a discipline.

When comparing state-organizations and other authority patterns subsumed under them by the idea of sovereignty, one finds that the dimensions on which they vary largely coincide. An “analytic scheme” for the less inclusive patterns serves well as an analytic scheme for the more inclusive; a typology of them is serviceable as a typology of “states” as well. We shall really only see this clearly in a set of subsequent papers (now in preparation) devoted to the analysis of authority patterns into constituent dimensions and an attempt to synthesize the analytic elements into clusters serviceable as typology. But we already know from the way the conception of authority pat-

terns—and the probably related variable of complexity. Whether these factors make much difference in regard to disciplinary considerations (concepts, methods, problems, theories) is at least an open question that ought not to be settled by definition, especially by a definition that incurs manifest handicaps for inductive science. Besides, states and near-equivalents vary considerably in extensiveness and complexity, and some “private” governments are certainly larger in size and more complex than many public ones. Size and complexity thus seem more useful as potential explanatory variables (as in a forthcoming study by Dahl and Tufte) than as defining characteristics of a field.

If this general argument is correct, then both parts of the general argument above follow: we do not go far beyond the focus of subjective interests in dealing generally with authority patterns, nor define a subject that is vastly heterogeneous, or even significantly more so than the original basis of the field—taking heterogeneity in the literal sense: not “different” (any concrete individual differs from all others) but “belonging to different genera.”

(3) *The conception of political phenomena as authority patterns helps to identify the equivalents of state-organizations where such organizations do not exist or are not highly developed.* That is to say, the conception serves the purpose of the functional alternatives to the traditional structural conception of the scope of the field, while avoiding the liabilities of purely functional conceptions.

In a sense, all authority patterns are “equivalents” of state-organizations, i.e., belong to a class to which the latter also belong and which, although numerous, discriminates a great deal, since it does not include most human relationships, symmetric or asymmetric. Authority patterns are equivalents of state-organizations even in the various functional senses that have been proposed: they maintain order, integrate, define, and try to attain goals. Moreover, if scale as such is the critical variable that distinguishes “states” from social units included in them, no difficulty arises in answering the question that the functionalists take as their point of departure: “What is the nearest equivalent of state-organization in societies where it does not exist—in, say, Nuer society, or among the Mayas?” No need at all to resort to “functional” equiva-

avoid dubious elements of their definition, such as that they are sovereign wielders of authority, or monopolize legitimate coercion, or alone perform order-maintaining functions in societies.³¹

There is nothing wrong with making a specialty of the study of politics in that sense, or of other subsets of the more inclusive class. Definitions of scope are intended for disciplines as a whole, not for any and all who work in them. What is regrettable is not specialization within a field but equating the whole of the field with the specialty, so that avoidable liabilities are incurred and closely similar subjects neglected.

(4) *Neglecting the study of nongovernmental authority patterns has the consequence not only of leaving unstudied much that is interesting and important in itself, but also of leaving the study of "polities" (however defined) uninformed by much that can be extremely useful for understanding them.* That is to say: even if authority patterns were not taken to define and delimit politics as a discipline, there would be weighty reasons for political scientists to extend their scope of attention to such patterns in all forms. Some of these reasons, however, would not be as weighty as they seem if governments as a special category were vastly more different from other authority patterns than I consider them.

It has often been argued that "private governments" should be far more widely and intensively studied than they are. The reason generally given is not that they are sufficiently like "public governments" to form a subject matter for a single discipline. It is simply pointed out that they exist; that they are interlaced with public authority; and that they are highly consequential—not least for the network of governmental directives that constrain individual lives, provide privileges and rights, and impose obligations, duties, deprivations. The argument, unfortunately, has not been widely acted upon in practice. There are exceptions in political

science, but they are out of the ordinary.³² There are more in other social sciences, particularly in family and industrial sociology, but they too are hardly commensurate with the extensiveness and import of the subject.³³ The consequence, needless to say, is conceptual, methodological, and theoretical retardation. As to reasons for the neglect, there seems to be a growing tendency to consider it part and parcel of a general conspiracy to conceal the networks of power and privilege that dominate supposedly "liberal" societies. Maybe so; but no demons are needed to explain the void. Just as likely is another possibility, i.e., that areas of disciplinary overlap may engender voids as well as duplications. On this hypothesis, political scientists neglect private governments because they are concerned with public ones and do not like to wander far outside their boundaries; other social scientists neglect them because their interests are broader, because they have no specialized competence to analyze them, or because they consider them to fall within the political scientist's domain. One can expect that the current sense of a "crisis of authority" in all institutions in all advanced societies—plus the sense that all sorts of nebulous powers dominate them in uncharted ways—will engender studies that decrease the void. But, on the evidence, studies with normative axes to grind are as likely to retard, or divert, disciplinary advances as to promote them, and they are most fruitful when informed by study conducted from a more neutral basis.

As long as systematic studies of nongovernmental authority patterns are few and crude, we are deprived also of knowledge potentially very useful for making sense of governmental patterns—in at least three ways: (a) Despite pitfalls when one extrapolates from one level of analysis to another, there is much to be learned about macrocosms from microcosms.³⁴ The smaller units, moreover, often accommodate better methods of study, and are more accessible to study than the larger ones. One would suppose that the more the microcosm resembles the macrocosm, the less dangerous the pitfalls and the more directly pertinent the things to be

³¹ The notion of extensiveness in fact figures in some definitions of political systems. The most explicit example is Apter's: *Polities are the most generalized membership units of societies with defined responsibility for maintaining the societies and enjoying a monopoly of coercive power.* Other definitions imply the same more awkwardly: e.g., one of Almond's definitions which includes the notion of an "autonomous society"; or the much earlier one of MacIver which includes the notion of a "territorially demarcated community" among numerous other definitional attributes; or Dahl and Lindblom's notion of government as having "the last word" over other organizations in an "area." See Apter, "A Comparative Method for the Study of Politics"; Almond and Coleman, *The Politics of the Developing Areas*; Robert M. MacIver, *The Modern State* (London: Oxford, 1926), p. 22; Dahl and Lindblom, *Politics, Economics, and Welfare*, p. 42.

³² See Dahl, "Business and Politics," for documentation in one area of private authority.

³³ I refer here to studies mainly concerned with the systematic study of authority patterns—such as that of Peabody. Authority being ubiquitous, references to authority patterns, or potentially relevant materials, may be found in virtually all studies of social institutions, but chiefly in their interstices, between the lines, in connection with other matters, without special emphasis or systematic treatment.

³⁴ A useful work to consult on both points is Sidney Verba, *Small Groups and Political Behavior: A Study of Leadership* (Princeton: Princeton University Press, 1961).

learned by extrapolation. (b) If Easton is right, as he clearly is, in saying that political study (in his sense, discussed briefly in an appendix to this paper) could profit from a general theory of power, then it could manifestly profit even more from a general theory of authority patterns—not, in this case, by extrapolation from one level to another, but by the partial application to less general phenomena of theories about more extensive ones. (c) Even if governmental authority patterns are separated from less extensive ones, the latter are likely to be important explanatory variables for aspects of governmental authority, e.g., on the basis of learning processes, or because they provide links in other senses (mediate between) governmental and strictly nonpolitical variables, such as economic ones, social status or mobility, and so on. I have made an extensive case for using nongovernmental authority patterns as explanatory variables (in theories of stability in democracies or, in a more general sense, performance levels of all kinds of government) in other publications; interested readers should consult these for a full statement of the argument. The general point, however, does not rest only on my arguments. Nongovernmental authority patterns have been used, implicitly, as explanatory variables for governmental ones in hosts of work, and have been so used explicitly at least as far back as Montesquieu, or indeed Confucius.

Note that this delimitation of "politics" is not wholly unprecedented. One can find at least one (implicit) anticipation of it in the modern history of political thought. It is mentioned at this point partly to avoid misimpressions about claims to originality and partly because, indirectly, it adds to the force of my argument. The anticipation (briefly alluded to earlier) occurs in the works of the so-called "pluralists" (Figgis, Laski, Cole) of an earlier period. The pluralists argued, in gist, that the state's claim to sovereignty did not really give it a special *moral* status relative to other social structures. It is true that they were not concerned with the scope of politics as a field of study. They were normative philosophers. Besides, political science hardly existed as a special "field" when they first wrote. However, their arguments did rest on doubt about the very existence of something properly considered "sovereign," or, better, doubt that the special attributes of structures claiming sovereignty made much, or any, moral difference.

How does this reinforce my argument? Simply in that, if the same moral problems (e.g., of rights, obligations, liberty) are raised in a variety of social units, it is probable that descriptive similarities among them are also great. Put differently: if apparently diverse phenomena

pose largely the same problems, moral or otherwise, we may take this as a powerful indicator of their being, despite appearances, members of a common taxonomic class.

Politics, International Relations, and "Political Economy"

Objections to my position are less likely to concern what it adds to the conventional scope of political study than what it seems to subtract. Two apparently subtracted subjects are especially likely to engender demurrals: (1) relations among polities and (2) the nonauthoritative, in general symmetric, processes central to "economic" analyses of politics, such as political bargaining, political coalition-formation, and the adjustment of governmental programs and party positions to voters' preferences.³⁵

These are certainly among the more common subjective interests in political science departments. Moreover, a reasoned case for including both in the political scientist's field of attention can certainly be made. It seems to me, however, that a stronger case can be made to the effect that their elimination from "politics" here is either more apparent than real or else inconsequential. This needs elaboration.

(1) We all know that the study of *international relations* has long played a major role in political science departments. Reasons that this should be the case, as long as polities are central to our concerns, are not hard to find; above all, it is arguable that linkages between the internal affairs of polities and relations among them are such that neither can be properly understood without the other.³⁶ That argument is somewhat intricate, but the basic position is obvious enough to need no spelling out.

The first point to note by way of rebuttal is that nothing said here rules out the study of international relations. Anyone interested in that special subject can still pursue it.

Beyond this, aspects of international relations, as conventionally conceived, are not excluded by the proposed delimitation of Politics—particularly two in which "linkages" are ignored at most obvious peril. One is the study of supranational integration. Authority patterns

³⁵ Much of the recent literature on this subject is summarized in R. L. Curry, Jr., and L. L. Wade, *A Theory of Political Exchange* (Englewood Cliffs, N.J.: Prentice-Hall, 1968), and some of its anticipations are summarized in James M. Buchanan and Gordon Tullock, *The Calculus of Consent* (Ann Arbor: University of Michigan Press, 1962), pp. 323–340. In a sense, most of the literature on political competition, anyway in democracies, is concerned with the subject, even if economic postulates or methods of reasoning are not explicitly used.

³⁶ See, for example, James N. Rosenau, *Linkage Politics: Essays on the Convergence of National and International Systems* (New York: Free Press, 1969).

above the national level fall within the field's scope no less than those below it. In addition, the study of authority patterns can certainly accommodate studies of how they are formed. Every field theorizes about statics and dynamics, and the study of political dynamics is most fundamentally concerned with the processes by which political units come into, or pass out of, being. Processes of international integration surely are processes that develop directive, asymmetrical relations, within embryonic social units, out of relations falling into other taxonomic categories. (That applies to the formation of nation-states themselves no less than processes that, some argue, are now taking us "beyond the nation-state.") The second aspect still manifestly included in politics is, of course, foreign policy, especially insofar as such policy has directive consequences for members of polities.

Nevertheless, other aspects of international relations clearly cannot be squeezed into the proposed delimitation, without procrustean distortion. They fall outside it because they are symmetric in character—more akin to economic market relations than to authority relations; or because they involve between-unit asymmetries; or, farthest removed from our conception of politics, because they involve only indirect impingements rather than "relationships" in the sense of interactions. These aspects of international relations are also "linked" to within-unit affairs, and vice versa; and it is in regard to them that potential disciplinary losses (not losses in status and the like) become serious.

There is reason to think that the losses would not be large, on either side. The disciplinary boundaries between politics and economics, after all, have not prevented studies that link political and economic factors or political studies using economic postulates and methods. Neither have those between politics and sociology, politics and psychology, politics and anthropology, prevented the development of political sociology, studies of political socialization, or studies of primitive political systems. Nor has the fact that economists study markets and sociologists study corporations had very deleterious consequences. Serious scholars who feel compelled to cross disciplinary boundaries do so, paying the price in time and effort. In the case of studies of politics and their relations, the price will certainly not be as great as in many others: neither presently requires mastery of particularly exotic skills or peculiar talents. Moreover, on the evidence, interdisciplinary programs can be useful substitutes for departmental identities, and have the advantage

of allowing one to choose by reasoning rather than brute convention among the disciplines to be related.

Here we come to gains that may offset any losses if departmental divorces occur. It is by no means certain that specialists in international relations are best off as general political scientists. At the student, or even faculty, levels they might be better off devoting more time and other resources to studying international relations as such. They might also learn more that would help them make sense of their subject from other fields (e.g., economics, anthropology) than they presently do from various subdivisions of political science—many of which departmental rules and teaching loads force upon undergraduates, graduate students, and teachers. Given the manifest taxonomic differences between politics and international systems, and the resemblances of the latter to other phenomena, this is, in fact, very likely to be the case. By the same token, as already argued, those who study politics may learn more from studying authority patterns at lesser levels than from the study of international relations: (I say "may" because I do not know enough to say "will." Just for that reason, however, choices should be open, not foreclosed.)

One is struck, in this regard, by the paucity of theories, or even mere theoretical approaches or frameworks, that apply both to politics and to their relations (as distinguished from their linkages), except at very general and uninformative levels. This is precisely what one should expect if taxonomic differences are considerable. And yet, simply because scholarly convention and administrative habit identify international relations and politics, people continue to devote sweat to distracting exercises that might justify the habit. They search for definitions of politics that might cover both international and intranational affairs (not hard to do, but also not very useful). They look for any signs in international activities indicating that they are not absolutely different from intranational activities (also easy, since, of course, they are not). They try to develop perspectives of inquiry, theoretical approaches, and theories that might apply to both sets of phenomena (more difficult to bring off, but certainly also possible at a sufficiently inclusive, and heterogeneous, level). The results are often trivial or embarrassing. It would seem less wasteful, on the face of it simply to work with one's materials, allowing any correspondences to emerge naturally from the work, than to strain after commonalities simply so that habit might appear as reason.

(2) Objections to the possible elimination

from "politics" of *symmetric relations that figure in the making of directives* (as well as in processes of recruitment to superordinate roles) should be taken more seriously. For one thing, such relations are what "politics" is often taken to refer to in general usage—e.g., when distinguished from government or administration. More important, the relations involved do not just play a momentous role in state-organizations; they can occur in any and all authority patterns, and probably do in most.

To disarm objections on this score, it should suffice to say that the study of the direction of social units clearly includes the study of processes by which directives are arrived at, carried out, observed or defied, as well as processes by which those who carry out direction are recruited to their roles. The notion of asymmetry merely provides the first of several criteria of discrimination by which the concrete phenomena of the field are identified. If symmetric relations occur among members of concrete units identified by these criteria, and if these relations are manifestly concerned with the direction of the units (in short, intrinsic to authority), they fall within the boundaries here delimited—just as asymmetric relations among members that are "nonauthoritative" fall outside them.

The elaboration of the general definition of authority patterns (above) points to two aspects of the patterns likely to involve symmetries. One is relations among superordinates (*super-super relations*). Superordinates may work out directives by vote-trading, "side-payments," and other such modes of bargaining to form winning coalitions.³⁷ Such collaboration is not always corrupt or cynical, or even just utilitarian. It would seem that there are cultures in which particular value is attached to collegial behavior and consensual decisions. In cultures such as these, symmetry among superordinates is a general end rather than merely a means for optimizing particular utilities. (It is manifest also that the more a social unit's tacit or explicit decision-rules require assent by numerous participants, the greater the number and significance of symmetries in decision-processes will be.) Symmetries may, of course, also occur in *sub-sub relations* intended to "influence" direction. This does not refer to equal power to influence superordinates. It refers chiefly to exchanges and compromises among subordinates for the sake of forming cohesive influential groups.

Despite all this, it must be granted that the

³⁷ For a list of such possible "exchanges," see William H. Riker, *The Theory of Political Coalitions* (New Haven: Yale, 1962), pp. 108–114.

inclusion of symmetric relations in "political" study introduces an element of dissonance, or impurity, into the proposed conception of politics. Symmetries remain symmetries, no matter how justified their inclusion in studies of asymmetric relations and no matter how often one says that they must manifestly affect asymmetries of a particular kind. The conceptual dissonance can be tolerated. But it should be realized that relations in authority patterns which are not themselves authoritative will at least require theories different from those that are.³⁸

It is altogether likely that the theories required will substantially resemble, or coincide with, those of economics—the field preeminently concerned with "instrumental symmetries" in social relations. (They may also resemble certain theories of international relations, if and when properly formulated.)³⁹ The adaptations of economic theories to political relations are, in fact, already well-developed in a new "political economy" that better merits the label than the old (see note 35). These theories link two fundamentally different, but intertwined, aspects of organized or institutionalized human relations: those in which humans are equals and exchange and those in which they are hierarchically ordered and direct or are directed.

Proponents of economic theories of politics often justify their work on grounds that beg questions one need not beg. They claim that "human nature" is inherently Hobbesian or in some more benign sense value-maximizing, and hence that politics and economics must be governed by the same laws. Or they rest their case on the claim that methodological imperatives (parsimony, the deductive derivation of propositions, predictive or explanatory power) somehow compel working with economists' methods on economists' postulates. All this is probably untrue, and surely unnecessary. The political economists need only claim that concrete political structures and processes contain relations of the sort economic theories are designed to handle, so that such theories are a useful basis (prefabricated, as it were) for partial accounts of politics. How partial or comprehensive these accounts can be is best left to be settled, *a posteriori*, by competition between contending approaches.

This argument has several further implications of consequence.

³⁸ This, in turn, should not really bother anyone. No one has ever held that theories of politics can avoid all nonpolitical factors.

³⁹ If theories resemble both those of economics and international relations, these two bodies of theory should resemble one another. In this connection, note that "entrepreneurial," i.e., economic, theories of international relations are now beginning to emerge. (A good

It manifestly implies that the contemporary political economists' own fixation with state-organization and processes intimately associated with the state (e.g., party competition) is ill advised. Their theories pertain to processes that may occur in any and all authority patterns. Many of these, moreover, are far more suitable to, and accessible for, testing their models—an activity for which they, like other political scientists, are not notable—than are political structures as conventionally conceived.

A second implication is that we should start to develop theories of asymmetric relations—particularly those that occur within social units, between levels, and involve “direction”—as rigorous and fertile as those of instrumental symmetry. Such a counterpart to economic theory certainly does not presently exist even in embryonic form, and the failure of political scientists to define their subject matter surely explains, in large part, why this is the case. In turn, the lack of a powerful “pure” theory of politics helps explain why contemporary political economy is so much more economic than political.

A third implication is related to this point. My argument implies that one should think of “political economy” in two ways, and work toward much greater symmetry of emphasis between them. There is, on one hand, the economics of politics: the study of symmetries in authority patterns. There is, on the other hand, the politics of economics: the study of authority in symmetric relations. I am not referring here to Dahl's still largely unheeded call for the political analysis of business firms as “political orders.”⁴⁰ The subject is much larger and more subtle. It entails study of the ways authority impinges upon symmetry in any and all social units and relations—not excluding economic markets themselves. Except for economists' theories of monopoly and oligopoly, that subject is much less explored than are economic theories of politics. Assuming that the necessary theoretical tools are developed, a political Downs roaming through the economists' domain might, just conceivably, bring off some eyebrow-raising results.

Appendix:

A Note on Easton's Conception of the Political System

The point of this paper, that authority patterns should define and delimit political study, is (as stated in the text) not claimed to be

example is Norman Frohlich and Joe A. Oppenheimer, “Entrepreneurial Politics and Foreign Policy,” *World Politics*, 24 (Supplement, 1972), 151–178.

⁴⁰ Dahl, “Business and Politics,” pp. 3–9.

wholly original—only persuasive. As well as being anticipated by normative philosophers, and following up arguments for studies of “private” governments as important influences on public ones or as not greatly dissimilar from the latter in nature or impact on individuals, it is also in line with points made by many contemporary critics of liberal democracies—especially their argument that liberal governmental institutions conceal oppressive networks of power that act through them or directly constrain individuals. In effect, it simply spells out explicitly what is largely implicit in all these views and rests the case for equating political inquiry with the study of all authority patterns less on normative grounds than on “disciplinary” considerations.

Even in this regard, the argument might appear already to have been developed by David Easton in *The Political System*. Some comments on points of difference between Easton's position and mine are therefore in order.

Easton defines “political acts” as those that “authoritatively allocate values in a society.”⁴¹ A social structure, therefore, is political if it engages in the authoritative allocation of values. The operative term “authoritative” corresponds to mine, and Easton's position, like mine, was worked out by criticism of the very narrow and very broad structural conceptions of the subject matter of the field, to some extent on similar grounds. (The “functional” alternative was not considered by Easton, since it had not yet become current when he wrote—although he also ignores it in his later work.)

If my argument only restated, in a somewhat different way, Easton's position, it could still be justified on the ground that Easton's influence on the conception of the field has hardly been great—except for the mouthing of definitions—and can stand repetition and reinforcement. Actually, however, resemblances between Easton's position and mine are illusory. Easton's conception of politics (as distinguished from his systems approach to political study) has had no discernible impact on what political scientists do, for the good and simple reason that it really only presents a new verbal way to characterize the conventional conception of the field.

That Easton's position remains closely tied to the notion of political structures as state-organizations, or very near equivalents, is evident in this crucial passage:

... in spite of the fact that for the members of [organizations that are not society-wide their] policies carry the weight of authority, it is at once ap-

⁴¹ Easton, *The Political System*, p. 134 (my italics).

parent that political science does not undertake to study these policies for their own sake. Political science is concerned rather with the relation of the authoritative policies, made in such groups as associations, to other kinds of policies, those that are considered authoritative for the whole society. In other words, political research seeks first and foremost to understand the way in which values are authoritatively allocated . . . for the whole society.⁴²

Processes of direction, directive roles, and internal directives in less comprehensive groups thus remain beyond the disciplinary pale. They are considered only as substantive inputs into "polities" (as defined above)—as parts of the "super-sub" relationships of the most inclusive authority patterns, or matters of boundary-exchange between politics and nonpolitical structures.

Why does Easton delimit the field in a manner so closely tied to a conception of it that he attacks? He does it, in the final analysis, because he only takes into account our conventional subjective interests, not any disciplinary considerations—except when he attacks alternatives. At all points where his restrictive conception is stated he invokes as support for it only that political scientists are "not concerned" with a more broadly defined subject matter. This is an explanation of what they do, but hardly a reason for doing nothing else. Besides, it is manifestly untrue, because some of them actually are concerned with more, and it says nothing about what their concerns ought to be. Values are allocated by the "policies" of all groups;⁴³ indeed one can go further and hold that values are allocated in some sense not just by "policies" but in all social relations (asymmetrically or otherwise). Therefore, that part of Easton's definition of the subject of the field which refers to value-allocation is clearly gratuitous. Since all policies of all groups may be "authoritative," that part of the definition of politics also delimits nothing specifically political—a point that should obviously have given Easton pause about making "society-wide" relations the only attribute that discriminates between political and nonpolitical phenomena.

It is not widely realized that the operative part of Easton's delimitation of politics is society-wide relations, nothing else. More attention has been paid to the redundant parts—which appear to say more than the crucial part of the definition. But Easton's own subsequent work confirms my argument: nowhere has he concerned himself with anything other than governments in the conventional sense. My posi-

tion can thus be taken as one to which much of Easton's preliminary argument about the nature of political phenomena leads but that Easton himself never reaches. In that sense, it does not reiterate his views but extends them over a rather similar route toward a different destination.

(Readers might note, in this connection, a curious point about Easton's use of sources. In two places, he cites Sir George Cornewall Lewis's *A Treatise on the Methods of Observation and Reasoning in Politics*, published in 1852—a book that precociously anticipates many current methodological issues in political science. He does not cite Lewis's *The Influence of Authority in Matters of Opinion*, published three years earlier, which attempts to demonstrate that authority pervades all of social life, all groups (as DeGrazia puts it)⁴⁴ having their own "small common goods" and "small authorities" that "envelop us at birth and clothe us throughout life." Easton may simply have missed that work. It is not hard to miss it, for its influence has been virtually nil. The fact remains that it comes closer to what I argue than does Easton's argument itself.)⁴⁵

⁴⁴ De Grazia, *The Political Community*, p. 330.

⁴⁵ Ten years ago I wrote an essay on the development of "comparative politics" from its remote ancestry in Aristotle to the present. (See "A Perspective on Comparative Politics," in *Comparative Politics: A Reader*, ed. Eckstein and Apter [New York: Free Press, 1963], pp. 3–32.) The essay concluded with a problem to which, at the time, no solution had been worked out. As long as political studies emphasized formal-legal aspects of state-organizations they had a certain focus and simplicity. The tendency in the field, for good reasons, was to deemphasize that subject matter. But the result of doing so was loss of focus and simplicity and, as a result, a loss of bearings in regard to what the field was all about, especially as a field of specialization. Political scientists often did not practice what they preached: they continued, in their work, to deal chiefly with state-organizations, while disavowing the reasons for doing so (in the manner of Easton). Or, if they did follow their own prescriptions, they seemed to equate politics with "the whole of social life in all its facets." The problem, then, was to find a different, but still focused and relatively simple, conception of the subject of the field.

The present essay presents my answer to that problem. It also implies that there are two fundamental sciences of society: that dealing with symmetrical social relationships and that dealing with asymmetric ones in social units—"economics" and "politics." Between these, a comprehensive science of social interaction must build bridges, of course, as must many particular explanations of particular social occurrences. Since the science of symmetrical interaction is well-developed (and suitable to what are generally considered "hard" methods of thought and inquiry) there has been a tendency recently to develop "economic" theories applicable to political phenomena. This is a useful tendency. But it would be more useful still if a concomitant effort were made to develop "political" theories of economics—and of politics.

National and Local Forces in State Politics: The Implications of Multi-Level Policy Analysis

DOUGLAS D. ROSE

Tulane University

American national and state governments influence each other within a federal arrangement. This process often dominates state politics but is largely ignored in the study of states and their policies. The first part of this article points up some of the deficiencies in the current knowledge of states which stem from the ignoring of federalism; the second part suggests a refocusing of our studies around the federal arrangement.

Level Problems in the Study of State Politics

The variety of levels of American governments presents some difficulties in studying any one level, especially the state level. Substantively, these difficulties revolve around the political processes associated with the relationships between governments. Technical problems derive from the generic difficulties of level-of-analysis alternatives, of which the most familiar are ecological fallacies. For the main elements of the contemporary study of state politics, the level difficulties are considerable.

A noticeable quirk of most state studies is the treatment of states and only states as policy units. For almost any state policy, quite a number of influences go into and out of policy, and it is doubtful that most of these can be attributed to "states." For instance, most highway building and welfare giving involves the federal government's determining basic parameters and local agents' influencing the applied policy; neither of these factors can be treated in a state-only analysis of the policy, though the actions of state governments are not particularly meaningful abstracted from federal-state-local interaction.

The use of states as units implies that some attribute of the state determines or causes policy, or at least policy differences, among the states. It is not enough that the policy merely "pass through" the state or that state differences are statistically related to policy. The "necessary condition" of having states or state differences for policy does not make states the determinants of policy. If Lyndon Johnson as president pours federal money into Texas or a Washington bureau decides to allocate grants-in-aid on a per capita basis, state policy differences cannot legitimately be traced to the states themselves. Because less than one-fifth of the

money passing through the hands of state governments starts and stays at the state level, state differences are *ceteris paribus* not likely to be tied mainly to state governments. Conclusions about policy or even about state policy based on a simple state-level of analysis have a substantial chance of being wrong.

Furthermore, the type of systems model used in state analysis often interacts with the single-level approach to produce a problem of spurious correlation. The systems model usually examines the interrelations of some subset of past government policy, social and economic parameters, political representation processes, bureaucratic attributes, policy, and policy impact. The beginning assumption is that these factors are independent; actually, nonstate-level phenomena often cause several of the factors at once. The proposed revenue-sharing act, for instance, includes a "tax effort" provision, so that the act would affect both state tax law and state expenditures, producing a correlation which may depend on federal, not state, policy. Poverty funds allocated on a "per poor person" basis have been shown to produce a relationship between state income and state welfare expenditures.¹ Similarly, the lack of relationships can be traced to nonstate factors, as when the federal courts stop states from correlating the black portion of their population with low election turnout.

The systems approach can introduce Galton's problem into relationships: diffusion produces similarity on many variables but there is really only one event occurring—the diffusion itself.² Walker found a host of socioeconomic variables reflecting perhaps one or two actually different factors—related to 88 policies (largely reflecting a single policy innovation factor) for 48 states, which for policy purposes were equivalent to five regions.³ The thousands

¹ See Andrew T. Cowart, "Anti-Poverty Expenditures in the American States," in *State and Urban Politics, Readings in Comparative Public Policy*, ed. Richard I. Hofferbert and Ira Sharkansky (Boston: Little, Brown, 1971), p. 415.

² For a concise discussion of this problem, see Adam Przeworski and Henry Teune, *The Logic of Comparative Social Inquiry* (New York: Wiley, 1970), pp. 51–53.

³ Jack L. Walker, "The Diffusion of Innovations Among the American States," in Hofferbert and Sharkansky, pp. 377–412; a somewhat revised version of this

of relations among these variables strongly reflect a single relation of five items—the association of region and innovation.

The diffusion process itself complicates the understanding of relationships. Nearly 100 national and regional associations of governmental officials diffuse not only policies but also relations between policy and other variables, as between population and form of local government, between taxes and economic structure, and between population density and fire prevention policy. It is usually unclear whether strong relations would exist without the associations, without other state governments as pacesetters, or without bureaucrats oriented to out-of-state events, but it appears that interstate correlations depend on interstate communication in addition to the within-state factors presented in the systems approach.

The information employed in a state analysis characteristically is a single parameter for a single variable. That is, a single score represents the state for each item. Thus, AFDC welfare expenditures in a state, which comprise innumerable payments more or less closely conforming to a multitude of rules, are often indicated by the average payment per recipient. It is rarely clear whether this score is a policy, if so, a state policy, if so, indicative of the entire AFDC state policy. There is considerable room for argument over what constitutes a policy: the rules, the application of the rules, the government actions, the intended consequences, etc. The payments are measured from actions; because in different states the same rules can lead to different actions or different rules to the same actions, the payments do not indicate directly the policy rules, nor would the rules measure policy actions. If analysis is limited to policy actions, it is not always clear that the actions can be attributed to the states. Local governments do most of the welfare paying, for instance, so that the measure of state policy might be best described as the average payment by the average local government. The averages themselves may be misleading. Relatively little

article, found in *Politics in the American States*, ed. Herbert Jacob and Kenneth N. Vines, 2nd ed. (Boston: Little, Brown, 1971), pp. 354–387, indicates (Tables 7, 8, 9) that about half the diffusion depends on four states, one in each of four innovation regions, which provide innovations to states. It would appear, though it is not entirely clear, that California and New York both provide policy models for virtually all other states, that the regionalism largely occurs in accepting innovation from what might be called second-order innovators—Wisconsin, Florida, Illinois—and in the sequence of diffusion (rather than the ultimate source of innovation).

policy action consists in paying the average amount, and the average is indicative of all action only when the distribution of actions around the average is known and is the same everywhere. The within-state distributions are rarely reported or even calculated; where they have been reported, the distributions vary with the policy and differ considerably among the states.⁴ For example, the county average monthly general assistance payments vary around the state average 75 times as much in Massachusetts as in South Carolina, while the state averages show only about 6 per cent as much policy difference. The averages do not index the policy, and the averages may not be the important source of policy differences.

The type of score representing state policy presents statistical problems. In one major study, 88 of 94 variables used were means, percentages, per capita, or otherwise severely altered scores, most commonly derived by dividing one variable by another.⁵ Statisticians are leery of using such scores in a complex analysis, especially one involving powers, roots, and differences, as state policy analyses normally do. The intention of the alteration is to control for some influences, such as size of population, in order to examine other relations more clearly. The division is an inappropriate control: standard least-squares regression should be used, and it should be used on *all* the variables influenced, not just a select few.⁶

The general result of using automatic controls for the impact of population size on policy without a discussion of that impact is to hide a major source of policy differences. California and New York, for instance, are conceded by state administrators to be the primary sources of diffusion, providing models for over one-third of the important, new, and better state

⁴ See Sharkansky and Hofferbert, "Dimensions of State Policy," in Jacob and Vines, p. 346, and Sharkansky, "State Administrators in the Political Process," in Jacob and Vines, p. 266.

⁵ Thomas R. Dye, *Politics, Economics, and the Public* (Chicago: Rand McNally, 1966), pp. 303–309.

⁶ It is standard statistical practice to control for the influence of a third variable on both variables in a relationship. Controlling for effects on just one of the variables produces anomalies, especially in the correlation coefficients. Controls reduce the variance in the "dependent" and "independent" variables by the amount of covariance (weighed) with the "control" variable. The reduction in the variances properly adjusts the base—the estimated maximum covariance—against which the independent-dependent covariance is measured in a correlation coefficient. When only one of the variables is controlled, only one of the variances is properly reduced, leaving an established maximum covariance which is artificially high, so the correlation coefficient is estimated to be lower than it is.

programs.⁷ The reason for their policy leadership lies first in the simple scale of government: they are the largest states. While other forces also influence innovation and diffusion, any explanation leaving out the effects of population size on scale of government and thus on innovation and the other variables is inadequate. Using a population-based percentage measure, as in percentage urban, is not a good control for population: large states are disproportionately urban. The percentage measure ends up partly measuring population size, and the interpretation of its relation with policy becomes difficult. When other variables are not controlled for population—the favored value-added-by-manufacturing is virtually never controlled for population although it is an excellent correlate—population size is reintroduced into analysis without being understood as a size effect, again obscuring interpretation.

Some state analyses, while conceding much of the above, argue that important policy differences among the states can be explained with a state-only systems approach and per capita types of measures. States certainly differ on some policies, but it is not immediately clear that these differences are large or important. One straightforward method of examining the magnitude of state policy differences is to compare them with the differences for the entire U.S. population. The population as a whole varies on policies, such as the amount of state and local taxes paid by persons, and this variation can be measured by the conventional variance formula from statistics. The population variance can then be partitioned into two parts: differences among individuals within a state (deviation from the state mean) and differences among states (deviation of the state average from the national mean). The partitioning is done by a standard one-way analysis of variance formula commonly employed in psychology and sociology and available in standard statistical textbooks. The results of the analysis of variance are directly equivalent to a multiple regression using dummy variables (each state is a variable): the variation among states is the variance “explained” by state differences, the variation within states is “unexplained.” The states’ share of the total variance is directly equivalent to the multiple R^2 (proportion of variance explained, measured by “between sum of squares” divided by “total sum of squares”) using fifty independent variables. Table 1 shows the share of the national population variance on typical policies which is accounted for by differences among the states. If anything,

the table overrepresents the state share of the variance, yet states are not the locus of the main national policy differences. While ultimately political science ought to explain nearly all policy, a sense of priorities should lead us to deal first with the 98–100 per cent of the policy variance which is not accounted for by state differences. Similarly, statistical theory and practice indicate that we can have little confidence in our variables that account for only 1 per cent or even 10 per cent of the variance.

Table 1. State Share of National Policy Variance, Selected Policies, One-Way Analysis of Variance

Policy	Proportion of Variance Explained By States, in Percentages
Selective Service Exam Failures, per examinee ^a	2.13% ^b
Car Registrations, per capita	1.47%
State and Local Taxes, per capita	2.34%
State and Local Employees, per capita	0.10%
Divorces Granted, per capita	0.11%
Policemen, per capita	0.02%
Old Age Assistance Recipients, per capita	0.74%
AFDC Recipients, per capita	0.27%
Aid to the Blind Recipients, per capita	0.01%
Disabled Assistance Recipients, per capita	0.12%
General Assistance Recipients, per capita	0.12%
Unemployment Compensation Recipients, per capita	0.11%

^a The data sources for Tables 1, 2 and 3 are *The Statistical Abstract of the U.S.*, prepared by the Bureau of the Census, U.S. Department of Commerce, 91st and 93rd editions (New York: Grosset & Dunlap, 1970 and 1972). The number of cases ranges from 590,000 selective service examinees to over 200 million total U.S. population.

^b Entry indicates that .0213 (1/48) of national policy differences are reflected in state average policy differences.

On none of the policies do states come close to accounting for even 5 per cent of the policy action differences. The differences among states are not large;⁸ if the differences are to be im-

⁸ A number of authors use the coefficient of variation to establish that there are large differences among states. The statistic is not convincing. The coefficient of variation is meaningful only with a normal distribution and a true zero point, in which case the coefficient of variation for the American population of 200 million (where the lowest case is expected to be over 5.6 standard deviations from the mean) should be less than .18 at the maximum, when the lowest case is zero; if the lowest case is more than zero, then the coefficient of variation should decrease. The coefficient of variation for fifty states, however, is expected to have a maximum

⁷ Walker, “Diffusion of Innovations,” p. 384.

portant, then they must have consequences out of proportion to their size. Table 2 indicates state differences as a proportion of national differences, for some measures of policy consequences. The impacts are indeed out of proportion to the policy differences: they are even smaller. The small state policy differences correspond to virtually invisible policy consequences differences.

Table 2. State Share of National Policy Consequences, Selected Variables, One-way ANOVA

Policy Impact	Proportion of Variance Explained, in Per cent Average
Infant Deaths, per live births	0.02% ^a
Rape, per capita	0.00%
Doctors, per capita	0.01%
Hospital Beds, per capita	0.03%
Mental Hospital Patients, per capita	0.03%

^a Entry indicates that .0002 (1/50 of 1%) of national differences are reflected in state average differences.

It is less than clear that the policy impact variable differences can be easily traced to the policy differences. For instance, while policemen and incarceration are supposed to reduce rape, they all increase together, indicating that the "impact" has more influence on the policy than vice versa. The health impacts, while interrelated, are not strongly tied to state policies. Dye finds little or no relation between differences in educational policy action and dropout rates or mental failures.⁹

In comparison to policy variation, we find that social, economic, and representational differences abound in the states, as indicated in Table 3. State differences in these background factors exceed differences on any policy or impact variable. Several caveats are in order, however. On none of the variables is 10 per cent of the national variance explained by state differences, so states are hardly the key to American social organization. Further, Galton's problem reappears because states' scores are not independent of each other.

of .429 (the lowest case is expected to be about 2.33 standard deviations from the mean). We might expect, then, to find fairly high coefficients of variation in the states. The coefficient of variation is useful only as a scale device for comparing standard deviations on variables in which everything is similar except the magnitude of the scores. Any other type of difference (number of cases, modality of cases, absence of a ratio scale, etc.) will make coefficients of variation non-comparable.

⁹ Dye, *Politics, Economics and the Public*, p. 98.

About half or more of the state variance in industrialization, education, urbanization, percentage black, etc., traces to the census bureau's nine geographical regions. Indeed, socioeconomic and political scores allow a near perfect prediction of what region a state is in.¹⁰ Of course, the differences within states—at, say, the county level—are also considerable.

Table 3. State Share of National Social, Economic, and Representational Variance, One-way ANOVA, selected variables

Variable	Proportion of Variance Explained, in Percentages
Urbanization, per capita	7.65%
Black population, per capita	7.56%
Industrial occupations, per employee	4.32%
Income, dollars per family	2.48%
Education, years per person over 25 years	2.46%
Congressional Turnout, per potential voter	4.28%
Congressional Democratic votes, per voter	2.91%

Almost all major state policy studies use measures of association and relationship based on manipulations of Pearsonian product-moment correlations. In view of the great similarity on policy among states, it is unfortunate that correlations do not indicate the sources of similarity. Rather, correlations assume *a priori* that states should be identical, and they attempt to explain violations of the assumptions. Using correlations in a state-level analysis, there is no simple way to check whether similarities are greater than expected. If the major forces involved in state policy are forces which produce similar policies across states, then the standard correlational analysis can seriously mislead our explanations of policy. The national government, functional associations of state officials, and institutionalized policy diffusion patterns among the states are but some of the forces operating to produce similar policies in the states; correlational analysis does not illuminate their policy role. The magnitude of that role can be partly estimated by the difference between the states' share of national social, economic, and political differences (Table 3) and the states' share of policy differences (Table 1). If states were even random groupings, we would expect the variance shares to be about equal; if the

¹⁰ Robert B. Dishman and Robert F. Craig, "Regionalism, State Policy Outputs, and General Explanatory Models," a paper delivered at the Annual Meeting of the American Political Science Association, New York, September 2-6, 1969; tables between pages 27 and 28.

states are primarily political groupings producing different policies, we would expect the policy variance to be considerably greater than the social and economic variance.¹¹ Because the policy variance among states is much less than that which could be expected from the states' social, economic, and representational diversity, the major task of state policy analysis should be to explain the *similarities* among state policies; correlations are not easily applied to this task.

The combination of individual level data (education, income) and aggregate or macro-level analysis (using states) commonly leads to serious level problems.¹² Often, strong forces at the individual level influence our estimates of higher level relationships. With only a macro-analysis, it is extremely difficult to avoid this contamination. The best estimates of the effects of contamination depend on an understanding of the relationship of the aggregate units to the variables.¹³

Though the grouping of individuals into state units is not an intentional act of analysis, the effects of the grouping are the same regardless of why or by whom it is done. The appropriate universe to measure these effects is the set of relationships at the individual level across the country. If there is a state-level set of effects, it will show up in the total individual relationship in a manner first specified by Robinson and since elaborated.¹⁴ The impact of state-level effects depends on the share of the total variance occurring at the state level, relationships at the state level, and "aggregation bias" relationships across levels which depend on the grouping.¹⁵ All three of these may vary considerably with the grouping method. As Blalock has pointed out, "in shifting to larger units we affect the amount of variation in all variables,"¹⁶ and "contiguity is often the major criterion [for grouping]. But such combinations may . . . maximize variations in either the independent

or dependent variables. If so, the slopes and correlation coefficients will be affected correspondingly." Aggregation bias disappears only with exact equations of one sort or another, which are not the rule in empirical political science.¹⁷ Our conclusions about states as policy units depend on the type of grouping which states represent for policy-relevant variables.

Grouping by states minimizes variance on the dependent variable—policy itself. This is clear both from the absolute share of national variance which occurs between states (Table 1) and from the relative share of national policy compared to social, economic, and representational variance (Table 1 vs. Table 3). Policies are the same across states: they differ almost entirely within states.

For an example, we take the main business of both state and local governments: formal education, through attendance at certified schools. Here the federal government has little control, while states explicitly control education in the localities. If states have a significant policy role, it should show up in education. State differences in the proportion of 5- to 34-year-olds enrolled in school in 1960 account for 0.38 per cent of the national variance. In the age group where the national variance is the least (9-year-olds), state differences account for 0.19 per cent of the national variance. These policy differences are far less than the states' differences on some relevant social variables: states account for 1.42 per cent of the national variance in age and nearly 7.65 per cent of the national variance in urbanization. For all practical purposes, the explanation of the state policies is accomplished by a single national explanation, as for instance in Louisiana, where the enrollment rates for eight age-blocs mirror ($r = .994$) the national rates. If the purpose of state analysis is to examine national or universal patterns, then a single within-state analysis is more representative than a between-state analysis; if the purpose is merely to examine state differences, then the study is trivial. For both purposes, the between-state results are likely to be unreliable.

In using states and grouping so as to minimize variance for policy, the relationship of other variables to policy is changed. Particularly, in minimizing policy variance, the use of states as units controls for most of the valid causes of policy differences, while expanding the scope for random and error disturbances. One signal that this is occurring is that as we move from the individual to the state level, we observe a greater reduction of variance in pol-

¹⁷ Hannan, p. 501 and note.

icy than in the variables supposed to produce state policy. If a constellation of variables largely determines policy, a control for policy should control for the portion of the variance in other variables which is reliably related to policy; the remaining variance on these "independent" items should be unrelated to policy and should be small if the variable is a good predictor of policy. For example, urbanization typically implies greater school enrollment for the national sample; in aggregating by age and state, the valid relationship between urbanization and enrollment disappears, leaving only a small and unreliable ($r = .003$) correspondence. Similarly, age—a good negative predictor of enrollment rates (it is mostly young people who go to school), becomes a weak, positive ($r = .118$) correlate of enrollment when ages and states are aggregated. Because the policy variances involved are so small, however, the aggregate relationship may easily appear strong owing to random influences, as for instance in the strong positive relationship ($r = .454$) of age and 9-year-old school attendance at the state level. Explaining this spurious correlation is neither a major nor a rewarding task. "In grouping by Y [policy], we are confounding the effects of all these variables, this being the very opposite of the direction in which we usually wish to move," according to Blalock.¹⁸ Almost no variable strongly related to policy remains a good predictor of policy when grouping by states because most of the valid covariance disappears, and the remaining covariance is confounded with nuisance variables irregularly related to policy. Variables which are but randomly related to policy increase considerably in potential importance, and a constellation of such variables, randomly related to policy but strongly related to each other, may easily show a series of high correlations with policy at the state level without being in any way truly related to policy. In shifting from a universe of 200 million cases to a group of 50 cases, we invite error, an effect magnified many times when the 50 cases are virtually identical on the dependent variable.

The relevance of correlation coefficients in the analysis of policy at the state level is virtually nil: "Correlation coefficients merely measure the proportion of unexplained variation, which is a function of the degree to which outside variables vary as compared with variation in the independent variable,"¹⁹ a comparison not sensible when the independent variable scarcely varies. Some analysts have argued,

however, that half of the slopes of the regression may be reliable for areal groupings such as states if the grouping effect is known.²⁰ Generally, this is true only for simple cases; when the number of variables and relations exceeds three, and when grouping affects all relations and variables somewhat differently—the normal situation for state policy analysis—the regressions are not likely to be reliable; also, if there is a true system factor at work, its effects can be hopelessly confounded with individual level factors.

The Federal Impact on State Politics

The difficulties discussed in the previous section involved in ignoring level phenomena when studying state politics are so considerable as to suggest not only that level factors need be included in the analysis but also that the salient characteristics of state politics derive from the level arrangements. The study of state politics might well be organized around the federal relation.

Consider elections. State majorities are represented in U.S. Senate and gubernatorial outcomes; to the degree that national party rather than state is the important political dimension, this system can seriously misrepresent political opinion in the country. For instance, in the 1968 gubernatorial elections, Democrats with 51 per cent of the national vote won only 38 per cent of the offices; only 54 per cent of the voters were governed by a man for whom they had voted; while 66 per cent of the Republican voters had a Republican governor, only 43 per cent of the Democrats had Democratic governors. If the election priorities were reversed, with parties being represented first and states second,²¹ overall voter satisfaction would decrease less than one-tenth of one per cent, but party satisfaction would change to 48 per cent of the Democrats satisfied and 60 per cent of the Republicans satisfied. But states do not correspond to a major dimension of voter interest—namely, parties; therefore, elections can seriously misrepresent input through malapportionment.

States as policy-making bodies are justified largely by unique local problems or interests, which a theory supporting both majority rule and minority rights might suggest should lead to different state policies based on differing state interests. Frank Munger's study of public

²⁰ *Ibid.*, p. 180.

²¹ Under such a scheme, the party share of offices would be decided by the party share (to the nearest even percentage) of the national vote, with the N Democratic governors going to the N most Democratic states.

¹⁸ *Causal Inferences*, p. 108.

¹⁹ *Ibid.*, p. 180.

policy and public opinion in the states throws light on this justification.²² For a series of issues, Munger measured both the majority public opinion and the law two years later for each state and each issue. These data, when aggregated, yield two additional measures: the national law (the majority of state laws) and the national opinion (majority of state opinions) for each issue. Munger's original measures show state democracy when a state's laws match its citizens' opinions. The additional measures allow us to examine the relations between a state's opinion and the national opinion, between a state's law and the national law, and between national opinion and national law. When states differ from the national pattern on both opinion and law, we might infer that they are working democratically to accommodate unique state interests. Only on three questions—segregation, aid to private schools, and right-to-work laws—do state interests produce state policy in a democratic manner. On these questions, 39 per cent of the states have publics which, in the majority, disagree with majority national opinion, and 37 per cent of the states have laws which disagree with majority of state laws; state opinion is matched by state law 71 per cent of the time, which is 20 per cent more than expected from the marginals; thus, while the translation of opinion into law is considerably less than perfect, it does approximate democracy.²³ These issues tap directly into the major political symbols of national racial, religious, and class division. The federal government prohibited states from segregating by state law, strictly regulated where it has not prohibited state aid to private schools and encouraged state right-to-work splits as a tactical ploy in a national party conflict. The ability of states to legislate democratically on the basis of state interests on fundamental issues depends on the national government.

The federal role in the fundamental issues is critical because these are the only issues on which states divide or approximate democracy. On 53 other questions, state public opinions agree with national opinion more than 90 per cent of the time, state laws agree with each other 87 per cent of the time, state opinion agrees with state law 57 per cent of the time, which exceeds the agreement expected from the marginals by less than 1 per cent.²⁴ On these

issues—divorce, gun control, abortion, police strikes, gambling, etc.—only ¼ of 1 state can characteristically be considered democratic. Slightly more democracy is produced by states following national trends rather than within-state events (state opinion agreeing with national opinion and state law diffusing from other states). Contranational state public opinion corresponds to state law only 37 per cent of the time—well below chance (which is 50 per cent for these dichotomous issues). States are controlled by the federal government on divisive issues and are not operationally democratic on other issues. Democracy in the states would be considerably improved if policy making were nationalized (by passing a uniform law whenever ¾ of the states' statutes agree), so the states are not particularly effective even at diffusing national trends democratically.²⁵ Autonomous states do not protect unique state publics from disagreeable national trends; to the degree states differ from substantial national trends, they tend to frustrate their citizens.

In spite of their critical constitutional position, states are not well received by the public, which pays less attention to them and trusts them less than other levels of government. By a considerable margin, citizens think they get less for their tax dollars from states than from other levels and that for comparable policies states are more unfair.²⁶ In their politics, citizens are nationally and locally oriented. Party identification, for instance, is national. For House of Representative elections in the 'fifties, states characteristically contributed only 1½ to 2 per cent variation in turnout and party vote.²⁷ With any disconnecting of state politics from national politics—through nonpartisan or odd-year elections, for instance—citizen involvement and understanding tend to drop drastically. For the governed, states have a secondary and largely derivative role.

The increasing gap between the nominal constitutional role and the actual role of the states poses some problems for traditional justifica-

²² The uniform national law, while improving opinion-law democracy, removes the possibility of further innovation on that policy. Although a variety of mechanisms (such as time limitations on the uniform law) could remove this disability, the whole suggestion is an academic standard rather than a practical proposal.

²⁷ *Ibid.*, Table 1.

tion of state politics. The nationalizing of politics includes an individualizing of politics and an increased role for non-areal groups, while diminishing the significance of states. The Democratic party has decreed that individual Democrats, not areal party organizations, comprise the national party and should get represented at national conventions. The increased orientation to policy for voters and parties increases the party role while decreasing areal factors.²⁸ Public opinion differs little among the states, and so do laws. In this situation, the traditional argument for states as representatives of local interests and democratic units carries little weight.

Across time, states have been diminishing in their importance and diversity. Table 4 presents the average standard deviations for states in partisanship in the presidential elections. States have declined as locales for national political controversy.

Table 4. Average Standard Deviations of Presidential Percentages of Popular Vote in States, 1900-1960*

Decade Midpoint	Average Standard Deviation
1900	16.8
1910	15.3
1920	15.2
1930	13.7
1940	12.7
1950	9.1
1960	8.1

* Adapted from Frank Sorauf, *Party Politics in America*, 2nd ed. (Boston: Little, Brown, 1972), p. 52.

Hofferbert and Sharkansky report steadily decreasing socioeconomic and policy variation among states since 1890 and indicate that the connection between these factors has been weak, as with the correlation between per capita income and state and local spending, which decreased from .93 in 1903 to .56 in 1964-5.²⁹ Although the differences diminish, the states

²⁸ For discussions of the changes over time in voters' orientations to parties, see John C. Pierce, "Party Identification and the Changing Role of Ideology in American Politics," *Midwest Journal of Political Science*, 14 (February, 1970) 25-42; David E. RePass, "Issue Salience and Party Choice," *American Political Science Review*, 65 (June, 1971), 389-400; John O. Field and Ronald E. Anderson, "Ideology in the Public's Conceptualization of the 1964 Election," *The Public Opinion Quarterly*, 33 (Fall, 1969), 380-398; and Gerald M. Pomper, "From Confusion to Clarity," *American Political Science Review*, 66 (June, 1972), 415-428.

largely maintain their respective positions; for instance, the rank-order correlation between Hofferbert's industrialization factor in 1890 and in 1960 is .72.³⁰ Similarly, state policy innovation patterns during the long period of Republican dominance are largely the same as during the current period, though total policy differences among states have been diminishing.³¹ Thus, the nationalization of American society has not particularly implied any major redistribution among states.

The increasing similarity among states over time runs counter to several common models of integration. Changes are not randomly distributed around earlier differences, so the process of change is directional. The similarity does not follow a model of clustering and complementary location which individuals, corporations, etc., left to their own devices tend to follow. Nor do the changes follow the trends of state policy differences, which on the whole would lead to increased dissimilarity over time. The increasing similarity most closely resembles the pattern which would be produced by strong, uniform policies, either in the form of national policies or in the form of similar state policies. The similar state policies could derive from the imposition of national norms or from cooperation and imitation among states.³² The policy similarity cannot derive from similar internal policy-making politics, for these would decrease the resulting similarity. Thus the broad trend is for national patterns to override state differences in policy making and the consequence is increasing similarity among states in the effects of policy.

The formal similarities between state and federal governments are misleading. Despite the nominal commonalities including single chief executive, bicameral legislature, plural-member supreme courts, formal constitutions, Democratic and Republican party cleavages, formal areal representation, civil service, and the obvious similarities in political culture and socioeconomic environment, states do not resemble the federal government in their actual operation. Indeed, for all the formal dissimilarities, local governments are closer to the national government than are state governments. Primarily, states cannot usefully be viewed as political systems (or economic systems or social systems), while the nation can be.³³ Briefly,

³⁰ "Socioeconomic Dimensions in the American States," in *State and Urban Politics*, pp. 456-457.

³¹ Walker, "Diffusion of Innovations," pp. 360-361, and column 1, Table 6, p. 377.

³² Competition among states might also be a source of convergence. The states are unequal competitors, however, so highly similar policies might not result from competition.

³³ For a similar suggestion, see Herbert Jacob and

this means that virtually all parts of state politics are more closely connected to factors outside the state than to other political elements within the state. States are collections, on an areal basis, of assorted subsystems of national and local politics. The preceding presentation of data on social, economic, representational, and policy patterns illustrates the close connection of states to a national pattern. The connections within states are weaker and more variable, partly of necessity—what in Louisiana could be correlated with school enrollment rates more than $r = .994$, which is the connection with national enrollment rates? The correlation of state “industrialization” with state Democratic presidential vote varies from $-.38$ to $.35$ during the period 1890–1960, for instance.³⁴ Mostly, the correlation of items for states follows the national correspondence. State policies are not, therefore, the “outputs” of a state system with state “inputs.” Rather, state policies are mainly the product of national policy trends, between-state communications and imitations, local within-state interests, and some state level political and socioeconomic considerations.

Any adequate model of state policy making cannot build in the predominance of state forces. Rather, the importance of state forces is one of the main characteristics of a state or of a policy. For instance, the highest correlation ($r = .425$) of state democracy for Munger’s data is with states’ absolute deviation from the average innovations pattern. That is, states which are democratic *either* lead in innovating or refuse to follow policy diffusion; in both cases the rejection of the national state policy norm produces more cohesion between policy and opinion within the state. For particular policies, national norms may allow more or less room for state influence. Differences among states’ school enrollment rates for five-, six-, and nine-year-olds account for 12.1 per cent, 7.1 per cent, and 0.2 per cent, respectively, of the national variance, so national norms are less strong as an influence on states’ policies for the younger age groups. For the states with the lowest overall enrollment (Alaska) and the highest (Utah), the 5- to 16-year-old age deviations are strongly correlated ($r = .80, .79$) with the level of national norms; states differ most in the tangential aspects of enrollment policy and differ little when enrollment is critical. Though deviations for the most variable enrollment group—five-year-olds—are related to state

characteristics such as innovation and urbanization ($r = .62, .56$), these relations largely occur as a result of between-state interaction; for instance, 73 per cent of the enrollment-innovation relation results from the six state regional innovation patterns, and 67 per cent matches simple geographical contiguity as indicated by the Census Bureau’s four regions. Most of the remaining relation between urbanization and enrollment validly indicates that, within states, urban areas have a higher enrollment rate for six age groups than do rural areas, a relatively uniform national pattern. The state policies thus depend on a variety of levels of influences, as well as a variety of influences within levels. There might well be a general zero-sum relationship between the impact of national forces and every other influence.

A final salient characteristic of states is the existence of two separate major dimensions in the politics of policy making. Analysts differ on the exact nature of these dimensions. Hofferbert and Sharkansky suggest that they consist of citizen representation (“competition-turn-out”) on the one hand and bureaucratic performance (“professionalism–local reliance”) on the other hand.³⁵ The dimensions involve different demographic factors and operate largely on different policy areas.³⁶ Somewhat equivalently, Walker’s innovation and Munger’s opinion-law democracy are major, separate policy-making dimensions which suggest a bureaucratic and a citizen representation factor. While the analyses are not completely comparable, both suggest a largely “internal” and a largely “external” dimension operating in policy making, each tied to its own sector and reflecting different, rather autonomous, national forces.

Some of the consequences of the dimensions are suggested by a detailed study of four states.³⁷ Munger’s opinion democracy relates directly to the policy accountability of incumbents in elections, and Walker’s innovation scores match the behavioral index for governmental legitimacy (see Table 5). Innovation seems to produce legitimacy (or perhaps legitimacy allows faster diffusion), while electoral accountability for policy seems to produce opinion-law democracy.³⁸ As with innovation and democracy, policy accountability and government le-

gitimacy are linearly unrelated, but increases in policy accountability produce deviant legitimacy scores. That is, accountability and democracy lead away from the normal pattern of mild innovation and mild legitimacy.

The striking characteristics of state politics appear to derive from level effects. The level effects may produce interaction within states, leading to some broad differences in the types of politics occurring in different states.

The basic elements of state politics from constitutions to family structure to traffic laws are national, both in the sense of being fairly uniform across states and in the sense of national change occurring. These national changes do not result from similar intrastate processes but rather occur with similar interstate and state-nation processes. The basic pattern for state politics is for each element to be largely unrelated to any other element except through their relations with national patterns, which themselves may be causally connected. States are not political systems, though they are parts of a political system.

Within this basic structure, state departures from national patterns reflect past departures minus the relatively uniform impact of national policy. The total amount of differences across states on any element mostly indicates the impact of national policy on that element: policy itself shows small differences, while largely unregulated elements, such as urbanization or religious preference, show noticeable differences.

For most states, political activity is regular but not strenuous. The electorate selects potential national officials, holds taxes down somewhat and supports education; bureaucrats suggest and implement standard laws; legislators adopt the standard laws and cut budget re-

quests. The connection between one activity and another is tangential or small.

As long as the national pattern is functional and the state differences from national patterns on any element are not important, or not related to differences on other elements, then states can function as rote conduits of national patterns. But if the national pattern becomes dysfunctional, then states need to become systems. The 1929 crash and the contemporary school busing issue are perhaps instances. There is little evidence that states do become systems in these instances, and there are compelling reasons why they cannot do so. States do not control their borders, or the large part of their commerce which is interstate, or their basic political arrangements, or the host of other factors which they would have to control to be political systems. It is unlikely that even if they could control these, states could institute major change in the required short period of time. The national government, of course, is unlikely to allow states to control such matters, for to do so would eradicate the national system (whose priority was more or less established by the Civil War).

State differences from the national pattern on any element are likely to be important only when the differences are large and the item is fundamental. Aid to parochial schools in Catholic states, the closed shop in industrial states, segregated schools in Southern states are illustrations of such differences, as are the severance taxes in states heavily dependent economically on mineral extraction. Because states are not normally systems, it takes an enormous amount of unified political power to get them to operate as such. Mass coercion from a relatively homogeneous electorate is likely to be a

required ingredient in the application of power to produce deviant policy. Aside from the considerable difficulties involved within the state in producing deviant policy, two additional constraints operate. First, the national government may not allow the policy. Second, the basis on which the power and policy rest will, in the normal course of events, erode over time as national policy on other matters decreases dissimilarities among states. It is quite possible to have a mildly coherent state mobilization system which cannot govern in accord with the politics, or a deviant policy whose political justification has eroded, or both occurring in separate policy areas.

Interrelated state differences from the nation may produce consistent differences across a range of policies. While it is possible for a state to operate systematically to produce the consistency, this would require that the differences be of major importance. What is more likely is that marginal consistency is built in at some stage of policy making. Regional policy diffusion appears to occur because administrators take account of patterned differences; the matching of law and public opinion to produce consistent deviation tends to occur as legislators perceive consistent interrelated policy preferences (ideology) in the electorate.³⁹ Such consistency amounts to being above or below, faster or slower than the national pattern; it is limited by the pattern itself and by the lack of completely interrelated state differences from the nation. Because the national pattern is a moving pattern which carries states ever closer to itself, even policy deviancies based on built-in accommodation of interrelated differences are likely to be unevenly and generally decreasingly deviant.

Most states are not systems but reflectors of national patterns. Some states which regularly precede or lag behind the national pattern on many elements may behave as if they were systems in part, but the operating consistency resolves to mechanisms in the bureaucracy or representation process for adjusting the national pattern. Some states with important differences from the nation may have a systematic politics or basically deviant policies, but the system arises in response to the national pattern, and the existence of deviant policies depends on the national government. In all these cases, whether or not the state is or appears to be consistent, the national pattern is the dominant influence. The national influence operates most massively in a direct causal fashion, but

even differences among the states' patterns of politics arise in reaction to state-national differences. In understanding the politics of any state, the most important information to know is the national pattern.

States whose electorates' preferences differ either consistently or importantly from the national pattern are more likely, as in Mississippi and Oregon, to exercise policy control over incumbents through elections, producing a closer-than-average (though hardly perfect) correspondence between public opinion and state law—democracy. Such states are better able to withstand national electoral trends—the pro-Democratic 1958 and 1964 forces, for instance—than are states such as Vermont and Wisconsin.⁴⁰

The existence of a relatively coherent state political system like those in Oregon and Mississippi, based on differences from the nation, tends to produce deviant policy, reflected in Oregon's high innovation score and Mississippi's low score, as legislators and administrators either build in the preference differences or build in factors which are related to preference differences.⁴¹ Because the systems are not complete and because national patterns continually change, neither state is thoroughly deviant. It seems likely, however, that all states are more deviant on policy than could be expected simply from the strength of the representational arrangements; this suggestion is consonant with the notion of relatively autonomous forces in administration which operate as though there were a coherent democracy.

State differences from national policy patterns have quite divergent consequences depending on their direction (i.e., whether they are ahead of or behind the national pattern). Because the national pattern over time tends to be unidirectional, the continuance of that trend requires the national government to allow states to innovate in the direction of the anticipated pattern, and this requirement is usually met. The national government allows innovative de-

³⁹ Rose, "State Elections Systems," p. 215, pp. 158-159.

⁴¹ Wisconsin's innovation and progressive policies on welfare-education appear rooted in earlier state-national differences associated with the Progressive movement and continued through the state bureaucracy which is one of the major monuments of progressivism. The bureaucracy itself can continue as "too" innovative for the state because, as discussed in the text, it is highly functional for a state to be innovative. The origins of the Wisconsin progressive deviancy can speculatively be traced to the deviant "administrative" culture of the large German population, the availability of the progressive movement, the alienation from the Democratic party in World War I, and the feudal electoral politics associated with the La Follettes.

³⁹ Munger, "Opinions, Elections, Parties, and Policies," pp. 30-31.

viancies (such as segregation in the 1890s, primary elections, divorce leniency, permissive abortion, etc.) when they are first initiated and if they represent a trend which fits with the rest of national policy. State policy deviancy which lags behind the national pattern, however, eventually gets revoked or undercut by national policy. Thus the long-term policy consequences of state deviancy depend on the direction of deviancy with regard to the national pattern. States in advance of the nation are supported by national policy, and even where the policy is in advance of state citizen preferences, the effects of national patterns will eventually make the policy appropriate for the state. States which lag behind the nation get undercut by national policy, either directly or through the overtime workings of national policy impacts. It is this asymmetry which appears to produce the close relation between policy innovation and the legitimacy of state governments to their citizens.⁴² Over time, either directly or indirectly, laggard states will have a high proportion of ineffective or inappropriate policies—a

⁴² One possibility is that the legitimacy that the national government has for a state's citizens may correspond (partially) to the legitimacy of the state government, for the same conflictual process affects both of them.

tendency which is likely to lower state legitimacy. Similarly, innovative states receive a legitimacy bonus over time.

The above is a hypothesis about why most states are mildly democratic and legitimate and others are moderately democratic and illegitimate; the democracy and legitimacy are related in all states, but the relation in addition to the scores depends on the state-national contrast for a variety of elements. It should be re-emphasized that the differences among states are marginal—that is, no state is very systematic, democratic, or innovative. The forces of nationalization are so strong that they dwarf as well as create differences among states.

Summary

Studies of state politics which ignore events and relations at other levels are severely limited in their usefulness for both methodological and substantive reasons. The salient elements of state politics do not derive from relations within states, so it is necessary to examine external relations of states, especially relations to national patterns, to understand state politics. The basic dynamics of state politics may be rooted in the impact of national patterns on states and the reactions of states to those patterns.

Innovation in the States: A Diffusion Study*

VIRGINIA GRAY

University of Minnesota

In the past decade political scientists have witnessed an outpouring of literature on state policy outputs. Although policy is generally acknowledged to be a multidimensional phenomenon, comparative state policy research, with a few exceptions, has had expenditures as its primary focus. One of the few nonmonetary dimensions investigated previously was innovation by states.¹ This article seeks to extend in a more rigorous fashion the investigation of innovation by states.

Introduction

An innovation is generally defined as an idea perceived as new by an individual; the perception takes place after invention of the idea and prior to the decision to adopt or reject the new idea.² In this study, as in Walker's, an innovation is more specifically defined as a law which is new to the state adopting it, i.e., it is equivalent to a single adoption.

The observable data are the adoptions by states of particular laws. When states first learned of the idea is unknown. The data do not encompass new ideas or practices adopted by the state's bureaucracy, nor do they include "disadoptions" by means of a state court's declaring a law unconstitutional. In practice, innovation may stimulate huge appropriations or it may have little monetary impact if the program is adopted but never funded. Consequently, there is good reason to study the process by which states adopt new ideas as well as the process by which they maintain existing programs, i.e., expenditures.

The laws under consideration here are from issue areas central to the "have have-not" struggle, described as the essence of politics by V. O. Key, Jr.³ It is more likely that a political explanation, not an economic one, can account for differences in selected "have-not"-oriented policy areas than it can for the broad range of

policy areas included in some studies.

The policy areas selected are education, welfare, and civil rights. Education was singled out by Key as an arena of "have have-not" conflict;⁴ welfare was the focus of Cnudde and McCrone's study specifically because of its centrality to the "have have-not" struggle;⁵ the adoption of civil rights was the focus of a study by Lockard, one of Key's former students.⁶ Within the areas selected there is some potentially interesting variation: Education is probably less "have-not"-oriented than the other two fields; civil rights innovations ordinarily would require less funding than public welfare or education programs.

Insofar as possible, the laws selected were ones whose adoption was free of federal influence because in expenditure analyses it has been found that federal spending often has a substantial impact on state and state-local spending patterns.⁷ Some of the laws considered here were enacted by states prior to the federal government's entry into the field, e.g., public welfare laws before 1935. Others deal with subjects exclusively in the state's jurisdiction, e.g., teacher certification. This distinction between federal stimulation and state initiative is not made in Walker's exploratory work. Walker treats the dates on which states began to participate in federal grant-in-aid programs the same as the dates states adopted laws independently. Hence, the results of the two efforts may vary somewhat.

The laws also were selected for the durability of the issue; it took a long time for all states to adopt any one law. Indeed, the data extend back as far as the 1780s in one case. In some instances the process of adoption by all states is not yet complete. All laws in the three policy areas which meet these criteria and whose dates of adoption were summarized in available sources were selected. Table 1 lists the laws, the time periods during which they were adopted,

and the number of states adopting them.

Using this data base, we will consider three questions: (1) How do new ideas diffuse or spread among the states? They may diffuse like many other new ideas, through user interaction. If this diffusion process is regular, i.e., predictable, a dynamic model of the process can be constructed. Comparison can be made between policy areas to ascertain how diffusion differs according to the issue involved. (2) Why are some states more innovative than others? The common hypotheses relating competition and economic resources with public policy will be tested and the results compared by issue area. (3) Are there identifiable patterns of innovation? An effort will be made to determine if the same states are innovative in all three policy areas.

Diffusion of Innovations

The process by which an innovation spreads is called diffusion; it consists of the communication of a new idea in a social system over time.⁸ Diffusion research has been carried out in the disciplines of: anthropology (e.g., the diffusion of cultural traits among primitive tribes); rural sociology (e.g., the diffusion of hybrid seed corn among farmers);⁹ medical sociology (e.g., drug adoptions by physicians);¹⁰ education (e.g., some 150 studies made at Columbia University under the direction of Paul Mort); industry (e.g., the diffusion of a new product among consumers); political science (e.g., the diffusion of city manager governments in the 48 states);¹¹ and medicine (e.g., the contagion of a disease).¹²

Empirical investigation in rural sociology, sociology, and education has demonstrated that for a wide variety of innovations, the frequency of their adoption over time is normally distributed; their cumulative distribution over time has the "S"-shape of the cumulative normal curve.¹³ Three explanations are offered in the literature for this repeated finding:

(1) The time of adoption for any given case "is determined by the interplay of an infinitely

large number of elements in the social milieu," thereby fitting the requirement of the normal distribution that "the value of each event is the

result of the chance combination of a great many minute and relatively equal factors."¹⁴

(2) The cumulative normal curve is similar to an individual's learning curve which is "S"-shape in its cumulative form. Adoption by a state is then equivalent to a learning trial by an individual.¹⁵

(3) There is an interaction effect, i.e., adopters influence those in the social system who have not yet adopted. As more persons adopt, the effect on nonadopters increases.¹⁶ Actually, the normality or non-normality of the adopter distributions is independent of the theoretical assumption that ideas spread because adopters somehow influence nonadopters.¹⁷ Other curves, particularly the logistic curve of population growth, have been widely used to fit the same kind of data (innovations) with the same goodness of fit.¹⁸ The interaction explanation is more appealing on substantive grounds; observers of state governments point out that decisionmakers emulate or take cues from legislation passed by other states. Indeed, this function is institutionalized in the Council of State Governments, financed largely by states. Walker argues that this competition of ideas largely determines "the pace and direction of social and political change in the American states."¹⁹ Thus, in formal diffusion theory and in Walker's application of it to state governments, one assumption is that gain in adoptions is due to nonadopters' emulation of adopters. In the following section a simple interaction diffusion model is developed and then evaluated using the twelve laws being studied here.

A Diffusion Model Based on Interaction. The rate of spread of adoptions can be denoted by ΔA_t and is some function of those already adopting:

$$(1) \Delta A_t = f(A_t),$$

where A_t is the cumulative proportion of adopters in the t th year and ΔA_t is the difference in the cumulative proportion of adopters at t and $t + 1$, defined as $\Delta A_t = A_{t+1} - A_t$.²⁰

¹⁹ Walker, "Diffusion of Innovations among American States," p. 890.

²⁰ For explanation of the application of difference equations to social data see: Samuel Goldberg, *Introduc-*

The most elementary way to consider the function f is as the number of pair relations between adopters and nonadopters or simply their product. This interpretation assumes that the population is completely intermixed, i.e., that "leaders" from each adopter state come in contact with "leaders" from each nonadopting state. Furthermore, the model omits diffusion from other sources, e.g., innovation stimulated by the minimum standards attached to federal grants-in-aid.²¹

If the proportion of adoptions is proportional to the interaction between those who have adopted and the potential adopters, then f could be expressed as:

$$(2) f = bA_t(L - A_t),$$

where b is the coefficient of diffusion from interaction,

L is the maximum possible proportion of adopters for a particular law, and

$L - A_t$ is the pool of potential adopters in year t .

If $L = 1$, all states have the potential for adoption. There are compelling reasons, however, why every state will not be susceptible to adopting a particular law: Hard-to-amend limitations in the state's constitution or values of the political subculture might cause a state's leaders to be practically immune to diffusion from interaction. Therefore, L , the limit on the pool of eligible adopters, should be treated as a parameter to be estimated for each law.

By substitution,

(3) $\Delta A_t = bA_t(L - A_t)$ and, after rearranging and decrementing the index t ,

$$(4) A_t = A_{t-1} + bA_{t-1}(L - A_{t-1}).$$

The cumulative proportion of states having adopted any law at year t depends upon the proportion of states retaining the law plus some proportion b of the interaction between previous adopters and eligible adopters. The coefficient of the first term, A_{t-1} , is set equal to 1, implying that all states which adopt a law keep it. Although this assumption is not strictly true in all cases (e.g., states may retain a law but

tion to Difference Equations (New York: John Wiley & Sons, 1958).

²¹ More elaborate models could be constructed in which there is diffusion from a constant source like the federal government, or in which there is incomplete mixing of the population, e.g., regional or professional communication networks may produce distinctive diffusion patterns. For these more elaborate models see: James S. Coleman, *Introduction to Mathematical Sociology* (New York: Free Press of Glencoe, 1964), chap. 17.

not enforce it or states may revoke laws, as Mississippi, South Carolina, and Virginia have done for compulsory school attendance), the data sources are not systematically informative on this point. Hence, this model does not allow the process to go "backward."

By rearrangement, the equation becomes

$$(5) A_t = 1A_{t-1} + bLA_{t-1} - bA_{t-1}^2,$$

whose parameters can be estimated by the following regression equation:

$$(6) A_t = (1 + bL)A_{t-1} - bA_{t-1}^2 + c + e$$

where c is the intercept and

e is the error term.

If the intercept c is near zero, and if the error, e , meets standard expectations, then regression may furnish useful estimates of b , the contribution from interaction, and L , the maximum proportion of states susceptible to adoption of any one law.²²

The interaction model was evaluated using as observations the cumulative proportion of states having adopted a particular law. Figure 1 below displays an example of the fit of the curve predicted by the model for adoption of the twelve laws. The squared term of the equation causes the regression line to depart from linearity and allows the "S"-shape characteristic of some cumulative adopter distributions.

The fit of the regression line is very good for all twelve laws, as Table 2 shows. Relying upon

²² J. Johnston, *Econometric Methods* (New York: McGraw-Hill Book Co., 1963), p. 7.

R^2 as the goodness-of-fit criterion, one can observe in column 1 that the variance explained ranges from .9380 for AFDC to .9976 for high-school degree requirement. Referring to the graphs, one will note that when adoptions are plotted over time, the high-school degree requirement data (Figure 2) approach a normal curve, but AFDC (Figure 3) presents quite a different picture—a damped oscillatory pattern.

It was stated previously that the error must be small and the regression constant c must be near zero in order for true estimates of the parameters to be given. As Column 2 of Table 2 shows, the intercept is very close to zero except in one case. That case is AFDC, whose intercept is .1320; that figure is sensible when you examine its graph (in Figure 3). The third column of Table 2 reports the error of the dependent variable relative to its standard deviation. The standard errors are rather small; again AFDC is the most aberrant. Therefore, by these criteria the simple model fits fairly well for these twelve laws.

Another basis on which one can evaluate the fruitfulness of the model is to examine the parameter estimates. Columns 4 and 5 of Table 2 allow for comparison of the estimated value for the parameter L and the last observed value. For eight of the twelve cases, the estimated value is close to the observed value; in two cases, the observed value is overestimated; in two cases, underestimation occurs. For each of the latter four cases there are technical reasons to anticipate poor predictions of L : low R^2 's for

Figure 1. Predicted and actual curves for adoption of fair housing legislation, 1937-1965

merit system, fair employment, and AFDC; negative intercepts for merit system and AB; a large intercept for AFDC; large standard errors for merit system and AFDC. More error seems to occur when attempting to predict the processes which have diffused completely. A more substantive interpretation is that error in prediction occurs for welfare laws; an explanation

for this phenomenon will be offered in the section comparing issue areas.

The estimates of the parameter b in column 6 of Table 2 are also of interest; b can be interpreted as the probability that when "leaders" from two states meet, their interaction results in another adoption. Unfortunately, there is no criterion by which to evaluate the accuracy of

Figure 2. Adoption of degree requirement for teaching in high school by state, 1896-1966

Figure 3. Adoption of aid to families with dependent children legislation by state, 1911-1937

these probabilities.²³ Interaction has the greatest impact in the diffusion of old-age assistance legislation. The fact that most of the b 's are small is understandable, since for the graphs of most of these twelve laws a straight line with a "tail" at each end would fit. Therefore, a linear model was also evaluated, using the regression equation,

$$(7) A_t = bA_{t-1} + c + e,$$

where the symbols are those defined earlier.

The R^2 's of the quadratic model can be compared to the R 's of the linear model, using the F -statistic as the test for significant difference.²⁴ As shown in Table 3, for 6 of the 12 models there is a significant increase in the proportion of variance explained when the interaction term is added. Consequently, in half of the cases studied, innovations seem to diffuse through interaction.

Table 3. Comparison of Quadratic and Linear Models for Twelve Innovations

Laws	Quadratic R^2	Linear R^2	F
<i>Civil Rights</i>

* Significant at .05 level.

This simple interaction model holds up fairly well under evaluation on the basis of the crite-

²³ In general, the accuracy of b may depend upon the degree to which a social structure is completely intermixed. In this case, bias may be introduced by structural characteristics, such as regionalism, which reduce the number of relations across regional boundaries and increase the state contacts within regional communication networks. For an excellent discussion of communication networks at the state level see: Walker, "The Diffusion of Innovations Among the States," pp. 891-897.

²⁴ John Cohen, "Multiple Regression as a General Data-Analytic System," *Psychological Bulletin*, 70 (1968), 435.

ria used above. The results generally confirm that some of these innovations diffuse as do others—through the interaction of users and nonusers. The next section compares the results by issue area. Certainly, one might want to refine the model, perhaps by adding a term for constant source diffusion and by relaxing the assumption of a completely intermixed population.²⁵

Diffusion Patterns by Issue Area. Results from evaluating the diffusion interaction model can be put to a further use: comparing the three policy areas—education, welfare, and civil rights—with respect to diffusion from interaction. Several analyses of state expenditures, broken down by functional area, report that states vary in their level of support for each function, sometimes in response to the varied nature of the stimulus from federal grants-in-aid.²⁶

Table 2 contained several points at which the issue areas differ. The average R^2 for civil rights is .9637; for welfare, .9634; for education, .9956. Innovations in education appear to occur with more regularity, possibly because the process took place over a longer period than in the other issue areas. Furthermore, within the area of education, there is little variation in R^2 's among the various laws, while in the other two areas, there is marked variation in the amount of variance explained. Thus, one

²⁵ It should also be noted that several sources of error are possible in this model. First of all, the data are recorded as proportions based on 48 states; obviously, there were less than 48 states in existence for many years studied. Nevertheless, the model fits best for the longer processes (i.e., education) in which more states are absent; hence, this possible source of error did not have deleterious effect on the goodness of fit.

Another kind of error could arise from using a lagged dependent variable on the right-hand side of the regression equation; the assumption that the stochastic or disturbance term is normally and independently distributed may be violated in such a situation. A common test statistic for the presence of serial correlation (i.e., the disturbance at t is highly correlated with the disturbance at $t-1$) is the Durbin-Watson d . When proper adjustments are made for using a lagged dependent variable, the d -test indicates no serial correlation. (See Carl F. Christ, *Econometric Models and Methods* [New York: John Wiley & Sons, 1966], p. 522). Another test for normality is to collect the residuals into a frequency distribution and graph them. (See Christ, pp. 526-530). If the residuals are approximately normal, the graph will be bell-shaped. When this test was applied to three of the laws, the residuals did not appear by inspection to be normally distributed. Thus, the results of the two tests are conflicting concerning the error terms.

²⁶ See Virginia Hickman Gray, "Theories of Party Leader Strategy and Public Policies in the American States." (Doctoral dissertation, Washington University, 1972).

could say that education innovations diffuse in a regular and similar manner, for whatever reasons, whereas civil rights and welfare adoptions do not follow a single diffusion path unique to the subject matter of the law.

It is interesting to note from Table 3 that the interaction term makes a difference for 3 of 5 education laws, 3 of 4 welfare laws, and no civil rights laws. This tendency fits in with the other findings, all generally pointing to the conclusion that the normal diffusion of civil rights laws is met by resistance from particularly immune states.

Although the simple diffusion model does not allow for it, one might also differentiate patterns of adoption according to the amount of diffusion from a constant source relative to diffusion from interaction. For instance, one might hypothesize that program adoptions tied to federal grants-in-aid will diverge from the pattern of normality exhibited by programs adopted independently by states. For this reason, wherever possible, laws were chosen for this study from areas relatively untouched by the federal government. In the welfare area, programs were selected which began independently, though the last few observations (those after 1935) are of programs falling under federal aegis.

Walker in his landmark article does not anticipate much difference:

In a later work I will report the results of comparisons of the diffusion patterns of issues from different subject matter areas. Preliminary efforts at such comparisons, however, have not revealed significant variations. There does not seem to be much difference in the diffusion patterns of issues of different types.²⁷

Walker makes up his composite innovation score from 88 programs which represent a mixture of federal grant-in-aid and independent state programs. He includes five state programs which are used in this study: compulsory school attendance, fair housing, teacher certification at both levels, and superintendence of public instruction. Their graphs are displayed in Figures 4-7 and in Figure 2. In the welfare area he uses program adoptions under the Social Security Act. The course of their adoption over time is displayed in Figure 8. There is a large initial enactment, and then adoptions drop off rapidly. Their diffusion pattern is radically different from that in any graph previ-

²⁷ Walker, "Diffusion of Innovations Among the States," pp. 882, n. 9, or Jack L. Walker, "Innovation in State Politics," in *Politics in the American States*, 2nd ed.; ed. Herbert Jacob and Kenneth N. Vines (Boston: Little, Brown and Co., 1971), p. 591, n. 9.

Figure 4. Adoption of chief state school officer legislation by state, 1835-1912

ously shown in this study. It seems, therefore, that diffusion patterns vary, even in Walker's own data, owing, apparently, to federal intervention.

The hypothesis that federal involvement is a source of variation in adoption patterns is also

Figure 5. Adoption of compulsory school attendance legislation by state, 1850-1918

Figure 6. Adoption of fair housing legislation by state, 1937-1965

Figure 7. Adoption of degree requirement for teaching in elementary school by state, 1930-1969

borne out by the graph in Figure 9 for state merit systems covering welfare. Only nine states had such coverage before the Social Security Act was passed. After its passage 32 states decided to place their employees under a merit plan. Following the Social Security Board's successful fight to make merit plans a requirement, the remaining seven states followed suit. As a result, the pattern of spread for this innovation is somewhat different from that of other welfare policies. These results indicate the necessity for at least distinguishing

between state and state-federal control in this dimension of policy and perhaps distinguishing among various types of federal aid to states.

Sources of Innovativeness

The second consideration of this study is the question: Why do some states adopt before others? Walker hypothesizes that demographic (socioeconomic) and political factors are among the more important preconditions for innovation just as they are for expenditures; hence, his prediction is that the wealthier and

Figure 8. Adoption of Social Security programs by state, 1936-1955

Figure 9. Adoption of welfare merit system legislation by state, 1883-1942

more competitive states ought to be more innovative. He found a strong positive correlation between average income and his innovation score in three time periods and little relationship between party competition and the composite innovation score for 95 years, when controlling for the demographic variable.²⁸

The averaging of innovativeness, party competition, and income over nearly a hundred-year period may serve only to obscure whatever relationships exist between policy and the political system. This investigation of the reasons for innovation will be based on a less rigorous test of the above political and economic hypotheses. The question of interest is why a state adopts a law at a particular point in time. Part of the answer (to why states adopt at all) lies in user interaction, as demonstrated earlier in this article. User interaction, however, is not a full explanation because it cannot account for the first adoption. Political and economic explanations may be more relevant to the most and least innovative states (i.e., why the first is susceptible and why the last is most immune), while user interaction might better account for the order of the states falling in the middle range of innovativeness. Therefore, this part of the inquiry will focus on the political and economic differences between the first adopters and the rest of the states at the time of adoption. A similar kind of analysis could not be

performed for the laggard states because for several laws, diffusion is not yet complete.

Analysis of First Adopters. One might predict that the most innovative states (defined as the first ten states to adopt any particular law) would be above average in wealth and competitiveness in whatever year they adopted the law. The wealth measure used is per capita personal income which is available since 1922. The party competition measure is the governor's electoral margin in the most recent general election.²⁹ An appropriate test is to compare an early adopter's competition (or wealth) score in the year of adoption to the mean competition (or wealth) score for all 48 states in that particular year. The early adopter's score should be above the nationwide mean in each case.

There are 120 possible observations on which to make the test (12 laws times the top 10 states). Unfortunately, much of the pertinent data is missing from standard sources because the adoptions occurred very early for many of these laws. There are only sixteen observations for party competition. Of these, twelve (75 per cent) are in the predicted direction: competition is higher in innovative states. There are 40 observations for per capita personal income. Thirty-four (89 per cent) are in the predicted direction: innovative states are richer.

Thus, it appears that innovative states are both wealthier and more competitive than their sister states at the time of adoption of a particular law. This finding is consistent with the hypotheses derived from studies of state and local expenditures.³⁰ The small amount of data is not sufficient for testing the independence of the two variables. Also the available data were in the fields of education and civil rights only. The relationships discovered were more clear-cut for civil rights laws than for education laws. This finding, along with the fact that education laws diffused in a more regular pattern than civil rights, is evidence that education may be the least politicized of the three policy areas. The following section documents one case in which politics was particularly important.

The Case of Mothers' Aid Legislation. As noted earlier, the user interaction model failed to account for the unique diffusion pattern displayed by AFDC, or Mothers' Aid, as it was

²⁸ For more complete explanation of these measures and their data sources, see Gray, chap. 2.

²⁹ Richard E. Dawson and James A. Robinson, "Inter-Party Competition, Economic Variables and Welfare Policies in the American States," *Journal of Politics*, 25 (May, 1963), 265-289.

²⁸ Walker, "Diffusion of Innovations Among American States," 884, 886.

called at its inception. Also the distribution of adopters is unusual as was shown in Figure 3. For these reasons another explanation of the fact that eighteen states adopted such legislation in 1913, the second year of its diffusion should be sought.

The origin of the idea seems to have come from the "White House Conference on the Care of Dependent Children" called by President Theodore Roosevelt in 1909. The theme of that conference was that home care for dependent children is preferable to their being placed in institutions.³¹ The innovation was opposed by social workers;³² it was popular with legislators, however, because no increased taxes were anticipated.³³ Thus, the presidentially sponsored conference may have been indirectly responsible for the rapid dissemination of the information, though not for rapid adoption of the legislation.

Certainly the outstanding political feature of this era was the Progressive Movement, and it is reasonable to suppose that politicians of Progressive sympathies would support social welfare legislation. Dewitt, writing in 1915 on the Progressive Movement, said that the social phase of the movement was by far the most important at the state level and that Progressive reformers advocated mothers' pensions.³⁴ In fact, a history of Progressivism in Ohio gives credit for Ohio's mothers' pensions to James Cox, a Democratic governor with Progressive sympathies elected in 1912.³⁵

In order to test for Progressive influence on the time of adoption, the states were divided into two groups: the eighteen states which adopted in 1913, and the 28 states which adopted later and for which data are available. For each group of states the mean percentage of Progressive party strength was computed, based on the elections for the governorship and the legislature immediately prior to 1913. This figure should underestimate the strength of Progressivism since politicians running on the regular party ticket also may have had Progressive sympathies.

³¹ Fred S. Hall, ed., *Social Work Yearbook, 1929* (New York: Russell Sage Foundation, 1930), pp. 131, 274.

³³ Ada J. Davis, "The Evolution of the Institution of Mothers' Pensions in the United States," *American Journal of Sociology*, 35 (January, 1930), 582.

³⁴ Benjamin Parke DeWitt, *The Progressive Movement* (New York: Macmillan Co., 1915), p. 253.

³⁵ Hoyt Landon Warner, *Progressivism in Ohio, 1897-1917* (Columbus: Ohio State University Press, 1964), p. 404.

The means for each group are displayed in Table 4. States which adopted mothers' aid legislation in 1913 averaged much greater Progressive strength than did states adopting later. Apparently, this is one case where politics played an important part in the timing of an innovation. In the following section the investigation focuses on patterns of innovation.

Patterns of Innovation. Throughout this study each innovation has been studied separately, in contrast to the method used by Walker. The previous sections have demonstrated the utility of disaggregation. Indeed, one might question the fundamental assumption of a "composite innovation score"—namely, that "innovativeness" exists as a single factor among states. Operationally, the question becomes "Do the states which are early to adopt one law also adopt other laws first as well?"

Table 5 shows how states rank in each of the three issue areas, and how they rank overall. The states were ranked from 1 (first) to 48 (last) on time of adoption of each law. Then a state average was computed for each issue area and overall. The overall ranking is similar to Walker's, partly because five of the laws included here were the same as his. There are some notable differences, however; Pennsylvania is 20th on this scale and 7th on Walker's; Nevada is 21st on this scale and 47th on Walker's; Louisiana ranks 19 on his scale and 36.5 here.

The interesting information that is concealed by a simple average ranking is the range for any one state. New York and California are the most innovative states; yet each has failed to adopt one of the laws in question. South Dakota is the most laggard state; nevertheless, it was among the first ten for one law. Thus, any study of policy innovation using averages

Table 4. Extent of Progressive Influence in States, According to Time of Adoption of Mothers' Aid Legislation

	Mean % Progressive Party Strength in Last Election Before 1913	
	Timing of Adoption	
Electoral Contest	1913 Adopters	Later Adopters
Governor	15.2%	6.5%
Lower House	7.0	.5
Upper House	6.0	1.2

across issue areas may conceal phenomena of great potential interest.

Table 5. Ranks of the States According to Order of Adoption of Laws, Averaged by Issue Area

State	Overall Average Rank	Average Education Rank	Average Welfare Rank	Average Civil Rights Rank
California	13.0	6.1	11.5	26.5
New York	13.0	19.2	12.5	3.3
Massachusetts	14.8	25.0	8.7	6.0
New Jersey	16.0	24.9	13.3	4.8
Wisconsin	16.2	27.7	5.0	12.3
Connecticut	16.2	16.4	24.3	5.1
Washington	16.4	18.0	17.7	11.8
Colorado	16.8	26.3	9.3	11.1
Michigan	16.8	16.0	20.3	13.6
Illinois	17.2	25.0	10.1	13.6
Ohio	17.2	25.7	10.3	15.6
Idaho	19.0	23.6	12.1	20.5
Oregon	19.0	20.9	23.7	9.6
New Hampshire	19.9	22.4	16.3	20.5
Maryland	20.0	15.5	15.7	33.5
Indiana	20.4	16.1	33.5	10.1
Kansas	21.4	14.2	29.5	22.6
Utah	21.5	17.6	22.2	40.3
Minnesota	22.1	39.1	11.3	8.1
Pennsylvania	22.9	27.1	25.5	12.6
Nevada	23.5	24.0	10.5	40.3
Wyoming	25.3	27.6	21.7	39.8
Montana	25.5	29.7	25.7	18.1
Rhode Island	25.5	28.1	35.7	7.8
Kentucky	25.7	21.3	23.8	35.6
Vermont	25.9	18.1	29.2	37.8
Missouri	26.6	21.7	28.3	32.6
Arizona	27.2	22.8	27.6	34.1
Iowa	27.5	30.0	16.8	37.8
Delaware	27.8	25.6	28.1	31.1
Nebraska	28.2	35.7	18.8	28.3
Maine	29.6	34.4	18.8	36.0
New Mexico	29.7	25.2	38.3	26.0
North Carolina	30.2	17.5	42.7	48.0
West Virginia	30.9	25.4	25.1	48.0
Louisiana	31.7	21.1	32.8	48.0
Texas	31.7	23.0	41.1	48.0
Tennessee	31.9	23.2	30.7	48.0
South Carolina	34.3	24.4	36.5	48.0
Arkansas	35.0	30.9	30.3	48.0
Florida	35.0	28.4	33.5	48.0
North Dakota	35.4	38.1	28.7	39.8
Virginia	36.0	25.5	40.2	48.0
Oklahoma	37.1	36.2	30.1	48.0
Alabama	37.1	28.2	35.3	48.0
Mississippi	37.4	32.0	36.3	48.0
Georgia	37.7	31.0	38.5	48.0
South Dakota	38.4	37.9	32.0	48.0

Spearman rank-order correlations can be utilized to answer more directly the question of the stability of "innovativeness." If there exists a stable factor of "innovativeness," then states ranking high (or low) on a scale of time of adopting any one law ought to rank high (or low) on a time of adoption scale for another law. Certainly, within an issue area this principle ought to hold; i.e., the correlation between one education ranking scale and another education ranking scale should be positive. States were ranked from 1 (first) to 48 (last) on each of the twelve laws according to time of adoption.

Table 6 presents the correlation of the rank on one innovation scale with the rank on every other innovation scale. In general, the strength of the correlations is very low. Only eleven of 66 ($\frac{1}{6}$) are .50 or above; sixteen (about 25 per cent) are negative. About half of the stronger correlations are between laws which diffused during roughly the same time period. One might infer that some states are innovative at one point in time, but they are not necessarily innovative at another point in time; hence, "innovativeness" should not be aggregated over long time periods.

If "innovativeness" does not occur as a general timeless phenomenon, perhaps it is issue-specific, i.e., the same states might be innovative in all phases of education but not innovative on other issues. Table 7 shows that only for the issue of civil rights does the phenomenon of "innovativeness" truly appear to exist: the average of states' rank intercorrelations on civil rights laws is .67. States which are leaders (or laggards) in adopting one civil rights law are leaders (or laggards) on other civil rights laws. This finding, juxtaposed with those earlier concerning the civil rights distribution's stronger association with wealth and competition, is further evidence that civil rights laws are more politicized than are the laws in the other two policy areas.

Contrast this with the situation in the education field where not only is the adoption of education laws unrelated to adoption of laws in welfare and civil rights, but adoption of one education law is only slightly related to adoption of another education law; the average rank correlation among education laws is .17. Probably the length of time is one explanation, e.g., adoptions of one education law extend over the period 1784-1969. Also the five education laws are probably more diverse in substance than the set of three civil rights laws which evoke more powerful public reactions.

Another reason for the high intercorrelation among civil rights laws is that they diffused later in a shorter time period; many states have not yet adopted them. Technically, this means that there are a larger number of ties on the civil rights rankings; therefore, a correction was made for ties which has the effect generally of reducing the strength of the correlation, though the magnitude of the reduction was slight for these three laws.³⁶ At any rate, the civil rights rankings reported here are corrected for ties

	Education	Welfare	Civil Rights
Education	.17	.07	.15
Welfare		.41	.44
Civil Rights			.67

Summary

Innovations (adoption of laws by states) were studied in three "have-not" oriented policy areas: education, welfare, and civil rights. A model of the diffusion process based on user interaction was constructed; it performed fairly well under evaluation by several common criteria. Graphical analysis showed, however, that diffusion patterns do differ by issue area and by degree of federal involvement.

Political and economic explanations proved to be useful in determining which states are the first to adopt laws. A brief case history of the adoption of Mothers' Aid legislation pointed up the strong effect of Progressive sympathies on early adopters. Finally, it was shown that "innovativeness" is not a pervasive factor; rather, it is issue-and time-specific at best.

Comment: Problems in Research on the Diffusion of Policy Innovations*

JACK L. WALKER

University of Michigan

Diffusion theory has been an important tool for analysis by geographers, sociologists and economists, but the diffusion of diffusion theory among political scientists, so far, definitely does not approximate an S-shaped curve! In fact, as far as I know, Professor Gray's is only the second article in *The Review* that employs the word "diffusion" in its title.¹

The obstacles to the spread of diffusion theory among political scientists do not exist in the essential nature of political phenomena. The American federal system can usefully be conceived as an elaborate diffusion process, as Gray's article demonstrates, and many other cases where distinctive approaches to policy have evolved within some part of the governmental system might better be understood if seen as examples of diffusion. The reasons for political scientists' neglect of diffusion theory, of course, lie not in the peculiarities of their subject matter, but in the prevailing division of labor among scholarly disciplines in American universities. The various branches of learning stake out their special preserves and claim exclusive jurisdiction over certain variables, research problems, and explanatory theories—diffusion processes have been centrally important for anthropologists but have rarely been employed by students of politics.

There is no good intellectual justification for restricting the use of any explanatory scheme to a limited class of social problems. All the social sciences need as much theoretical help as they can get. Certainly, Gray's article, with its references to material from several disciplines, is a model of the ecumenical spirit and a good example of the progress that can be made through judicious borrowing from other scholarly traditions.

Professor Gray set out in her article to "extend in a more rigorous fashion the investiga-

tion of innovation by states"² that I began four years ago. It would be unduly coy of me not to express satisfaction at this evidence that another political scientist found my work stimulating enough to use it as a guide for further investigation. The mathematical model that is the centerpiece of this article should be useful for analyzing data in several other settings and should stimulate further interest in diffusion theory within our discipline. It is important to see, however, that Gray has not only employed different techniques of analysis than I did, but has also studied a somewhat different aspect of the diffusion process, and has structured the problem in a different way. These crucial variations in our approaches seem to have led to some misunderstanding between us about the use of terms, and they may account for some of the apparent differences in our findings.

Our two articles attack the same general problem, using similar data, but with contrasting assumptions and ultimate aims. Our findings differ in some important ways, but because this is still a largely unexplored area, the most significant aspect of the two presentations is the kind of guidance they offer for future research. In this comment, besides defending my own approach which I believe takes us in more fruitful directions, I shall attempt to provide insights into the principal conceptual and methodological problems that face anyone wishing to investigate the diffusion of public policies among the American states, or among nations or other governmental units. The comment begins with a brief résumé of my own article, and proceeds with an analysis of the way Gray and I have answered some of the more serious questions of measurement and inference that arise in this field.

Curves Versus Spreading Ink Blots

The central problem I dealt with involved

* Thanks are due to James Alt of the University of Essex, Sidney Winter, my colleague at the Institute of Public Policy Studies at the University of Michigan, and my wife, Linda G. Walker, who read an earlier draft of this comment. Their criticisms and suggestions saved me from many mistakes of inference and expression, but what finally emerged is entirely my responsibility.

¹ See Kenneth Janda, ed., *Cumulative Index to the American Political Science Review* (Evanston, Ill.: Northwestern University Press, 1964).

² Virginia Gray, "Innovation in the States: A Diffusion Study," *American Political Science Review*, 67 (December, 1973), pp. 1174-1185. The article to which she refers is: Jack L. Walker, "The Diffusion of Innovations Among the American States," *American Political Science Review*, 63 (September, 1969), 880-899. A revised version of this article appeared in: Herbert Jacob and Kenneth N. Vines, eds., *Politics in the American States*, 2nd edition (Boston: Little, Brown and Co., 1971), pp. 354-387.

the relative speed with which states adopted new ideas. I was interested in whether some states characteristically adopted new programs earlier than other states and if so, how this phenomenon might be explained. I began my research by developing a measure of the average speed of adoption for all the states and then tried to discover its economic, social and political correlates. Gray questions the validity of this index of innovativeness because she doubts that states remain peculiarly innovative over a long period of time or that a quality called "innovativeness" could ever be isolated and independently described. I disagree with her over this question, but more about that below. The important point I wish to make at the outset is that I was primarily concerned with the propensities of states to adopt new programs and attempted to create an empirical index of this characteristic, averaged over many possible adoptions. I was not concerned, as is Gray, with the cumulative frequencies of adoptions over time or whether the pattern of adoptions approximated an "S"-shaped curve.

I did refer in my article to "patterns" of adoption, but did not use the term to refer to cumulative frequencies. I advanced the hypothesis that a typical diffusion pattern existed in which one of the pioneering states adopted first, followed by other pioneers, and finally by other states which tended to take cues from their regional pioneers. This diffusion process forms an essentially geographical pattern, and can be visualized as a succession of spreading ink-blots on a map created by the initial adoptions of new policies by states playing in a national "league" of cue-taking and information exchange, followed by other states whose standards of comparison and measures of aspiration are more parochial and who typically adopt new policies only after others within their regional "league" have done so.

In view of these differences in our use of the phrase "pattern of adoption" I believe Gray is unfair in charging that I did not see differences between the patterns of adoption of innovations that arose from state initiative and those that were launched at the federal level or were subject to federal intervention at some point in the course of their diffusion.³ As I gain experience in research and the distractions of university life I can see that it is a mistake ever to promise further work on a problem, even if one honestly expects to do it, but I did spend some time with the question of federal intervention and found, as I reported, little difference in the rank ordering of states on such issues, or in the es-

entially geographical patterns I was looking for.

Gray's analysis of the shape of diffusion curves clearly leads to the presumption that federal intervention makes a difference in the temporal frequencies of adoption, generally by accelerating the process and encouraging the spread of innovations to all the states. This is an important finding that might eventually allow the classification of issues according to differences in their diffusion patterns. Of course, programs that diffuse to the great majority of states within only three or four years, such as Aid to the Blind or Old Age Assistance, even if they constitute an analytically separate class of issues within some broader theory of diffusion, nevertheless are difficult to study because of their speed of diffusion. Before this aspect of Gray's inquiry can be exploited, a wider selection of programs affected by federal intervention must be analyzed, but this line of research appears to offer many interesting possibilities. It should be understood, however, that Gray and I were interested in different kinds of diffusion patterns, each important in their own right. Even though our data were similar, our discoveries were different because we were asking different questions, as well as using different methods.

Regional Barriers to Interaction

This apparent misunderstanding between us over the meaning of the phrase "diffusion patterns" helps to reveal the differences in our projects and to show how much explanatory power Gray has had to give away in order to achieve the kind of rigor that characterizes her presentation. One central assumption upon which her diffusion model is founded is that all states may be treated alike for the purposes of analysis, or to use her terminology, she assumes that she is working with "a completely intermixed population."⁴ My research specifically was designed to show that the American states are *not* a completely intermixed population, but rather are organized into a complex system of pioneers, regional leaders and laggards. I identified some important developments that were creating pressures for national uniformity, such as the growing cosmopolitan communities of public officials and policy experts, and made some rather oblique efforts to measure these trends, but my conclusion was that regional differences were remarkably persistent and unlikely soon to disappear. Gray certainly recognizes that regional biases in the flow of communications among adopters may make it unreasonable to

³ Gray, p. 1185.

⁴ Gray, p. 1176, 1179.

regard the states as a completely intermixed population and refers several times to the possibility of creating more elaborate models of diffusion by relaxing this fundamental assumption,⁵ but presumably this would be a much more difficult undertaking that would not have the economy or simplicity of her present model. These remarks are not meant to deny the obvious benefits of creating formal models, but merely to underline the limitations of this one as a description of reality.

This questionable basic assumption hinders Gray in explaining the diffusion of civil rights bills, for which she reports that the "normal" diffusion process, based on the interaction among decision makers, "is met by resistance from particularly immune states."⁶ These fourteen resistant states, of course, with one exception (South Dakota), are contiguous and clustered in the South.⁷ It might be an interesting test of Gray's model if she removed the thirteen southern states, or perhaps only the eleven states of the Confederacy usually designated as southern in such studies, and ran the model for the remainder, among which the assumption of complete population intermixture might be more legitimate. If this exercise were performed on the states outside the South, the interaction term in her diffusion model might begin to assume the importance it does for most cases in education and welfare.

Regional peculiarities that produce "interaction effects"⁸ in her data also call into question Gray's assertion that civil rights legislation is more likely to be caught up in partisan disputes than are topics such as teacher certification or AFDC. This inference grows from several findings, including the fact that rank orderings of the states according to the speed of adoption of civil rights bills have stronger associations with measures of relative wealth or political competition than rank orderings based on legislation in the other two categories. These high correlations, however, may result only from the tight clustering of southern states at the bottom of all these scales, a fact that may have arisen merely by coincidence. Findings of this kind may be only a reflection of the great differences between the South and the rest of the country

and may not be an indication of functional relationships among these variables within all the states. If states in the South and those in the rest of the country were treated as independent groups the relationships between the speed of civil rights adoption and wealth or political competition may disappear within each group. In research of this kind, where such distinctive regional clustering appears, correlations should be run with the distinctive region removed before generalizations or further broad inferences are made about functional relationships or causative factors.⁹ A more elaborate model that takes account of regional barriers to interaction among potential adopters would still be needed, even if such tests were made, but these extra pieces of analysis might prevent Gray from drawing misleading conclusions from findings that may only be statistical artifacts.

Differences Between Issues and Adopters

The differences in the fundamental assumptions Gray and I make concerning the nature of the system we are investigating have helped to determine our choices of research strategies as well as the course of our analyses. Gray, for example, argues that each policy innovation should be studied separately so that the peculiarities in each diffusion pattern can be discovered and accounted for. She doubts the usefulness or validity of my efforts to create a composite index of innovation because she does not believe that any quality called "innovativeness" can be attached to any single state government for any significantly long period of time.¹⁰ Her assumption of the interchangeability of states, of course, is consistent with the careful analysis of individual issues. By testing each distribution of cumulative frequencies of adoption against the prediction that it will approximate normality Gray has an unchanging standard for comparison. Using this method her attention usually is directed to the peculiarities of the issues under examination that cause them to diffuse in an "abnormal" way—whether they are presented for adoption with accompanying federal grants-in-aid, for example, or stimulate unusual amounts of partisan controversy. This research strategy is akin to those used in studies of the diffusion of technological artifacts to farmers or small businesses where assumptions about

⁵ Gray, pp. 1176, 1179, and footnotes number 21, 23 and 25.

⁶ Gray, p. 1180.

⁷ These data are provided by Gray in Table 5, p. 1184.

⁸ The phrase "interaction effects" is being used as it was in: Hugh Donald Forbes and Edward R. Tufte, "A Note of Caution in Causal Modelling," *American Political Science Review*, 62 (December, 1968), 1261-1262. For similar commentary see the discussions of the "universal fallacy" and the "contextual fallacy" in Hayward R. Alker, Jr., *Mathematics and Politics* (New York: Macmillan, 1965); pp. 101-106.

⁹ For a more lengthy presentation of this view, see: Dennis Riley and Jack L. Walker, "Communication," *American Political Science Review*, 63 (September, 1969), 900-903. For an interesting discussion of analytical problems created by regionalism, see: John L. Sullivan, "Political Correlates of Social, Economic, and Religious Diversity in the American States," *The Journal of Politics* (February, 1973), pp. 70-84.

¹⁰ Gray, pp. 1183-1185.

the complete intermixture of the populations are appropriate, or at least not so risky as in the case of a vast, continentwide governmental system.¹¹ Gray's method has yielded several important insights, as the case study approach often does, and my own work probably suffered from inadequate sensitivity to the importance of the characteristics of policy innovations as determinants of the course of their diffusion. Nevertheless, as long as Gray takes up issues one at a time and concentrates her attention on the nature of the objects being diffused she is unlikely to discover systematic or recurring differences in the responses of individual state governments to the prospects of change—the problem that was my special concern.

In my own research, the composite innovation score played the same role that Gray's assumptions about normal distributions play in hers. That is, it provided a framework for analysis and a basis for comparison. My efforts were directed at explaining why some states, on the average, adopted new ideas more rapidly than others—why New York tended to adopt most new policies before Mississippi—and in this inquiry I drew most often on insights from theories that emphasize the importance of structural and procedural differences among organizations or business firms in the way they process information, search for new ideas, or measure their achievements.¹² My attention was focused on the agencies adopting the innovations and on those stable aspects of their environment—especially regionalism and the growing professionalization of public bureaucracies—that seemed to be shaping their behavior. Gray touches on most of these factors in her presentation, but her approach leads her to focus most of her attention on the traits of the innovations being diffused, a mode of analysis that is unlikely to uncover fundamental differences among the adopters. My concern was primarily with the decision rules being employed by those to whom proposals for change were

being presented, and not so much with the importance of differences among the policy innovations themselves.

No researcher in this area will ever be presented with a simple choice between studying the nature of the innovations or the behavior of the adopters. Policy innovation and diffusion are much too complicated to allow anyone to ignore one side of the process altogether, although, as I have tried to show, most research designs place greater emphasis on one of the two aspects of the problem. This central analytical distinction is important, however, since it has significant consequences both for research design and for the formulation of generalizations and new hypotheses. Since limited resources usually require that attention be restricted to a small number of problems, most researchers must choose one emphasis over another, but decisions about these problems of research design are more than mere matters of taste. Even after reading Gray's paper, I still believe that efforts to develop a theory of organizational innovativeness and to create a better description of the specialized intergovernmental communication links within the American federal system offer greater potential theoretical payoffs. It is very likely that "innovativeness" is an impermanent condition, and that periods of pioneering innovation by a state government often are followed by periods of consolidation, or even stagnation, but this presents us with the challenging task of explaining these cycles of change. Even though Mississippi was the least innovative state on my composite index, it was the first to adopt the sales tax and recently has pioneered in allowing conjugal overnight visits for prisoners in its jails and penitentiaries.¹³ This may indicate, as Gray's analysis suggests, that within certain classes of issues, innovations may originate on the periphery rather than in one of the system's cosmopolitan centers.¹⁴

We probably can never hope to account for more than a modest amount of the variance, however, in so immense and elaborate a system. The presence of a single aide on a legislative staff who is enthusiastic about a new program, or the chance reading of an article by a political leader can cause states to adopt new

¹¹ For a review of diffusion research that includes an extensive bibliography of more than 1,500 items see: Everett M. Rogers and F. Floyd Shoemaker, *Communication of Innovations: A Cross-Cultural Approach* (New York: Free Press, 1971).

¹² The body of theory upon which I drew is summarized best in Donald W. Taylor, "Decision Making and Problem Solving" in *Handbook of Organizations*, ed. James G. March (Chicago: Rand McNally, 1965), pp. 48–86. Also see: Julia Feldman and Herschel E. Kanter, "Organizational Decision Making," *Ibid.*, pp. 614–649; W. Richard Scott, "Theory of Organizations" in *Handbook of Modern Sociology*, ed. Robert E. L. Faris (Chicago: Rand McNally, 1964), pp. 485–529; and Lawrence B. Mohr, "Determinants of Innovation in Organizations," *American Political Science Review*, 63 (January, 1969), 111–126.

¹³ For a discussion of the genesis of the latter program and reactions to it in other parts of the country, see: Columbus B. Hopper, *Sex in Prison: The Mississippi Experiment with Conjugal Visiting* (Baton Rouge: The Louisiana State University Press, 1971).

¹⁴ For an insightful article that illustrates this point in reference to innovations in public health, see: Marshall H. Becker, "Sociometric Location and Innovativeness: Reformulation and Extension of the Diffusion Model," *American Sociological Review* (April, 1970), pp. 267–282.

programs more rapidly than might normally be expected. We are studying an immensely complicated social system in which random occurrences and chance factors are prominent ingredients, but regardless of these difficulties I am not prepared as yet to give up my emphasis on organizational factors as keys to understanding. nor am I able to accept Gray's alternative notion that New York can be regarded as interchangeable with Mississippi or Arkansas, or that California can be placed, for purposes of analysis, in the same class as Wyoming, Vermont, or Rhode Island.

Innovation Scores and Sampling

Gray's demonstration that the twelve issues she dealt with were not strongly intercorrelated is not sufficient grounds for abandoning efforts at measuring the factor of innovativeness in state governments. She chose programs that were relatively free of federal influence and were objects of the struggle between haves and have-nots, because she wanted to evaluate the importance of political, rather than economic factors, that exist within the states rather than at the national level, as determinants of diffusion. Also, the issues she studied came from only three issue areas, compared with twelve in my study. Yet even though different criteria of selection were used in our two studies, the composite score Gray produced still roughly approximates the one I presented. Gray is certainly justified in claiming that a composite score may cover up interesting phenomena, and her article gives evidence of the insights that can be gained from disaggregation. Some merging of our techniques probably will be necessary to produce a full picture of this complicated diffusion process, but where the composite innovation score is concerned, my hunch is that most new scores based on a relatively broad selection of issues using almost any issue typology as guidance would very closely resemble the one that emerged from my data.

Admittedly, this is little more than an assertion of faith, but it cannot be given a conclusive empirical test until a method can be devised for selecting a representative sample of bills from whatever issue areas or policy arenas one chooses to study. Neither Gray nor I have dealt adequately in our research with the problem of sampling. Hundreds of thousands of programs have diffused through the federal system during the past fifty years alone and we have no satisfactory way of cataloguing or listing them as a basis for sampling. Although each of us has constructed criteria for issue selection that seem reasonable, we have no guarantee that the issues we are studying are not

highly unusual and somehow unrepresentative of their class. This problem is not serious enough, in my opinion, to halt inquiries into diffusion, but until more reliable sampling techniques are devised we must use caution in evaluating descriptive statements of any kind arising from anyone's research.

Reasons for Studying Organizational Innovativeness

Naturally, it would be possible to design a study that concentrated on the traits of the issues being diffused without also making the assumption that the American states can be treated as a completely intermixed population. I believe this assumption is a serious weakness in Gray's approach, as should be plain by now, but I do not want to make too much of it. There are other serious obstacles to building theories of diffusion that employ traits of the innovations as factors determining their diffusion patterns, and principal among these is the fact that the proposals themselves often are constantly being modified during the course of the diffusion process.¹⁵ Can we safely make the assumption that the legislation providing Aid to Families with Dependent Children in the 1930s or 1960s is actually just another name for the Mother's Aid Legislation of the Progressive era? Is it not likely that these proposals have been so thoroughly modified that they are actually different bills and should be treated separately rather than as integral parts of a continuous process of diffusion? Without doing the necessary investigation, I cannot answer these questions, or similar ones that arise about the diffusion of state boards of education that took place over a period of 165 years. It will not be easy, however, to construct an objective method of deciding when an alteration in the details of a program is only a modification of the original or a change of such magnitude that it constitutes an innovation in itself worthy of independent analysis. This problem plagues all diffusion research that deals with phenomena as complex as social programs, and in principle it is not insurmountable, but until it is dealt with, the researcher who concentrates on studying the shape of diffusion curves cannot be sure whether the process being observed is a discrete event or whether it represents the aggregation of two or more independent diffusion processes.

Beyond these serious conceptual problems

¹⁵ For a more extensive discussion of this problem see: Kenneth E. Warner, "The Need for Some Innovative Concepts of Innovation: An Agenda for Research" (Working Paper Prepared for Faculty Seminar on Innovation and Social Change, Institute of Public Policy Studies, University of Michigan, 1972).

facing alternative approaches there also are positive reasons for innovation researchers to concentrate on such questions as the information sources utilized by decision makers, the prevailing decision rules being used by potential adopters, and the determinants of organizational goals or aspirations. It seems more likely that work on this cluster of problems will help us explain the first adoption of new programs by pioneering states before they begin to diffuse throughout the federal system. There have been few systematic attempts by students of diffusion to deal with this important aspect of the problem, just as political scientists have made little effort to discover the origins of public policies. With the notable exception of the dispute over "nonissues"¹⁶ and some mainly speculative discussion of political culture,¹⁷ political scientists generally have taken the issues that appear on the political agenda as given and have defined their task as the study of conflict resolution and the clash of vested interests, mainly in the electoral and legislative systems, that result from efforts to implement these proposals. The question of how issues evolve and present themselves for adoption has been given little attention.¹⁸ One cannot study everything at once, unfortunately, and few of the problems of diffusion have been laid to rest, but if our theories of the way policies spread through the federal system are built from studies of decision making, cue taking, and the flow of information between organizations, they are more likely than explanations built from an inspection of diffusion curves to merge with theories of how problems are identified and new proposals created in the first place. The processes of innovation and diffusion go together, and so should theories that are meant to explain them.

A Plea for More Research

Before setting out to investigate the diffusion of public policies among the American states, one must make several important decisions about the strategy and tactics of research. In this comment I have touched on some of the most important problems that arise at the earliest stages of research design, such as what fundamental assumptions about the nature of the federal system can legitimately be made, what kinds of findings can be taken as acceptable confirmation of central hypotheses, upon what bases issues should be selected or samples constructed, whether to focus mainly on the policies being diffused or to pay more attention to the adopting units—or how to merge these two concerns—and finally, what further theoretical problems or empirical questions can be attacked once the study being planned has been completed. All these questions would have to be dealt with, although in slightly different form, if one were to study the international diffusion of innovations¹⁹ or the spread of new policies among cities or counties.

I hope this brief commentary on Gray's article provides realistic illustrations of how these questions affect research on diffusion and how the two of us differ in our approach to the subject. Although both approaches offer promise of opening up a previously uncharted region for more intensive scholarly exploration, our techniques differ and so do our answers to some of the fundamental conceptual problems in the field. All scholars are inflicted with the imperialistic notion that their field of interest deserves much greater recognition and attention from their colleagues. It is an academic commonplace to call for more research on almost any problem. In the case of the innovation and diffusion of public policies, however, more research, recognition, and interest actually are needed, so I do not feel reluctant to make such a plea. Neither Gray nor I have exhausted the possibilities for significant investigations in this area. It is my hope that Gray's article and this dialogue between us over the problems and challenges of research on diffusion and innovation will attract many more political scientists into this important field.

¹⁹ For a study of the international diffusion of social security programs see: David Collier and Richard E. Messick, "Functional Prerequisites Versus Diffusion: Testing Alternative Explanations of Social Security Adoption," (Paper Delivered at the 1973 Annual Meeting of the Midwest Political Science Association, Chicago, Illinois).

Rejoinder to "Comment" by Jack L. Walker

VIRGINIA GRAY

University of Minnesota

I enter the final round of this dialogue with the same scholarly intent Professor Walker has so ably expressed—to wrestle with the problems and challenges of research on diffusion of innovations in the hope of attracting attention to this relatively unexplored realm of policy research.¹ Perhaps we should be worrying about a more practical problem of diffusion: in Rogers and Shoemaker's review of the literature, including a bibliography of 1500 studies of innovation, political science is not recognized as having a tradition of research in this field.² Yet, both of our studies refer to this vast body of research in the other social sciences; mine in particular relies heavily upon previous theoretical work, resulting in some differences in the approaches of Walker and myself and thus sometimes in our different conclusions. Professor Walker has done an excellent job of summarizing those differences so I will confine myself to discussing first a few technical points in which we remain in disagreement; second, a more fundamental difference we apparently have on the usefulness of models in social science; third, the direction of future research.

Technical Points of Disagreement

As Professor Walker makes clear, his "patterns of adoption" refer to geographical patterns while mine refer to the tendency of the distribution of adoptions over time to approach a normal curve. His footnote in the original article asserting that there is little difference in the diffusion patterns of issues of different types appears in Section I, "Definitions and Distinctions," following an introduction where a long footnote discusses the theory of diffusion used in other fields.³ It is not until Section V that he develops his argument about the emulation of pioneer states and cue taking from neighboring states. So I believe my interpretation to be a

reasonable firsthand one, but I stand corrected. Walker says this diffusion process "can be visualized as a succession of spreading ink-blots on a map."⁴ I recall trying a rough approximation of this technique—coloring a map for each of twelve laws—and found no discernible regional variation for time of adoption among my data.

One disagreement I have is with Walker's suggestion at several points that one should remove the South for purposes of testing the model. This line of thinking is offered all too frequently in the state politics literature; to throw out the deviant, and hence the interesting, cases really begs the question of explanation. In one exercise Walker suggests this procedure because he believes the removal of the southern states would make the random mixing assumption more realistic.⁵ However, the problem he finds does not stem from this "unrealistic" assumption of the model but from the fact that the civil rights laws have not yet completely diffused, and thus the data for adequate validation are not at hand.

In the second exercise where Walker suggests this procedure he fails to understand my section "Analysis of First Adopters."⁶ In this section I found that the first ten states to adopt any particular law were usually more politically competitive and wealthier than the nationwide average in the year of adoption. It is important to note that after ranking and scoring the states according to time of adoption, with many southern states falling at the bottom of the scale, I analyzed only the first ten states to adopt; these, usually, were not southern states. Hence, my finding is not a "statistical artifact" resulting from a failure to treat the South as a separate group; my analysis does not rest at all upon those cases.⁷ But as a matter of idle speculation, just how would one go about rank ordering states on relative time of adoption to obtain an ordinal score for the purpose of further statistical analysis and at the same time leave out a quarter of the states making up the ranking for this particular political system?

One final technical point of misunderstanding between Walker and myself concerns my

use of rank-order correlations to get at the underlying structure of "innovativeness." I agree with him that my finding of little interrelatedness among twelve issues does not imply that we abandon research on "innovativeness." But my findings do constitute, I think, a caveat that one ought not to assume, a priori, that "innovativeness" is a stable factor; rather, one must establish the existence of "innovativeness" before he seeks to explain it. Walker does not sufficiently validate his innovation scale before he uses it.

Fundamental Disagreements

Our disagreement here is rather like that over a half-glass of water, whether it is half full or half empty. Walker asserts that because of my fundamental assumption that the population is completely intermixed I have had to give away much explanatory power.⁸ On the contrary, I think I have bought much explanatory power by beginning with one simple model based upon one "unrealistic" assumption. As Milton Friedman says, "the relevant question to ask about the 'assumptions' of a theory is not whether they are descriptively 'realistic,' for they never are, but whether they are sufficiently good approximations for the purpose at hand."⁹

Many other diffusion theorists have considered this assumption, unrealistic though it may be, to be sufficient at first. Both Bartholomew's birth process model for the diffusion of news and rumor and Coleman's social structure model begin with this assumption and then go on to more complex and more realistic theoretic models by relaxing this assumption.¹⁰ However, these more complex models quickly become intractable when their empirical validation is attempted. For this reason I retained my simple model; certainly the assumption does not make New York interchangeable with Mississippi; rather it represents formally a single theory which attempts to explain both states' innovations.

Furthermore, Walker fails to understand that the theoretic assumption of a completely intermixed population (for the sake of simplicity of the model) is not wedded to whether the distri-

butions of adoptions over time are normal. As I mentioned, many other theories can be constructed to fit this curve and their formal representation in a mathematical model may be simple or quite complex, e.g., allowing for constant source diffusion, within-group but not between-group interaction, and disadoption.

I elected to leave the model in its simple state and to work in the direction pointed out by failures of the empirical model to yield accurate predictions—toward developing a political explanation for Mothers' Aid, for example. When one uses this method, beginning with individual issues and not their aggregations, which is far from a "case study approach" as Walker calls it, the likelihood is greater, I think, for the emergence of patterns among states, issue areas, and other phenomena of interest to political scientists than when one begins his study by aggregation.¹¹

Direction of Future Research

I agree entirely with Walker that research is needed both on the macro level (the nature of the diffusion process of innovations) and on the micro level (the behavior of adopters as political actors). Also it is critical to establish the bounds of the universe to which our findings are generalizeable. A related problem is that of clarifying the operational definition of an innovation. I have relied on the data source in each case which reports, usually in a single table, when states adopted some law. Over time, however, as the language begins to diverge (as in the old game of "Gossip") the last adopter might not be really innovating in exactly the same manner as the first adopters. One could, of course, compare the language of the two bills from the states' legal codes, not an insurmountable task unless the number of innovations being studied is large.

Finally, I agree with Walker that a theory such as mine based on user interaction obviously cannot account for the first adopter; similar theories, however, have been applied in varying degrees of rigor with success to a range of social phenomena. This is usually taken to be an indicator of the generality of a theory—it can explain what seems to be a wide variety of behaviors. Another virtue of a good theory is that it is consonant with, or can subsume, other theories within the same paradigm. Thus, I, in contrast to Walker, can see no intellectual reason why a theory of diffusion which is parsimonious, powerful (in its predictive ability here), and general cannot merge with appropriate theories of the origin of innovations in a social system.

Economic Growth and Intergenerational Change in Japan

NOBUTAKA IKE

Stanford University

Introduction

During the 1960s, comparative politics became concerned with the problems of the developing areas, leading to a proliferation of books and articles on what are now familiar themes—political development, modernization, and nation building. In the 1970s, interest in these themes will no doubt continue, but at the same time problems relating to the advanced industrial societies will probably command increasing attention. A case in point is a recent study by Ronald Inglehart on intergenerational change in the industrial societies of Western Europe.¹

The question of what happens to politics when industrialization and economic growth produce affluence is both intriguing and important. For a time it was believed by some, for instance Daniel Bell, that affluence would lead to an "end of ideology." Recent events, such as the rash of student revolts and the rise of New Left protest movements in various countries, have cast doubt on the validity of that thesis. In this context, Inglehart's study is revealing and provocative, for it suggests, on the basis of survey research data, that affluence might lead in time to a restructuring of political loyalties in Europe.

Professor Inglehart develops his thesis by integrating theory and empirical data. His theory rests on the idea derived from the late Abraham Maslow's writings on human motivation that individuals have a hierarchy of values, "giving maximum attention to the things they sense to be the most unsatisfied needs at a given time."² According to this theory, human beings first must seek to fulfill subsistence needs—food, water, shelter—in short, economic security. When this basic need is met, individuals then seek higher values, namely sense of belonging, followed by self-esteem, and intellectual and aesthetic fulfillment. A further assumption is that individuals tend to maintain a given hierarchy of values "once a basic character has been formed during childhood and

youth."³ It would follow from this that the milieu in which a person has been socialized is important.

The most dramatic change in milieu that has taken place, according to Inglehart, is the rapid economic growth leading to affluence which nations in Western Europe have come to experience in the postwar era. Today's youth "have been socialized during an unprecedentedly long period of unprecedentedly high affluence. For them, economic security may be taken for granted, as the supply of water or the air we breathe once could."⁴ The result is a generation gap: the older generation, having been socialized in a period of scarcity, clings to acquisitive "bourgeois" values, while the younger generation gives priority to "postbourgeois" values "relating to the need for belonging and to aesthetic and intellectual needs."⁵ Inglehart foresees, moreover, that as the younger generation takes over during the next decades, either new political parties responding to value cleavages might emerge, or there might be a realignment of the social basis of existing parties. Specifically, in the past the middle class has tended to support conservative parties, whereas the working class has preferred the Left parties; but in the future the youth from middle-class families with postbourgeois values may support Left or New Left parties, while individuals from working-class families who have only recently acquired a taste for prosperity may become potential recruits for conservative parties because they will seek to defend or extend their recent gains.⁶

To test this theory of intergenerational change, Inglehart utilized empirical data drawn from Western European nations, namely, Great Britain, France, West Germany, Belgium, the Netherlands, and Italy. He found that since Britain had industrialized early, the relative size of the population with postbourgeois values was largest there, but also that other countries which had a higher economic growth rate than Britain in recent years, notably Italy and France, had experienced the largest amount of

intergenerational change in value priorities.⁷

The Japanese Case

One of the hazards of studying the political effects of industrialization is that historically it has been associated with Western nations. This raises the possibility that one's findings with respect to the consequences of industrialization and economic growth may be greatly influenced by Western history, society, and culture. Thus we need to introduce "controls" for historical, social, and cultural variables. One way to do this would be to look at an industrialized country that is not Western; Japan, which today is a leading industrialized power, is an obvious choice. One objection that could be raised is that Japan is not entirely free of Western influences. Undoubtedly Japan has become Westernized to a certain degree; nevertheless, it is also true that in value preferences and in interpersonal relations, the Japanese have managed to retain much of their own traditions. Most people would probably agree that an examination of the Japanese experience should afford us a better perspective in trying to understand what is going on in the nations of Western Europe.

Another advantage of looking at Japan is the availability of the kind of empirical data not easily found elsewhere. Professor Inglehart noted, for example, that he was studying changes in value priorities that have occurred over a long period of time, but that since relevant time-series data were not available he could not test his hypotheses directly.⁸ It so happens that the Institute of Mathematical Statistics, a government-supported but autonomous organization located in Tokyo, has conducted a series of national surveys bearing on national character at five-year intervals beginning in 1953, and repeated in 1958, 1963, and 1968.⁹ Thus we have access to a longitudinal

study that spans the period of economic growth, namely the late 1950s and the decade of the 1960s. So in a way we can test directly some of the effects of economic growth (the independent variable) on changes in value priorities in Japan.

Of course, the ideal situation would be to replicate the European study, but this is not feasible. So from the long list of questions that were asked in the national character surveys, a small number was chosen that appeared to get at some of the same value priorities that concerned Professor Inglehart. Particular attention has been paid to responses to questions that were asked in 1953 and in 1968 of respondents in two age groups, 20 to 24, and 50 to 54 years old. By so doing, two periods of time separated by fifteen years (during which economic growth took place), and two groups of individuals who were born 30 years or roughly one generation apart can be studied.

The basic assumption is that our samples should include sets of individuals with rather different life experiences. The 20- to 24-year-olds in the 1953 survey were born between 1929 and 1933. Therefore the assumption is that they must have gone through their early childhood during a period of economic depression, experienced early schooling in an atmo-

Table A. Sample Size of Age Groups in Four Surveys

Age Group	1953	1958	1963	1968
20-24	423	201 149	335	376
25-29	345	199 127	361	398
30-34	257	202 128	367	399

⁷ Inglehart, pp. 999-1000.

⁸ Inglehart, p. 993.

⁹ The national character survey data cited in this article were drawn from Tokei Suri Kenkyujo, *Nihonjin no Kokumin-sei* (Tokyo: 1961) and *Dai-2 Nihonjin no Kokumin-sei* (Tokyo, 1970). For the 1968 national survey a sample of 4,000 respondents was drawn. Metropolitan, urban, and rural areas were stratified in terms of population, region, and occupation. One election district was chosen from each of the areas, the probability of selection being proportionate to the size of the population. Respondents were chosen on a random basis from voter lists, with the size of the sample proportionate to the size of the population. From the 4,000 in the sample, 3,033 interviews were completed. The size of the sample for the four surveys according to age groups is given below. Two sets of figures are given for the 1958 survey. For Tables 1-5, use figures in the lower row; and for Tables 8-9 and 12-13 take the total of both rows.

sphere of increasing authoritarian and militaristic repression, suffered deprivation brought about by severe shortages of food and other necessities during the latter part of the war, and felt the dislocation—economic, social, and psychological—wrought by the trauma of defeat and subsequent military occupation by the victorious Allied Powers. This was a generation obviously buffeted by severe winds of change, and therefore one that might conceivably value economic security rather highly. Those in the 50 to 54-age group, by contrast, were born about 1900 and so went through the Depression and World War II as mature adults.

The 1968 sample, of course, focuses on individuals born between 1944 and 1948, and except for those born in 1944, it would contain the postwar generation. One presumes that in terms of early childhood experiences, they were probably not well off, because the early years of the postwar era were characterized by considerable economic dislocation; but it is also true that as they grew older, the economy also grew, so that by the time they reached their late teens there was a labor shortage and jobs were plentiful. The hypothesis is that this generation would be more likely to prefer postbourgeois values, while the older generation ought to be in favor of acquisitive values. Is the same kind of generation gap to be found in Japan as in Western Europe? I now turn to the Japanese data.

One of the questions in the national character surveys had to do with "goals in life." Respondents were given six choices and asked to pick one as their major life goal:

- (1) Work hard and get rich.
- (2) Study hard and make a name for yourself.
- (3) Don't think about money or fame; just lead a life that suits your own tastes.
- (4) Live each day as it comes, cheerfully and without worrying.
- (5) Resist all evils in the world, and live a pure and just life.
- (6) Never think of yourself; give everything in the service of society.

The first two questions in the list would appear to tap personal achievement values, while questions three and four are related to self-fulfillment and self-gratification. The final two, by contrast, point in the direction of "dogoodism." The responses from the four surveys are tabulated in Table 1:

What the table suggests is that during the fifteen years covered by the surveys, personal achievement values have remained stable, while the self-fulfillment and self-gratification priorities have risen. At the same time, lower value priorities are accorded to leading an exemplary life or working for the good of society.

We can get a better perspective on what is happening to these values by taking questions (1) and (3), which in my estimation roughly correspond to Inglehart's acquisitive and postbourgeois values, and breaking the data down by age groups. Table 2 shows changes in the value of getting rich over the 15-year period:

As Table 2 shows, the 20 to 24-age group has not become less acquisitive over the years, which is to say that affluence does not appear to have affected them. If this age group is compared with the older generation, that is, those in the 50 to 54-age group, it is clear that the older generation is somewhat more acquisitive and that the gap existed as early as 1953, well before the period of rapid economic growth.

Table 2. Age and Percentage Assigning Highest Value to Working Hard to Get Rich, 1953-68

Age	1953	1958	1963	1968
20-24	9%	12%	12%	13%
25-29	12	13	16	14
30-34	11	24	21	19
35-39	15	20	18	21
40-44	19	24	19	16
45-49	20	20	15	17
50-54	17	10	20	22
55-59	16	17	24	18
60-64	15	14	18	17
65-69	27	22	13	18
70-	27	10	13	11
Average	15	17	17	17

Table 1. Goals in Life, 1953-68

Year	Get rich	Fame	Suit one's tastes	Live cheerfully	Live pure	Work for society	Other; DK	Total	(N)
1953	15%	6%	21%	11%	29%	10%	8%	100%	(2,254)
1958	17	3	27	18	23	6	6	100	(920)
1963	17	4	30	19	18	6	6	100	(2,698)
1968	17	3	32	20	17	6	5	100	(3,033)

Table 3. Cohort Analysis of 20-24 & 50-54-Age Groups on Value of Getting Rich

Age Group	1953	1958	1963	1968
20-24 (50-54)	9% (17%)			
25-29 (55-59)		13% (17%)		
30-34 (60-64)			21% (18%)	
35-39 (65-69)				21% (18%)

Actually what may be operating here is life-cycle change. Youth still unburdened by family obligations feel that money is less important, but as they grow older they become more acquisitive out of necessity. Indeed cohort analysis of the data suggests this. In Table 3 are tabulated responses in successive surveys from the same age groups over the 15-year span.

The table shows that 9 per cent of the sample of 20- to 24-year olds in 1953 responded affirmatively to the question of working hard to make money, but that 15 years later the figure from that same age group had risen 12 percentage points. By contrast, the older generation stayed virtually the same.

A rather different profile emerges from question (3), which rejects seeking money or fame and favors instead leading a life that suits one's own tastes. The responses are tabulated in Table 4:

Table 4. Age and Percentage Assigning Highest Value to Leading a Life that Suits One's Tastes, 1953-68

Age	1953	1958	1963	1968
20-24	34%	38%	45%	51%
25-29	23	34	38	42
30-34	29	36	33	38
35-39	21	22	31	31
40-44	15	23	30	37
45-49	14	21	23	28
50-54	14	21	22	23
55-59	12	19	25	19
60-64	9	19	20	19
65-69	10	3	17	16
70-	5	10	12	11
Average	21	27	30	32

Again there is a generation gap, for as early as 1953, the 20- to 24-age group chose this value more frequently than the 50- to 54-year-old generation. But it is also evident that the proportion of youth responding affirmatively has risen with every survey, from 34 per cent in 1953 to 51 per cent in 1968. This suggests the possibility that long-term intergenerational change has been occurring. This interpretation appears to be confirmed by a cohort analysis of changes in the younger and older generations summarized in Table 5:

As will be noted, the percentage of those responding affirmatively has not changed very much among these age groups over the 15-year period. That is, the change that has occurred is mostly accounted for by each new age group's acquiring somewhat different value priorities. Thus, as the older generation dies off, there is a progressive shift in values in the direction, in this case, of self-fulfillment.

Another way of looking at acquisitive vs. postbourgeois values is provided by a question that states: "In bringing up children of primary school age, some people think that one should teach them that money is the most important thing. Do you agree or disagree?" The responses obtained in three surveys across all age groups is presented in Table 6:

In terms of the overall average, the majority of respondents agree that children ought to be taught that money is most important. There is some difference, however, between the 20 to 24 and the 50 to 54-age groups. The older generation is somewhat more acquisitive and has been as far back as 1953. But the percentage of respondents who agree with the question has

Table 5. Cohort Analysis of 20-24 & 50-54-Age Groups on Value of Leading a Life that Suits One's Tastes, 1953-68

35-39 (65-69)			59% (73%)

been declining somewhat over the years (from 65 per cent in 1953 to 57 per cent in 1968); and the change is especially marked among the young group, which suggests that intergenerational change may also be at work here. Again cohort analysis of these two age groups confirms the impression, for as Table 7 shows, samples from the same age group over a period of time show almost no change.

What about the espousal of postbourgeois

values, which, according to Professor Inglehart, characterizes youth in Western Europe? The Inglehart survey tried to measure postbourgeois values by scoring responses to two items, namely, "Giving the people more say in important political decisions," and "Protecting freedom of speech." Unfortunately, the Japanese national character surveys do not contain questions that get at exactly the same value dimension. Two questions, however, at least point in

30-34 (60-64)			24% (47%)	
35-39 (65-69)				26% (39%)

the same direction. The first one has to do with who should make political decisions. The question reads: "Some people say that if we get good political leaders, the best way to improve the country is for the people to leave everything up to them, rather than for the people to discuss things among themselves. Do you agree or disagree? Table 8 summarizes the replies:

The data show that the younger generation is much more reluctant than their elders "to leave everything up" to their political leaders. Again the gap is evident as early as 1953, but interestingly enough, it has narrowed over the years. There was a 22-percentage point difference in 1953, but only 7 percentage points in 1968 between the 20- to 24-year olds and the 50- to 54-year olds. What appears to be happening here is neither intergenerational nor life-cycle change, but rather adult change. This is a shift in attitudes in a certain direction among the adult population over a period of time. This is borne out by Table 9, which presents a cohort analysis of the two generations:

As Table 9 shows, the percentage of those among both the younger and older generations who agree to leave everything up to political leaders has in general declined somewhat.

The second question which would appear to be related to postbourgeois values has to do with the socialization of the young. "In raising

children of elementary school age, do you think it is more important to teach them to value freedom or discipline?" Table 10 summarizes the results:

Since this question was asked only in 1953 and again in 1968, we cannot follow the change (if any) that occurred in the intervening years. It is evident, however, that the majority of respondents, young and old, favor discipline over freedom. Japanese youth, in this sample at least, do not appear to be very rebellious. Still, proportionately more youth favor freedom than do older people, for in 1968, 34 per cent of the 20 to 24-year old group favored freedom in contrast to 17 per cent for the 50 to 54-year olds. Although there is not enough data to do cohort analysis, an examination of Table 10 suggests that this may represent a case of life-cycle change. For instance, 25 per cent of those in the 20- to 24-age group in 1953 favored freedom, but a sample from that same age group 15 years later revealed that only 16 per cent favored it. The opposite is true with those who favor discipline. In 1953, 56 per cent favored discipline, but by 1968 respondents in that particular group favored discipline even more strongly, registering a 73 per cent affirmative response. It appears that as people get older they favor freedom less and discipline more.

Table 10. Age and Percentage Favoring Freedom vs. Discipline in Raising Children, 1953, 1968

To summarize, Japan's youth, when compared to their elders, appear to be less acquisitive, more democratic, and somewhat more inclined to value freedom; in short, they show signs of preferring the kind of values defined by Inglehart as postbourgeois. Closer examination of the rather limited data suggests, however, that three kinds of value changes may be occurring: (1) intergenerational change, (2) lifecycle, and (3) adult. In the case of acquisitive values, there is a mixed picture. Responses to one question hint at intergenerational change, but another question suggests life-cycle. The same thing may be said of postbourgeois values. The question on living the kind of life that suits one's own tastes elicited responses that suggested intergenerational change; but the question on leaving everything up to political leaders implied that adults had been changing their values in a more democratic direction. In short, the view an observer gets of value changes in Japan is not so neat and tidy as the one Inglehart presents on Europe. I can only speculate about why this should be the case. More cross-currents may be operating in Japan because of the juxtaposition of tradition and modernity in Japanese society and culture. The greater complexity may also be an artifact of the kind of data available to the political analyst. If Professor Inglehart had had available to him the kind of longitudinal data I have used, he might have come out with a somewhat more complicated and therefore less tidy picture of the value change that had been going on in Europe.

Changes in Political Partisanship

What is the relationship between value changes and political partisanship? Inglehart believes, it will be recalled, that shifts in the social basis of parties may well occur in Western Europe during the next 20 years as a result of intergenerational change in values that has occurred and presumably will continue. Specifically, he suggests that "the presence of post-bourgeois values is linked consistently with a relative tendency to remain loyal to the Left, among those who were brought up in that tradition, and with a tendency to shift to the Left among those who were raised in other political climates."¹⁰ Unfortunately the data from the Japanese surveys do not allow this proposition to be tested directly in the Japanese setting.

Indirectly, however, some inferences can be made. If one assumes, as does Inglehart, that education is an accurate indicator of "parental affluence during the respondent's formative

Table 11. Education and Support for Socialist Party, 1968
Percentage Supporting Socialist Party

Year	Elementary & Middle School	College
1953	34%	33%
1958	53	36
1963	37	26
1968	40	22

years,"¹¹ then college-educated children, presumably having come from the more affluent families, ought to be the bearers of postbourgeois values. There is some data on the relationship between education and support for the Socialist party over the 15-year period.

Table 11 shows quite clearly that except for 1958, when the Socialists reached the peak of their popularity, support among those who went only to elementary or middle schools increased slightly. By contrast, support for the Socialist party among college-educated respondents has dropped (except for 1958). This would suggest that the situation in Japan is somewhat different from what Inglehart found in Western Europe.

Another way to look at partisanship is to relate it to age groups. In the past, age has been a good predictor of party support; that is, the young tend to prefer the Socialists and other Left parties, while the elders incline toward conservatism. Table 12 shows the relationship between age and party support:

As can be seen from Table 12, in 1958 there was a 26 per cent spread in support for the Socialists between the group of 20- to 24-year olds and the 50- to 54-year olds. The difference has narrowed in recent years, but the younger age groups generally remain more radical when compared to the older people. Another observation that may be made is that life-cycle change also appears to be present. This is consistent with the conventional wisdom that says that young people tend to be radical but become more conservative as they grow older. In 1953, 41 per cent of the sample of 20- to 24-year olds supported the Socialist party, but the same age group by 1968, now 35 to 39 years old, had dropped to 22 per cent. A third tendency that may be noted from Table 12 is the steady decline in support for the Socialists among youth in their early twenties during the 15-year span. This finding again is consistent with the argument that has been made by numerous journalists and observers that Japanese

¹⁰ Inglehart, p. 1013.

¹¹ Inglehart, p. 1005.

youth in recent years have become less radical. But in becoming less radical they have not necessarily become pro-conservative. Rather the evidence suggests that in recent years a sizable group of young people have withdrawn from active concern with the electoral process. Responses to questions about intention to vote in national elections are tabulated in Table 13:

A general decline in the commitment to vote in almost all age groups may be noted from the data in Table 13, but the decline is particularly steep among the younger age groups. Supporting evidence may be found in other surveys. Since voting is often regarded as a duty rather than as a right of every citizen, election commissions are actively engaged in trying to get as many people as possible to turn out on election day. It is not surprising, given this orientation, that the government should be interested in collecting data by means of surveys of who votes and who does not. According to government statistics, in 1952 about 15 per cent of those in their twenties, it is estimated, did not bother to vote in elections for the House of Representatives, but by 1969, the figure had risen to about 29 per cent, that is had almost doubled.¹² Moreover, in the 1968 national character survey, 31 per cent of the respondents in the 20- to 24-age group reported they supported no party (the highest of all age groups), and since this same group had the lowest percentage of individuals who intended to vote, the inference is that the fall-off in the commitment to vote must be related at least in part to an ebbing of partisan feelings.

There has been some speculation about why Japanese youth have become more apathetic in recent years. Lack of information probably can

be dismissed as a primary cause. Generally in public opinion surveys, the percentage of respondents in their twenties who say "Don't know" when asked about their views on international affairs and current political issues is lower than those in the older age groups, who are more likely to vote in elections. Perhaps this is to be expected, since the younger generation is usually better educated than their elders. Undoubtedly, part of the apathy is a reflection of negative sentiments toward the present political system. The prospects of changing the one-party dominant system in which the conservative Liberal Democratic party has held the reins of power for years are not bright, at least in the near future. Thus any person who seeks to use his vote to bring a new group of leaders to power understandably feels frustrated.¹³

It is also conceivable that the decline in electoral turnout reflects a rejection of the parliamentary system. There are some ultra-radical student organizations that nihilistically reject virtually all forms of authority. But the number of young men and women who belong to such organizations is very small and certainly unrepresentative of the great majority of Japanese youth.

It is doubtful that the inability to dislodge the conservatives or rejection of the parliamentary system represent major causes of the fall-off in electoral participation. I am inclined to believe that an important factor is the tendency toward individuation and privatization. A leading Japanese political scientist, Masao Maruyama, has argued that modernization in Japan has increased the desire for "individuation." By this he means that an individual has become "emancipated" from "communal ties which have hitherto bound him and which have pre-

scribed to him certain traditional behavior."¹⁴ Robert J. Lifton has described in his study of Japanese youth the concern young people have with the idea of *shutaisei*, which involves having and living by personal convictions, or selfhood, and joining with other like-minded people to achieve historical goals, that is having social commitment. "Their greatest difficulty," he continues, "is in realizing to their own satisfaction its first element, that of selfhood; and the sense of 'smallness' or the 'inferiority complex' which they talk so much about seems to reflect the great difficulty the Japanese have in perceiving and believing in a relatively independent self."¹⁵

One of the questions in the national character surveys cited earlier having to do with leading a life that suits one's own tastes (Table 4) may well be tapping this dimension, that is the search for selfhood, or individuation. It will be recalled that responses to this particular question indicated intergenerational change.

One of the several ways in which this individuation process can proceed is "privatization," which Maruyama defines as an orientation toward the "achievement of self-gratification rather than public goals" and a "withdrawal" or "retreatism" as a "conscious reaction against the increasing bureaucratization of the system and against the complexities of the social and political process in which he finds himself involved."¹⁶ There is some empirical evidence that privatization may be occur-

ring among sections of youth in Japan.

One of the questions in the 1968 national character survey sought to determine which had higher priority, individual rights or the public interest.

There are the following opinions, which one do you approve? Of course, it may depend on the situation and degree, but in general which one should be followed? (a) In order to give recognition to one's rights, it may be necessary that the public interest be sacrificed sometimes; (b) an individual's rights may have to be sacrificed sometimes in order to promote the public interest.

The responses are indicated in Table 14:

One might have hypothesized that young people, being more idealistic and less acquisitive, would favor promoting the public interest, but as Table 14 shows, this is not the case. If the 20- to 24-year old group is compared with the 50- to 54-year olds, there is a 17-percentage point difference, with youth favoring individual

rights over the public interest. The older generation was socialized in the prewar period when both the educational system and the official propaganda emphasized the duty of every person to subordinate his welfare to the good of the collectivity, whether it was the family, society, or the state. The younger generation, raised in a more democratic political atmosphere and educated in a school system that no longer emphasizes service to the state, appears to put higher priority on personal welfare and self-gratification.

In the absence of more detailed data, one can only speculate about why some Japanese youth should favor privatization. It is certain that economic pressures on youth lessened considerably in the 1960s, thanks to the high economic growth rate. The business boom, fed by rising exports as well as domestic consumption, led to persistent labor shortages. Jobs became more plentiful, and although prices were pushed upward by the inflation, wage scales rose even faster. All of this enabled Japanese youth to indulge themselves and to engage in the pursuit of pleasure and self-gratification. By contrast, the older generation, still bound by the traditional ethic that stressed individual sacrifice for the collectivity, continued to take its social responsibilities more seriously.

Conclusion

Since the available data are rather sketchy and not sharply focused on the problem at hand, one must be circumspect about drawing sweeping conclusions from them. It can be said, however, that different kinds of change—intergenerational, life-cycle, and adult—appear to be at work and that the general picture is less clearcut than the one Inglehart paints for Western Europe. I am inclined to believe that in Japan there is less a shift from acquisitive to postbourgeois values than a long-term change from a collectivity orientation to individuation. Indeed, the most parsimonious explanation for much of the data would be the trend toward individuation. For example, a shift away from acquisitive values may represent a weakening of the family as a cohesive unit. In the past the pressure for individual achievement usually came from parents who were eager that their children achieve fame and fortune because, among other things, this would help elevate the social standing of the whole family. I do not wish to imply that this is no longer the case, but it is true that family cohesion is weakening in the face of modernization. Likewise, the de-

cline in willingness to take the trouble to vote in national elections may be taken as a sign that community pressures are abating. Much of the time, voting may represent more an act of group conformity than an expression of one's political convictions. Finally, privatization, as has been suggested, may represent a form of individuation.

In any case, the Japanese data would seem to cast a shadow of doubt on the theory of a hierarchy of values which Professor Inglehart invokes to explain his thesis. Following Maslow, he argues that man's first goal is to meet his physiological needs and when he has attained them, he turns to social needs, followed by needs for self-esteem. Some critics have questioned the usefulness of this formulation in explaining human behavior and have also asked whether we are to "assume that the needs operate in all cultures and situations, or only in some."¹⁷ It is my contention that in Western culture, which has long stressed individualism, youth may seek a sense of belonging, whereas in Japanese culture, which has emphasized the group, youth may yearn for individuation and privatization.

What implications all this has for the future of Japanese politics is unclear. There are still no clear signs that new parties may emerge or that a realignment of the social basis of old parties may take place to reflect new cleavages in value priorities. If anything, many young people appear to be turning away from politics. This may be a short-run phenomenon, and a period of more active involvement in politics may yet appear, just as the political apathy found in many American campuses in the 1950s was replaced by the turmoil of the 1960s. At the very least, the direction of change in party loyalties becomes difficult to predict. There is now an element of uncertainty, portending that the political stability and incremental change characteristic of postwar politics in Japan may in time come to an end.

Finally, the Japanese data here analyzed calls into question the validity of generalizations about the political consequences of industrialization based solely on data drawn from Western nations. The rise of Japan to a status of a leading industrial power means that no one interested in the problem of the effects of industrialization and economic growth on politics can afford to ignore the Japanese experience.

Issue Area and Foreign-Policy Process: A Research Note in Search of a General Theory

WILLIAM ZIMMERMAN

University of Michigan

Is there a foreign-policy process? How does foreign policy making differ from policy making in the domestic domain? What is the impact of process on policy outcome? This note attempts to further our efforts to answer these questions by suggesting a general paradigm for the study of the foreign-policy process. The paradigm is explicitly synthetic; it combines insights generated by an early contribution of Arnold Wolfers to our understanding of the linkage between foreign-policy behavior and domestic political process with those prompted by two recent efforts by Theodore Lowi to affirm the nexus between issue and policy process. The paradigm, it is argued, makes it possible to specify the nature of the policy process (the identity of the major actors, the intensity of conflict) which will obtain in reasonably integrated modern states for a given case in point. It permits us to specify the social science literatures which are most germane to the generation of insights pertaining to the nature of the policy outcome. Finally, it gives us a framework within which it will be more possible to answer the old question about case studies: "Of what is this a case?"

The Pole of Power and the Pole of Indifference

Wolfers's essay¹ is largely devoted to ascertaining when in the name of analytic parsimony is it justifiable to disregard the impact of the internal workings of the state on foreign policy behavior. When, in other words, may one confidently expect that "black boxing" the state will serve the scientific goal of prediction? His answer is based on several propositions. It depends, he asserts, on whether the decision makers acting in the name of the state attach primary loyalty to the state and on whether, similarly, states are the sole corporate actors in the international environment.

¹ Arnold Wolfers, *Discord and Collaboration: Essays on International Politics* (Baltimore: The Johns Hopkins Press, 1962), pp. 3-35. Harold K. Jacobson reminds me that Wolfers was frequently less disposed than in "The Actors . . ." to accord predictive power to rational models, even at the pole of power—hence his emphasis on "National Security as an Ambiguous Symbol," *Discord and Collaboration: Essays on International Politics*, pp. 147-65.

The most relevant aspect of Wolfers's argument for the concerns of this article is his implication that a crucial determinant of the policy process is the nature of the issue at stake. He develops the relation of issue to policy process by asserting the existence of two poles—the pole of power and the pole of indifference—which may be conceived as end points of a continuum measuring the hierarchy of values of participants in the political process. With regard to the pole of power, Wolfers's analogy to individual behavior when someone yells "fire in the hall" should be familiar to all students of foreign policy. The preservation of the state is a goal highly esteemed by almost all decision makers. Consequently, a direct, profound threat to the existence of the state is in most instances likely to result in power maximizing behavior of the kind anticipated by those in the states-as-sole-actors tradition. What is frequently forgotten is Wolfers's suggestion that it is equally plausible to assume a predictable result in situations where "danger and compulsion are at a minimum. When not more than minor values are threatened by international discord, governments usually find it expedient to act according to established rule, since their interest in seeking others to do likewise exceeds their interest in winning an occasional and minor advantage"²—and hence one expects a high incidence of compliance with diplomatic protocol even by new states which have no part in establishing the rules. Thus, according to Wolfers, when events approximate either end of the continuum it is appropriate to expect that unitary, rational decision-maker models of state behavior will provide a close fit with reality. Under such circumstances, analysis of policy process or the perceptions of the decision makers would be reserved for the occasional deviant case.

Wolfers's analysis concedes too much to those who disregard the internal workings of the state or the minds of those who act in its name. It is by no means clear that in the atomic age the response of all decision makers to the functional equivalent of fire in the hall will be similar and highly predictable. Wolfers observes that "in international politics, the house

² Wolfers, *Discord*, p. 16.

is not always, nor everywhere, on fire although the temperature may not be comfortable even under the best of circumstances."³ What he fails to note is that in international politics, even when the house is on fire, staying within the house may be preferable to going outside. The divergent exhortations "Better red than dead" and "Better dead than red" symbolize the extremities among a wide range of alternatives which *might* be adopted by U.S. decision makers when core values are threatened. The range of responses to the Soviet missiles in Cuba in 1962 actually advocated by members of Kennedy's entourage lends further support to stressing the severely limited predictive power of models which disregard microanalytic phenomena, even under crisis conditions, when applied to superpower behavior.⁴ The response of lesser powers to armed intervention by a superpower is likewise much affected by micro-analytic variables: The propensity to fight if attacked—as the Yugoslavs since 1968 have repeatedly told themselves and others—appears greatly dependent on national culture and level of development. Even in crisis situations one disregards the perceptions of decision makers—and the elements which shape perceptions—at one's peril. We have progressed too far in our awareness of the impact of organizational structure and small-group dynamics on policy outputs not to include these in assessments of policy outcomes.

These caveats notwithstanding, Wolfers's argument is highly suggestive. It intimates an important explanation for the durability of the "billiard ball" model of international politics. Autocracies and republics alike in the nineteenth century were much more restricted in the scope of their activities than are their twentieth-century counterparts. Given the norm of *laissez faire*, the bulk of state actions in international affairs was concentrated precisely on the tasks of protection and the facilitating of interaction between states (the exchange of information and diplomats) and, in the mid-nineteenth century, regularizing the exchange of mail and telegraphic dispatches between individuals of various states. In terms of Wolfers's continuum, nineteenth-century state activity in international affairs was bimodally distributed. By contrast, twentieth-century liberal democracies and modern dictatorships alike extended the scope of their activities. For twentieth-century states the preoccupations of decision makers have been more normally distributed along

a continuum reflecting the values of the relevant internal actors. A reasonable graphic aggregation of such states' behavior might look like a normal curve skewed somewhat toward the pole of power (Figure 1). For events located at the poles of power and indifference, the analysis of domestic politics *as such politics is commonly understood* may be largely disregarded. (The qualification is an important one; I am not suggesting that, for instance, politics is absent in crisis decision making—only that the participants in the process act as individuals rather than as spokesmen for groups, institutions, or major strata of society.) For these events it suggests a rationale—aside from the

Distribution of State Activity

Figure 1.

presumably asymmetrical impact of the external environment—for the study of foreign policy separate from the study of "domestic" political processes. A corollary, furthermore, is that there exists an enormous range of events between the two poles for which domestic politics as normally understood is immensely relevant. In the large majority of "foreign policy" cases the analysis of policy process is of major concern.

Arenas of Power

It is the existence of policy processes which alter as a function of issue area⁵ ("arena of

³ Wolfers, p. 15.

⁴ Graham T. Allison, *Essence of Decision: Explaining the Cuban Missile Crisis* (Boston: Little, Brown, 1971).

⁵ Other contributions to the "issue area" literature include several community power studies—Robert A. Dahl, *Who Governs: Democracy and Power in an American City* (New Haven: Yale University Press, 1961); Nelson W. Polsby, *Community Power and Political Theory* (New Haven: Yale University Press, 1963); Aaron Wildavsky, "The Analysis of Issue Contexts in the Study of Decision-Making," *Journal of Politics*, 24, (November, 1962), 717–32; and James N. Rosenau, "Pre-theories and Theories of Foreign Policy," in *Approaches to Comparative and International Politics*, ed. R. Barry Farrell (Evanston: Northwestern Univ.

power" in Lowi's terminology) which constitutes Lowi's fundamental insight.⁶ The argument of each article may be summarized briefly. In "American Business, Public Policy, Case-Studies, and Political Theory," Lowi identifies three major arenas of power which, he contends, constitute the major patterns of politics in the United States and, in an aside, excludes foreign policy from his analytical scheme.⁷ The three issue-areas he labels the arenas of distribution, regulation, and redistribution. What separates one issue area from another is the extent and manner in which the political goods in a case in point can be disaggregated. Those domestic issues which are highly subject to disaggregation Lowi labels the politics of distribution. "Pork barrel" items typify this issue area; the political goods are readily subject to being parceled out to the major units. Nearly everyone (read, everyone who counts politically) gets—in the contemporary argot—a piece of the action.

The arena of regulation, by contrast, is the domicile of the group theorists. Coalitions of like-minded groups represent the major patterns of alliance as the classic question of who gets what is decided. In such instances the po-

litical goods are not as subject to disaggregation as they are in distributive politics. Where it is often difficult in the distributive arena to identify specific losers, there are always losers in the regulatory arena. "In the short run the regulatory decision involves a direct choice as to who will be indulged and who deprived."⁸ Some will not obtain a liquor license in Ann Arbor, just as some will not obtain an overseas air route.

If the arena of regulation is one in which the models of pluralist theorists provide a close approximation to reality, redistributive politics are the domain of elitists such as C. Wright Mills. The actors neither are groups nor are they the firms or individuals typical of distributive politics. Rather, the impact of the event is felt by far larger aggregates—social classes, "peak associations," movements. Since, moreover, the (perceived) relative status and power position of such aggregates is thought to be at stake—the political goods involved being both tangible and nontangible—disaggregation is extremely limited.

In "Making Democracy Safe for the World," Lowi's focus and argument shifts somewhat. Whereas in "American Business, Public Policy . . .," Lowi dismisses foreign policy in a footnote, in "Making Democracy Safe for the World," his central concern is with the foreign-policy process. His major conclusion is that there is no substance to the view that "foreign policy-making is a fundamentally different policy-making system, or one that is in any considerable way insulated from domestic political

Press, 1966) pp. 27-92 and "Foreign Policy as an Issue-Area," in *Domestic Sources of Policy*, ed. James N. Rosenau (New York: The Free Press, 1967) pp. 11-51.

⁶ Theodore J. Lowi, "American Business, Public Policy, Case Studies and Political Theory," *World Politics*, 16 (July, 1964), 677-715; "Making Democracy Safe for the World: National Politics," in Rosenau, *Domestic Sources*, pp. 295-331.

⁷ Lowi, "American Business . . ." p. 689, n. 17; "Foreign policy, for which no appropriate '-ion' word has been found, is obviously a fourth category."

⁸ Lowi, pp. 690-91.

Lowi's Arenas of Power: A Summary

Chart I

Arena	Primary Political Units	Patterns of Interaction	Power Structure	Foreign Policy/ Domestic Policy
I. distribution	individual, firm	log rolling; "unprincipled" alliances of uncommon interests	nonconflicting elite with support groups	both
II. regulation	group	"the coalition;" shared subject matter interest aggregation	pluralistic, multi-centered	both
III. a. protection b. interaction	individuals "without their institutions"	"team norms"	highly elitist	foreign policy
IV. redistribution	classes, movements generations	"peak associations"	conflictual elite: elite and counter elite	domestic

(Borrows heavily from Lowi, "American Business . . . , p. 713.)

forces."⁹ Instead, he again finds that "three predictable subsystems" may be identified. For foreign policy they are: (1) "an elitist subsystem (although involving a much smaller elite than the 'power elite') that prevails (a) in crisis and (b) in any noncrisis situations in which in the short run no internal resources are involved at all;"¹⁰ (2) "a logrolling pattern . . . similar to . . . [domestic] distributive politics;"¹¹ and (3) a pluralistic regulatory subsystem in which conflicting groups are the main actors. This time it is redistribution which is relegated to an aside.¹² From the two articles, thus, four separate policy processes are identified. The two Lowi articles are summarized in Chart 1. Each, Lowi concludes, has modal actors and patterns of interaction. Two, distribution and regulation, are useful for both the study of domestic and foreign policy. One—arena III—presumably is unique to foreign policy while the fourth, redistribution, is restricted to the domestic domain.

An Issue-based Foreign Policy Paradigm

One element which serves to link the Wolfers and Lowi pieces is immediately evident. Apparently entirely independent of Wolfers, Lowi has "discovered" the poles of power and indifference. Like Wolfers, Lowi concludes that for events at these two poles, the policy process does not involve the nongovernmental, societal actors, or patterns of interest articulation and aggregation typically found in "domestic" politics. Beyond that, there is a clear ordering in the stakes for which politics is played in the arenas of distribution, regulation, and redistribution—an ordering which relates to Wolfers's continuum. For if the poles of power and indifference are the extremities of a continuum measuring the values of decisional participants, it follows that the arenas of distribution, regulation, and redistribution may be located in ascending order on such a continuum:

and the policy process for issues which may be properly subsumed under the regulatory interval along Wolfers' continuum would predict-

⁹ Lowi, "Making Democracy Safe . . .," p. 314.

¹⁰ *Ibid.*, p. 324.

¹¹ *Ibid.*

¹² *Ibid.*, p. 325, n. 61: ". . . it is interesting to note the absence of a foreign-policy variant of redistribution. This might be due to my incomplete coverage rather than to a datum about the system."

ably correspond to the conflictual, pluralistic group politics which is the mode of the regulatory arena.

The issue, of course, then becomes by what criteria shall the intensity of the stakes or values at issue be measured. Again the linkage between Wolfers's and Lowi's analysis stimulates an answer: If, in terms of process, the politics of protection and interaction are similar and if the poles of power and indifference do represent the ends of a continuum, then it ought theoretically to be possible to treat that continuum as circular and to identify and label a matrix in which the poles of power and indifference may be appropriately located in the same cell.

Lowi's assertion is that the reason for the similarity between the policy process of crisis politics and that of such foreign-policy acts as recognition is that both have no short-run domestic political consequences.¹³ The assertion that crisis politics does not have domestic political consequences seems, however, sufficiently bizarre—in the era of the fifteen-minute war the consequences may be felt in the very short run—to warrant an alternative hypothesis.

The kind of "apolitical" consensual politics associated with protection-insuring and interaction-facilitating policies occurs when the dominant perception of all involved is that the impact of the decision will be *symmetrical* in its impact on the values of citizens. If most citizens are affected in the same way, regardless of the substance of the decision, instances of protection and interaction are directly analogous to distributive politics. In all three instances, decisions have a symmetrical impact domestically. Either the decision has no perceived impact, or there is a threat to the core values of the society, or all the relevant political actors are indulged. Under both regulation and redistribution, by contrast, there are those who are indulged and those denied. An event will be either regulative or redistributive if in the short run its effects are nonsymmetrical in impact.

At the same time, politics in the arena of interaction and protection shares something in common with politics in the arena of redistribution: all these issues involve values which are not confined entirely to tangible resource allocations matters alone. Rather, in the case of all three, nontangible issues are clearly at stake. Interaction issues involve no domestic resource allocation questions. Events properly classed within the arena of protection by their very nature pertain to the core values of the society. Redistributive issues, as we have seen, entail the reallocation not only of tangible goods be-

¹³ *Ibid.*, p. 324.

tween classes and other large elements in society but also such nontangible and highly important values as the redistribution of status and power in society. Each contrasts with the arenas of distribution and regulation—the special preserves of resource allocation issues.

The answers, then, to two questions serve as the basis for a paradigm of foreign-policy processes. These questions are: (a) Is a decision perceived to be symmetrical in its impact on politically relevant domestic political actors? (b) Are the political goods at issue exclusively tangible? (Figure 2). By ascertaining answers to these questions, one should be able to predict the nature of the policy process and to stipulate the social science literature most likely to facilitate the generation of insights relevant to the prediction of outcomes. An affirmative answer to both questions predicts that the issue will be distributive. As such, the primary political units, and the patterns of interaction and power structure are those predicted for the arena of distribution (Type I policy process), and the theoretical literature recommended is largely that of E. E. Schattschneider.¹⁴

A negative answer to question (a), i.e., the decision is perceived to be asymmetrical, coupled with an affirmative answer to (b), similarly classifies the issue as regulatory (Type II) and informs us that this is an occasion when the usual analysis of domestic politics by the group theorists will be entirely appropriate for a "foreign policy" issue.

By contrast, a positive response to (a) and a negative answer to (b) informs us that rational

¹⁴ *Politics, Pressures, and the Tariff* (New York: Prentice-Hall, 1935) and Lowi's summary of Schattschneider in "American Business . . .," pp. 680–682.

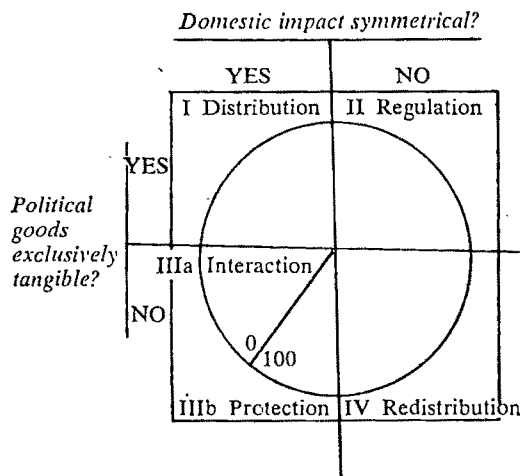

Figure 2. An issue-based foreign policy paradigm.

policy models augmented by a grounding in social psychology—specifically, literature treating the behavior of small groups, information processing by individuals and organizations (e.g., cognitive dissonance), deviant behavior—and a thorough awareness of the ubiquitousness of high politics will be relevant to the prediction of outputs. Similarly, it permits one to assert with some confidence that such traditional societal inputs into the policy process as interest articulation may be dismissed as effectively irrelevant to the outputs for such Type III issues.

Finally, should the answers to questions (a) and (b) both be negative, one would properly conclude that foreign-policy issues may indeed be redistributive and thus to assert that elite theorists and specialists on internal conflict¹⁵ constitute relevant authoritative sources for inspiration.

The Unlimited Politics of Limited War

It is to the fourth type of policy process that we now turn. The advantages of the scheme set out here will be modest if the fourth type of policy process has no empirical-world referents. If the fourth cell is virtually devoid of entries, then the only gain over Lowi's categorization would derive from the way in which the questions underlying the paradigm facilitate the task of distinguishing between distributive, regulative, and protective/interactive policy processes.

It can, however, be shown that certain important foreign-policy acts are redistributive and do manifest a policy process which one predicts for the redistributive arena. One major class of such redistributive events is limited wars. Strictly speaking, not all limited wars are redistributive. The war may be so brief or otherwise limited that no opportunities would be foregone domestically. Those involved in actual fighting would be limited to professional military personnel—whose promotional opportunities are accelerated by a war (if they survive)—and the resources utilized would be drawn exclusively from those procured before the outset of the war. A limited war may at the outset widely be perceived as the initial phase of a general war¹⁶ or as part of a general security strategy. While these perceptions hold, the policy process will be consensual-elitist rather than

¹⁵ Harry Eckstein, ed., *Limited War* (New York: The Free Press, 1964); Lewis A. Coser, *The Functions of Social Conflict* (Glencoe: The Free Press, 1956).

¹⁶ Kenneth N. Waltz, "Electoral Punishment and Foreign Policy Crises," in Rosenau, *Domestic Sources . . .*, p. 279, points out that in July, 1950 "just over half" the Americans polled thought the United States was "actually in World War III."

conflictual-elitist (Type III, rather than Type IV). Nevertheless, in practice limited wars have been searing events in American history. Knowing the history of the War of 1812, the War with Mexico, the Spanish-American War,¹⁷ or the Korean War,¹⁸ one would hardly be surprised to learn that the war in Vietnam has engendered high domestic conflict or to be informed that the politics of the war have at times resembled those of internal war. Viewed against a paradigm of policy processes—rather than, for instance, against a conception of foreign policy conducted by a rational, unitary decision maker—the nearly unlimited politics of limited war becomes readily understandable and in fact predictable. While the values at stake are less central to the core values of the society than those in genuine crisis situations, they extend far beyond those at issue in resource allocation questions. (Indeed, one ploy which the ruling group may adopt in order to mute conflict is to escalate the war to a point where general war may become a genuine possibility—in effect attempting to change the issue from a Type IV to a Type III policy process.) Limited wars are distinctively asymmetrical in their domestic political consequences. In discussing redistribution as a policy process relevant for certain internal events, Lowi observes, following Wallace Sayre, that the relevant cleavage is between those who provide the money and those who demand the services. What makes limited war even more acutely conflictual than most domestic redistributive issues is that the cleavage is not between money-providing and service-demanding segments of society but rather between those who demand the money and those who provide the services.

All four cells thus seem to have predictive implications for the analysis of the American foreign policy process. When an event is generally perceived as being distributive we can state with some confidence on the basis of previous case studies how the policy process is going to operate and which kinds of literature about politics are most likely to be productive of insights. In the case of crisis decision making, similarly, the highly elitist pattern involving the

legitimate decision maker and his coterie of advisers acting “without their institutions” characteristic of Type III protective interactive policy processes will be observed. An event like a limited war with a dramatically asymmetrical impact on society and involving intense (although not core) nontangible as well as tangible values soon will engender class warfare, generational confrontation, acute sectional strife, or other highly conflictual politics.

Directions for Future Research

Even without the research urgently needed to test the range of applicability of this paradigm, we can at least address ourselves tentatively to the range of states for which the paradigm has intuitive relevance. We have already sketched certain limits. One obvious qualification is that the state must have achieved minimal social and political consensus. In the absence of such consensus, a direct threat to the existence of the state will not be perceived as a threat to core values. A second qualification concerns the relationship of the regime to society. For our purposes, modern totalitarianism may be conceived as an effort by the regime artificially to re-create the qualities of the absolute monarch's state by insulating itself from the forces operative in “normal” complex industrial states (as well as by rendering itself impermeable to outside influence). If the regime succeeds, all policy disputes will resemble in their *process* those associated with the protective-interactive arena (Type III).

Within these clear limits, the paradigm may prove of some predictive value. Indeed, the task of comparison may be well served if we hold issue area constant and depict the manner by which, within a given issue area, differences in political structure and political culture affect the general contours of the policy process. For most developed, pluralist states, the paradigm certainly seems plausible.

Recent work by Roland Pennock, for instance, while not germane to foreign policy, suggests that what we have called the distributive arena is a major feature of British politics. Pennock attacks the conventional notion that the pork-barrel, log-rolling politics typical of the distributive arena are characteristically American. “It is true,” Pennock grants, “that what has come to be defined as the pork-barrel phenomenon does not exist in Great Britain.” Nevertheless, he asserts,

If we look at the use of public funds for the benefit of identifiable groups, farmers, old age pensioners, recipients of general public assistance, manufacturers, and the like, something bearing a distinct family resemblance quickly appears. . . . Legally

¹⁷ The literature on each is extensive. Recent capsule depictions of the internal politics of the three are to be found in Samuel E. Morison, Frederick Merk and Frank Freidel, *Disseint in Three American Wars* (Cambridge: Harvard University Press, 1970).

¹⁸ John E. Mueller, “Trends in Popular Support for the Wars in Korea and Vietnam,” *American Political Science Review*, 65, (June, 1971), 358–75 shows the striking similarity in mass attitudes to the wars in Korea and Vietnam. He concludes that popular support decreases logarithmically with the increase in American casualties.

established minimum wages for agricultural labor, tariffs, and other benefits to manufactures, constitute in a larger sense a "package deal" that is not sharply dissimilar from the American "pork barrel." It is implicit log rolling, or vote trading, and it apportions benefits to special groups, the cost of which is spread throughout the taxpaying or, as the case may be, consuming public.¹⁹

My own research has indicated that in Yugoslavia a procedure for disaggregating resources to politically relevant units at the expense of the general interest is well established. In the Yugoslav context, those which count politically are republic party organizations and, frequently, large republic-specific enterprises. Evidencing only minimal national integration, Yugoslavia is a country whose political elite is fearful that tangible resource allocation questions, via the catalyst of republic-level nationalism, will be transformed into a redistributive issue. Thus, Yugoslavia displays an unusual propensity to disaggregate resource allocation decisions. For students of the American political process, the result is predictable. Even though for Yugoslavia to compete internationally economic rationality would prescribe an intensive strategy, the political process ordains a strategy of putting a few eggs in several baskets. A railroad terminating in the Croatian city of Rijeka is followed by its counterpart through Serbia to Bar. Ship building and harbor modernization funds are parceled out accordingly, each republic with an Adriatic outlet being indulged. Even major foreign service appointments are parceled out; insufficient "ticket-balancing" may result in the vetoing of an ambassadorial appointment, for instance, by a *republic* assembly.

A recent study by Donald C. Hellmann²⁰ illustrates the relevance of the regulatory arena to the explanation of Japanese foreign-policy behavior in negotiating a peace agreement with the Soviet Union. Hellmann discovers that in the course of negotiating a peace agreement with the Soviet Union, "neither a clear public sentiment nor a broadly based articulate opinion emerged in [in Japan]."²¹ He further finds that business interests generally played a negligible role in the decisional process—notwithstanding the close interlinkage of business, party, and government in Japan, an interlinkage bearing a resemblance to C. Wright Mills's power-elite image (Type IV) of American de-

cision making. With a single exception, Hellmann concludes, the process of negotiating the peace agreement with the Soviet Union was highly elitist, in exactly the sense predicted for Type III issues.

The one exception proves interesting. "One economic issue, Japan's fishing rights in the northern seas, did figure significantly in Soviet relations. Accordingly, the Japanese fishing industry actively participated in the negotiations, seeking access primarily as an interest group working for its own benefit."²² The fishing rights issue was tangible and highly asymmetrical in its domestic impact in Japan—a fact of which Moscow was well aware. Moscow in effect utilized the fishing rights facet of the settlement in order to alter the Japanese political process and thus to alter the outcome of the negotiations. By linking the peace settlement with fishing rights in the northern seas, what was otherwise a Type III protective-interactive issue became instead a kind of international licensing issue, i.e., a Type II regulatory issue.

One imagines, further, that the hypotheses pertaining to the arena of redistribution are transferable to other pluralist systems. A close comparison, for instance, of the domestic politics of Great Britain's Boer War and France's war in Indo-China with the domestic politics of the United States' war in Indo-China would presumably prove these events sufficiently congruent as to justify extending the projections about the redistributive politics of limited wars to all pluralist systems.

Finally, with regard to the protective-interactive arena it seems reasonable to assume tentatively that it is the United States which constitutes the limiting case. As such, we may assume that in other pluralist systems (several of which have less participant political cultures)²³ the decisional process will be no less elitist than in the United States. Bluntly put, crisis decision making appears to be much the same the world

¹⁹ J. Roland Pennock, "The 'Pork Barrel' and Majority Rule: A Note," *Journal of Politics*, 33 (August, 1970), 709–16, at 714.

²⁰ Hellmann, *Japanese Foreign Policy and Domestic Politics: The Peace Agreement with the Soviet Union* (Berkeley: Univ. of California Press, 1969).

²¹ *Ibid.*, p. 149.

²² *Ibid.*, p. 130. Hellmann's conclusion warrants comparison with another important case study in which fish played an important role. I have in mind, of course, Bernard C. Cohen's *The Political Process and Foreign Policy: The Making of the Japanese Peace Settlement* (Princeton: Princeton University Press, 1957). Once again the fish issue was the only really controversial aspect of the settlement. The peace settlement itself provoked little debate. The fisheries issue was settled separately by the North Pacific Fisheries Convention—a process which had all the attributes of regulatory politics. There were, thus, for the United States two issue areas: one, the peace settlement (Type III); the other, the regulatory fisheries convention (Type II). (For a similar assessment, see Rosenau, ed., *Domestic Sources*, pp. 48–49.)

²³ Gabriel Almond and Sidney Verba, *The Civic Culture* (Boston: Little, Brown, 1965).

around; military grand strategy is likewise formulated in a manner according with a rational purposive model.²⁴

Perhaps the most intriguing test of the utility of the paradigm both for its predictive capacity and for its value in reorienting research, however, is not whether the paradigm has relevance for pluralist systems other than the United States. Rather, the crucial question stems from the implication of the paradigm that for comparable events in divergent political systems the policy process within an issue area is sufficiently similar as to explain or predict the foreign policy process. If such is the case, then, the paradigm has predictive value for states which are *neither* totalitarian *nor* pluralist but rather modern authoritarian systems characterized by a polyarchy of elites.

Such a country is the Soviet Union. Do the political structure and political culture of the Soviet Union so greatly shape the nature of policy formation as to preclude the value of issue-related hypotheses in the Soviet case? Nothing approaching a definitive answer can be given in this article—which is intended to prefigure my own further research and to redirect others' research orientation. We can state with considerable confidence that crisis decision making in the Soviet Union is highly elitist in the Type III protective-interactive sense.²⁵ More generally, we can assume that, in terms of process, events subsumed within the protective-interactive arena will correspond to that anticipated by the paradigm. The problem of course is that such a finding by itself is completely consonant with an explanation of the absence of domestic societal influences (save those transmitted through the personalities of the leadership) based on the nature of the political system.

We must look to the other arenas of power to speak to the relation of issues on policy process in the Soviet Union. Since for U.S. foreign policy a major manifestation of distributive arena politics is the intraservice parceling-out of the military budget, a replication of Samuel Huntington's *The Common Defense* in the Soviet context might be in order.²⁶ Such a replica-

tion would make it possible to ascertain whether there are fundamental distinctions in process, as in the United States, between Soviet force-procurement and Soviet strategic decisions, and whether the relevant service branches, ministries, and industrial enterprises are indulged through a disaggregation process brought about by "unprincipled" coalitions from within the Soviet counterpart to the military industrial complex.²⁷

In the Soviet Union, during the post-Stalinist period, influence relations and communications patterns are asymmetrical. Given the interaction between the Soviet society and the regime, and given the redistributive character of limited wars, I would expect that, were the Soviet Union to become extensively embroiled in such a war (say in the Middle East), the domestic political process would resemble the American experience with the Vietnam war; the only major qualification would be that the active role of large social aggregations (nationalities, generations of "fathers and sons" in conflict) would be more circumscribed because of Marxist-Leninist political culture and the Soviet political system. I would fully expect that elites and incipient counterelites would employ symbols designed to appeal to such large social aggregates and that the anticipated response of these political actors would be predominant in shaping the process of intra-elite political behavior. To take a case in point: had the Czechoslovak regime elected in 1968 to resist forcibly the Soviet invasion, and had it succeeded in transforming the Soviet action into a limited war, the fissiparous tendencies within the Soviet Union would have been immense. Indeed, if Alexander Dubcek had made credible the possibility Czechoslovakia would resist, the Soviet policy debate prior to the invasion would have been dramatically altered. The choice would no longer have been intervention with its foreign policy consequences or nonintervention with its foreign-policy costs and the dangers of domestic contamination (especially in the Ukraine)²⁸ from the Czechoslovak disease. Instead, the Politburo would have had to choose between nonintervention, with its possible domestic dangers, and intervention, with the at-

tendant domestic costs of waging a limited war against a small, friendly, socialist state.

Where political structure probably does have a major impact on the Soviet foreign-policy process is in the arena of regulation. In recent years, considerable work has been done on Soviet interest groups,²⁹ much of it rather desultory in character and almost none of it bearing on foreign policy. That there is an interest articulation process seems no longer seriously at issue; what remains to be clarified is whether, given the prohibition against associational interest groups, the process is suitably depicted by conceptions derived from Western group theorists; i.e., whether the claims for resource allocation priorities are best conceptualized as

the articulation of groups, groupings, or tendencies.³⁰

In any event, viewed against an issue area framework, the traditional dichotomization of authoritarian and pluralist foreign-policy processes needs re-examination. To the extent that the argument developed herein withstands extensive testing against the empirical record, the impact of political structure on process would seem to be considerably more circumscribed than generally assumed. The ultimate conclusion may even be that differences in policy process across issue areas within a given state, the United States or the Soviet Union as cases in point, may be as great as differences in foreign-policy process within a particular arena of power for each.³¹

²⁹ The best is Milton Lodge, *Soviet Elite Attitudes Since Stalin* (Columbus, Ohio: Charles E. Merrill, 1969). See, too, Joel J. Schwartz and William R. Keech, "Group Influence and the Policy Process in the Soviet Union," *American Political Science Review*, 62 (September, 1968), 840-851, and H. Gordon Skilling and Franklyn Griffiths, eds., *Interest Groups in Soviet Politics* (Princeton: Princeton Univ. Press, 1971).

³⁰ E.g., the articles in Skilling and Griffiths.

³¹ After this article was written, Thomas L. Brewer published an important contribution to the literature linking issue-area and foreign-policy behavior in the American case. See his "Issue and Context Variations in Foreign Policy: Effects on American Elite Behavior," *Journal of Conflict Resolution*, 17 (March, 1973), 89-114.

Party and Incumbency in Postwar Senate Elections: Trends, Patterns, and Models*

WARREN LEE KOSTROSKI

Wittenberg University

In the last half-century or so, incumbents of all offices for which we have data have exhibited greater strength at the polls than have their electoral rivals. Of those incumbents who have sought to retain their position, city councilmen have succeeded about 80 per cent of the time;¹ state legislators have defeated between 70 and 90 per cent of their challengers;² United States senators have achieved re-election in more than 80 per cent of their attempts (as shown in Table 2); and congressmen have emerged victorious at a phenomenal 90 per cent rate.³ Pity the poor vulnerable governor:

* This is a revised version of a paper presented at the Thirtieth Annual Meeting of the Midwest Political Science Association, Chicago, April 27-29, 1972.

I am indebted to many people for their help in this study. Among those who improved this paper by reading and commenting on earlier drafts are Walter Dean Burnham of the Massachusetts Institute of Technology, Lawrence S. Mayer of the Virginia Polytechnic Institute and State University, Eric Uslaner of the University of Florida, and Ronald E. Weber of Indiana University. The two anonymous referees saved me from several errors and helped clarify the exposition. I am grateful to Washington University for making available the requisite computer facilities. Most of all, though, my thanks go to John D. Sprague of Washington University for sacrificing much time and energy to preach what he practices, superior scholarship. Finally, I gleefully adopt what may turn out to be the new fashion in academic writing: I claim full credit for whatever is worthwhile in the study, and blame all errors on my benefactors.

¹ At least this is the case in the San Francisco Bay area. See Kenneth Prewitt, "Political Ambitions, Volunteerism, and Electoral Accountability," *American Political Science Review*, 64 (March, 1970), 5-17, at p. 9.

² For example, in Connecticut during the period 1946-1958, 982 out of 1201 incumbents won re-election to the state legislature, for a success rate of 81.8 per cent (James David Barber, *The Lawmakers* [New Haven: Yale University Press, 1965], on p. 8); and David Leuthold reports an incumbent success rate of 73 per cent in Missouri state races during the period 1960-1964 (*Electioneering in a Democracy* [New York: Wiley, 1968], p. 127). See also Charles S. Hyneman, "Tenure and Turnover of Legislative Personnel," *Annals of the American Academy of Political and Social Science*, 195 (1938), 21-31, for data covering ten state legislatures over the decade 1925-1935. Finally, Wisconsin data collected by three of my students, Gary Londergan, Patrick Maguire, and Timothy Smock, show an even higher state-level success rate than those found elsewhere. Of the 50 state senators running for re-election in the period 1958-64, 46, or 92.0 per cent, won. Of the 315 state assemblymen running for re-election in the period 1956-62, 271, or 86.0 per cent, won.

³ Computed from figures supplied in Charles O. Jones,

the last three decades have seen him taste victory "only" 64.7 per cent of the time.⁴ It certainly appears that for the office-holder in an election, as for the property-holder in law, possession is worth about nine points. Yet it is not clear that incumbents win only, or even mainly, because they are incumbents. Other factors, such as the strength of the incumbent's party in the constituency involved, could be producing these results.

This paper is concerned primarily with incumbents for the office of United States senator. The two questions it seeks to answer are the following: (1) To what extent do incumbent senators win because they are incumbents, and to what extent do they win because their party is strong in their state? (2) How has the relative importance of party and incumbency in Senate elections changed during the postwar period? These questions merit investigation for at least three reasons. First, an understanding of the role of party in influencing the way Americans vote for subpresidential offices is a necessary complement to the knowledge thus far gained about how the American voter thinks and behaves in presidential contests. Second, the degree to which incumbency helps assure re-election speaks directly to some fundamental notions of the representativeness and (especially) the responsiveness of elected officials and institutions in the American political system. Third, the role of seniority in shaping the behavior of senators, and thereby the policies issuing from the upper chamber, is surely of sufficient consequence to warrant examination of the factors determining seniority itself, namely, re-election. In addition, the answer to the longitudinal question provides fuel for the ongoing debate about whether there is presently underway some sort of "realignment" of American electoral politics. We shall return to some of these questions at the conclusion of the paper.

The study consists of four main parts. First comes a brief review of some of the literature

Every Second Year (Washington, D.C.: The Brookings Institution, 1967), p. 68.

⁴ Computed from figures supplied in J. Stephen Turrett, "The Vulnerability of American Governors, 1900-1969," *Midwest Journal of Political Science*, 15 (February, 1971), 108-32, at p. 118.

on congressional elections dealing with our central question—the relative influence of party and incumbency on electoral outcomes. The second part then describes some of the contours of phenomena probably unfamiliar to most scholars, namely, the extent to which senators have run for re-election during the period 1948–1970, and the extent to which those running have been successful. Both rates (running and winning) are strikingly high. The third part begins to deal with the problem of separating out the effects of party and incumbency in Senate elections. The fourth and final section constitutes the core of the analysis. It develops a theory accounting for the outcomes of Senate elections in terms of the major potential sources of electoral support given to the candidates. The theory is then represented symbolically in formal models for which multiple regression techniques are used to generate quantitative estimates of the relative importance of party and incumbency in all postwar Senate contests. This section closes with a brief summary of the findings and a statement regarding their implications for the changing shape of contemporary American politics.

Literature Review: Incumbency and Congressional Elections

The major recent work on the electoral effects of House incumbency has been carried out by Milton C. Cummings, Charles O. Jones, and Robert S. Erikson. Cummings devoted an entire chapter to the topic in his excellent volume, *Congressmen and the Electorate*,⁵ analyzing its relationship to such phenomena as "Presidential tide," third parties, and special local factors. One of Cummings's research questions was quite similar to what we ask of senatorial races: How important is the strength of the *party* in a given constituency, and how important is the strength of the individual (e.g., incumbent) *candidate* in shaping the electoral outcome? The answer his data convey is that "party" is by far the more consequential of the two, although incumbency does in fact have a significant independent impact.⁶ For example, in the period covered by his analysis, incumbent representatives of the party that lost the presidency fared much better than nonincumbents of that losing party. More precisely, 84.7 per cent of the House candidates who won in the face of an unfavorable "Presidential tide"

were incumbents.⁷ Indeed, even in the party "rising with the tide," incumbents do better than nonincumbents, although the difference is of course much less pronounced.

Charles Jones's research in this area further underscores not only the "independent" electoral advantage of House incumbents, but also the importance of "party" in influencing election results. For example, even when an incumbent is not running (i.e., has died, retired, or been defeated in a primary), the *incumbent party* candidate is likely to prevail three-fourths of the time.⁸ Obviously, then, there is more at work than "incumbency" in assuring a congressman re-election; the nature of the district is often such that his party is strong, or the opposition party is weak, or both.

Another effort to gauge the independent influence of incumbency in House elections is that of Robert Erikson.⁹ He used multiple regression techniques with data from 1954 to 1960 to determine the percentage of the vote accounted for by incumbency. His analysis shows the advantage of House incumbency to be about two percentage points. In a subsequent study Erikson found that by the late 1960s, the advantage had grown. For example, in 1966 being a House incumbent was worth about five percentage points.¹⁰ These patterns are especially suggestive in the light of the finding to be reported in the present paper that the advantage of *senatorial* incumbency, despite variation, has generally increased in the postwar period.

The principal works dealing directly with the electoral impact of senatorial incumbency are Donald R. Matthews's classic study, *U. S. Senators and Their World*,¹¹ and Barbara Hinckley's recent article, "Incumbency and the Presidential Vote in Senate Elections: Defining Parameters of Sub-presidential Voting."¹² Unfortunately, not all of Matthews's findings are directly comparable to those reported

¹ Computed from figures supplied in Cummings, p. 60.

⁶ A fair inference, it would seem, from the data presented in Cummings, pp. 78–79.

here since, for example, this study does not analyze senators in terms of his "career type" classification (i.e., Amateur, Professional, Patrician, Agitator). It is worth noting, however, that he was able to demonstrate clearly that a senator's chances for re-election are indeed related to the degree of party competition in his state.

Hinckley's article explores the question of "how much of the fluctuation in vote for Senator is explainable by the 'pull' of the presidential vote,"¹³ on the one hand, and how much can be explained by senatorial incumbency, on the other. Employing as the standard the state-by-state estimates of base party identification developed by Ronald Weber and Frank Munger,¹⁴ she tries to determine how much of the deviation from this standard can be statistically explained by her two variables. Through a simple correlation analysis, she concludes that in the period 1956-1966, 64 per cent of the fluctuation in voting is accounted for by this pair of nonidiosyncratic factors.

Although there is some overlap between Hinckley's concerns and those of the present paper, the two studies differ in several crucial respects. For one, while Hinckley's investigation utilizes data only from the decade 1956-1966, the present inquiry covers nearly the entire postwar period. More important, however, is the manner in which the two sets of data are analyzed. For example, Hinckley treats the entire decade as a single, highly aggregated unit of time, examining neither differences between the parties nor changes over time. The present work examines both. In addition, the statistical technique used in the Hinckley piece is correlation, while the principal method used here is multiple regression. This latter method seems clearly preferable for at least three important methodological reasons: (1) it forces us to be explicit about the *form* of the relationships we posit when we construct the models for which the parameter estimates are to be generated; (2) it enables us to concentrate primarily on

the *shape* of the relationships being examined rather than focusing exclusively on the less interesting and really less enlightening "goodness-of-fit" criterion of correlation analysis; and (3) it provides us with actual *prediction equations* which we can then use to identify deviant cases, a procedure which has as one of its desirable outcomes the likelihood of learning something new and unexpected about the political world.¹⁵

Incumbency and Senate Elections: Postwar Patterns and Trends

This section addresses two principal sets of questions. To what extent have senatorial incumbents run for re-election? To what extent have those running been successful? In dealing with the first phenomenon, I shall deal exclusively with the overall pattern, investigating differences between presidential and off-year elections, and attempting to determine whether there is a trend over time. With the main concern of the paper, the "success rate" of senators, the analysis proceeds a step further. In addition to looking at the *overall* pattern, presidential and off-year differences, and trend, the analysis also separates *by party* and goes through the same procedure once more.

"Few die and none resign,"¹⁶ says the only slightly overstated Capitol Hill aphorism describing the extent to which congressmen cling to their jobs. There is ample justification for applying it as well to the behavior of senators during the last quarter-century. Of the 392 general Senate elections during that period, 320 involved incumbents.¹⁷ That is, 81.6 per cent of

¹³ Hinckley, p. 838.

¹⁴ Ronald E. Weber and Frank Munger, "Party Identification and the Classification of State Party Systems," paper delivered at the 1968 Annual Meeting of the American Political Science Association, Washington, D.C. Their basic approach is to use what is known about the relationship between party identification and the demographic and socioeconomic characteristics of voters to construct a number of "voter-types." Determining the proportion of a state's electorate fitting each such "type" permits an estimate of each party's identifiers in that state. The approach is similar to that employed in the Simulatics project reported by Ithiel de Sola Pool, Robert P. Abelson, and Samuel Popkin in *Candidates, Issues, and Strategies*, rev. ed. (Cambridge: MIT Press, 1965).

¹⁵ Arguments and evidence for this general position can be found, among other places, in Ronald J. Wonnacott and Thomas H. Wonnacott, *Econometrics* (New York: John Wiley & Sons, Inc., 1970), especially pp. 124-25; Edward R. Tufte, "Improving Data Analysis in Political Science," in *The Quantitative Analysis of Social Problems*, ed. Edward R. Tufte (Reading, Mass.: Addison-Wesley, 1970); and, for the *coup de grâce* to the goodness-of-fit criterion in theory construction, William Feller, *An Introduction to Probability Theory and Its Applications*, Volume II (New York: John Wiley & Sons, Inc., 1966), p. 52. The relevant portions of Feller's point are summarized and quoted in Adam Przeworski and Glauco A. D. Soares, "Theories in Search of a Curve," *American Political Science Review*, 65 (March, 1971), 51-68, in fn. 34 on p. 67.

¹⁶ Clem Miller, *Member of the House* (New York: Charles Scribner's Sons, 1962), quoted at p. 93.

¹⁷ *Incumbent* is defined here, and throughout the study, as a senator who has achieved the office through *election*, even a special election. Rates of running and winning always refer only to general election contests. A person holding the office at the time of the general election by virtue of appointment was not considered an incumbent. The reason for this distinction is presented in the final section.

Although I do not deal with primary contests here, I

those contests saw a senator seeking to remain in office. While even this figure does not match the ninety-plus House percentage (for 1956-1966),¹⁸ it is impressively high nonetheless.

As Table 1 indicates, there appears to be very little difference between presidential and off-years in the rate at which incumbents choose to seek re-election. The rate for presidential years is 82.1 per cent, for off-years 81.1 per cent. For purposes of comparison, it is worth noting that a similarly minor difference between the two types of election years occurred for the House during the decade 1956-1966: in presidential years—91.3 per cent of the races involved incumbents; in off-years—90.0 per cent.¹⁹

Figure 1 depicts the per cent of Senate contests involving an incumbent in each election year of the period under scrutiny. To determine whether these data contain a trend, the percentage of races involving incumbents (the "y-values") are regressed on time (the "x-values"), where $T = 1$ in 1948 and $T = 12$ in 1970. This results in the equation

$$(1) \quad \hat{P} = 0.05 T + 81.3,$$

showing the trend (slope) to be nearly zero. This technical operation adds weight to an impressionistic conclusion that there has been no real increase in the postwar period in the rate at which senators have run for re-election.

The belief prevalent on Capitol Hill is not only that congressmen *want* to remain in

might note for the record that only about 7 per cent of the postwar senators who sought renomination were denied it, a higher figure than the House's 1.6 per cent (from data in footnote 3), to be sure, but still small enough to pose no real problem to the present analysis.

¹⁸ Computed from figures in Jones, *Every Second Year*, p. 68.

office, but also that they ought to be able to succeed in doing so. Charles Clapp, in *The Congressman*, summarizes the views of representatives thus: "There is a tendency to believe that, aside from isolated instances where an overriding issue is present, there is little excuse for defeat."²⁰ To what extent is this belief borne out in fact for the House counterparts, the Senators?

The number and per cent of senatorial incumbents running and winning are given in Table 2. Despite some fluctuations over time, the unmistakable generalization emerges that senators are usually returned to office. Out of 320 incumbents seeking re-election, 269, or 84.1 per cent, won. Moreover, there is virtually no difference between presidential and off-years. In presidential years, 135 out of 161 senators defeated their challengers, for a success rate of

83.8 per cent; in off-years, 134 out of 159 incumbents prevailed, for a rate of 84.3 per cent. Once again the pattern is similar to that for House members (for 1956-1966)²¹: presidential years—92.7 per cent were successful; off-years—92.3 per cent were successful.

A more detailed and direct comparison of the overall Senate rate with that of the House is provided by Table 3, showing the number and per cent of congressional and senatorial incumbents successful in their bids for re-election during the seven election years from 1954 to 1966. Both rates are high and unexpectedly close, at least given the conventional wisdom that senators are significantly more vulnerable: House—92.8 per cent; Senate—88.2 per cent.

Interestingly enough, the postwar trend has been toward even greater safety for senatorial incumbents, as Figure 2 amply illustrates. Re-

Source: House figures computed from data supplied in Charles O. Jones, *Every Second Year* (Washington, D.C.: The Brookings Institution, 1967), p. 68, and, for 1954, in Charles O. Jones, "The Role of the Campaign in Congressional Politics," in *The Electoral Process*, ed. M. Kent Jennings and L. Harmon Zeigler (Englewood Cliffs, N.J.: Prentice-Hall, 1966), at p. 24. Senate figures, see Table 1.

Figure 2. Percentage of Elected Senatorial Incumbents Running for Re-election Who Won: 1948-1970

gressing the percentage of successful senators on the time variable produces the equation

$$(2) \quad \hat{Y} = 1.68 T + 73.0,$$

where $T = 1$ in 1948. In other words, each election year sitting senators have become, on the average, almost "two per cent safer." Over a period of twelve elections, such an average increase becomes substantial, indeed.

This increase in safety for incumbents is, of course, not confined to the upper house. Some indication of the trend for the lower chamber is contained in the observation of Charles Jones that, for the Congress, "... between 1932 and 1940, 69.9 per cent of the districts were won by the same party in all five elections; between 1942 and 1950, 74.0 per cent were won by the same party; and between 1952 and 1960, 78.2

per cent were won by the same party."²²

Useful as these overall findings are, they may very well obscure some important differences between the parties. As the comparable data arrayed in Table 4 effectively demonstrate, that is, in fact, the case. While about 90 per cent of Democratic senators won re-election, "only" about three-fourths of the Republicans were so fortunate. Whether this difference is due to the Democrats' superior campaigning skill, greater money and charm, and more attractive families, or whether this difference in *incumbency* success rate is due more systematically to dif-

²² Jones, p. 68. Note, however, that this trend refers to the safety of districts for the *party*. Although we assume the general pattern is similar for the safety of *incumbents*, an empirical demonstration of that assumption's validity is clearly beyond the scope of the present paper.

Table 4. Number of Elected Senatorial Incumbents Running for Re-election; Number and Percentage of Winners, By Party: 1948-1970

Source: See Table 1.

ferences in *party* strength in the electorate, remains to be seen. Indeed, it is precisely this question that is explored initially in the next part, and analyzed further in the final section of this paper.

Comparing the pattern for each party in presidential versus off-year elections reveals that there is no appreciable difference *within the parties* between the two types of election years. For the Democrats, the presidential year success rate is exactly 90.0 per cent, with the off-year rate an almost identical 90.6 per cent. For the Republicans, the difference is only slightly greater. In presidential election years, 76.1 per cent win, while in the off-years the figure is 74.6 per cent.

To determine whether the postwar trends for the two parties differ, consult Figure 3, which presents in graphical form the percentage of each party's senatorial incumbents who were successful each election year. As with the earlier estimates of trend lines the percentage successful is regressed on time to produce a trend for the Democrats described by the equation

$$(3) \quad \hat{Y} = 0.46 T + 86.5,$$

where $T=1$ in 1948. Although there is some movement toward greater safety, it is fairly small. But according to the equation, the Democrats start out so safe (an average of about 87 per cent win in 1948, solving at $T=1$) that even the slight increase of five or six percentage points over the past quarter century could have important political consequences.

The trend for the Republicans is far stronger. Their equation reads

$$(4) \quad \hat{Y} = 2.91 T + 58.4,$$

where $T=1$ in 1948. Here we find that Republican senators won only about 60 per cent of their re-election bids immediately following the War, but now win, on the average, more than 90 per cent of them. This marked change suggests once more that we must ask whether the Republican gain is due to their party having grown stronger (and/or the Democrats weaker), or to a greater independent electoral importance assumed by incumbency.²³ Analysis of this question is, of course, the task of the next two sections of the paper, with the final part paying special attention to the longitudinal aspects of the problem.

The discussion up to now has been confined to nationally aggregated patterns. Within-state patterns are suggestive as well.²⁴ For example, it is interesting to note that California had the

²³ Naturally, trend lines such as these are highly sensitive to extreme values at the end points of the time series. For example, adding 1946 to the present pair of series brings the two trend lines a good deal closer together due to the high success (100 per cent) of Republican incumbents and the low success (66.7 per cent) of Democrats in that year. The Democratic trend is then described by the equation, $\hat{Y} = 1.12 T + 81.1$, while the Republican estimate becomes $\hat{Y} = 1.54 T + 69.8$, where $T=0$ in 1946 in both instances. And yet despite such extreme readings, the difference between the parties does still remain, and still points to the same question: why the different rate of change for each party over time?

²⁴ These within-state patterns are based on data from 1946–1970.

Source: Table 4.

Figure 3. Percentage of Elected Senatorial Incumbents Running for Re-election Who Won: by Party: 1948–1970

smallest proportion of its postwar Senate contests involving an incumbent—four out of nine; the remaining states all had a sitting Senator vying for the seat in at least half, and sometimes all, of their Senate races. And a second observation, this one suggestive of the electoral power of incumbency, is that three of the four states that did worst in returning senators to office still re-elected incumbents fifty per cent of the time.²⁵ A success rate of one-half is what would be expected under the assumption of purely random outcomes of a win-lose situation, so the fact that the remaining forty-six states had success rates in excess of fifty per cent is consistent with the notion that incumbents have factors working systematically in their behalf.

Preliminary Analysis of the Relationship Between Party and Incumbency

Party strength is one of those systematic factors we suspect affects the incumbent success rate. Some idea of the extensive overlap, in a quite literal sense, between the two can be gained from the following simple "exercise": List all those states where both Senate seats were won by the same party in every general election of the last two-and-a-half decades. There are fourteen such states. Ninety-nine incumbent senators ran for re-election in those states and ninety-seven won. Now relax the

criterion for selection of the states to include those where the same party won both seats every time but once. There is now a total of twenty-two states in the list. Next, make up a separate list of all those states in which a senator seeking to remain in office always succeeded in doing so. There are twenty-six such states. This exercise reveals that seventeen states appear on both lists, a considerable overlap.

If this overlap operates as hypothesized, then the more politically competitive states ought to have lower senatorial incumbency success rates, and vice versa. One way to examine this hypothesis is to group the states according to some measure of political competitiveness and to compare the success rates. The rationale underlying Table 5 is that the "regional" groupings are much less competitive than the "large industrial" states, and that states in neither category fall between these two extremes of competitiveness. The senatorial incumbency success rates follow the expected pattern.

A somewhat more sophisticated classification of the states according to party competitiveness has been developed by Austin Ranney.²⁶ His scheme averages together four measures of Democratic electoral strength in state offices over the period 1946–1963 to produce an "index of competitiveness" that ranges from 1.0000 (complete Democratic control) to 0.0000

²⁵ Maryland retained in office only two of the six senators seeking reelection. The three states returning an even half of their incumbents are Kentucky, Pennsylvania, and Wyoming.

²⁶ Austin Ranney, "Parties in State Politics," in *Politics and the American States*, ed. Herbert Jacob and Kenneth N. Vines (Boston: Little, Brown and Company, 1965), pp. 61–99; see especially pp. 63–70.

Table 5. Number of Senatorial Incumbents Running for Re-election in Certain Categories of States; Number and Percentage of Winners: 1946–1970

Category of States ^a	Number of States	Number of Incumbents	Number Who Won	Percentage Who Won
Total South	11	77	76 ^b	98.7
Deep South	(5)	(38)	(38)	(100.0)
Fringe South	(6)	(39)	(38)	(97.4)
"Solid North"	7	49	48 ^b	98.0
Border	6	41	29	70.7
Large Industrial	7	44	31	70.5
Remainder	19	126	98	77.8

Source: See Table 1.

^a The states are categorized as follows: Deep South: Alabama, Georgia, Louisiana, Mississippi, South Carolina; Fringe South: Arkansas, Florida, North Carolina, Tennessee, Texas, Virginia; Border: Kentucky, Maryland, Missouri, New Mexico, Oklahoma, West Virginia (Maryland's Senators won only twice out of six tries, thus accounting for the lower than expected success rate for this category of state. If Maryland were omitted from the calculations, the per cent for this group would be 77.1); Large Industrial: California, Illinois, Michigan, New Jersey, New York, Ohio, Pennsylvania; "Solid North": Kansas, Maine, Nebraska, New Hampshire, North Dakota, South Dakota, Vermont.

^b For the curious, the one Southern Democrat failing re-election was Albert Gore of Tennessee in 1970, and the one "Solid North" Republican was Payne of Maine, who lost to Edmund Muskie in 1958.

Table 6. Number of Senatorial Incumbents Running and Winning in the States:
(States Classified According to Degree of Inter-Party Competition^a)
Percentage of Winners, By Category: 1946-1970

One-Party Democratic			Modified One-Party Democratic			Modified One-Party Republican

^a From Austin Ranney, "Parties in State Politics," in *Politics in the American States*, ed. Herbert Jacob and Kenneth N. Vines (Boston: Little, Brown and Company, 1965), pp. 61-100. The states are listed here within each category according to their decreasing "Democratic-ness." For a brief explanation of the "index of competitiveness" upon which these categories are based, see the text.

(complete Republican control). An index score of 0.5000 signifies that the parties are perfectly competitive. The resulting clusters of states suggested the categories reproduced here in Table 6.

Once again a clear relationship between party and incumbency emerges. The most competitive states have the lowest senatorial incumbency success rates, and the least competitive the highest. One interesting sidelight is the difference between the success rates in modified one-party Democratic states (80.3 per cent) and modified one-party Republican states (92.7 per cent). A possible explanation for the difference may lie in the extent to which the state party systems are allied to or coincide with the national party systems in Democratic-domi-

nated versus Republican-dominated states, for while Ranney's measure is based exclusively on state offices, the position of senator is usually considered a national office.

Because both the Ranney index and the incumbency success rate can be considered interval measures, and because a value for both variables can be assigned to each state, performing an experiment may identify somewhat more precisely just how these two phenomena are related. Since the concern in this instance is more generally with "competitiveness" than specifically in Democratic or Republican strength, we first reconstruct part of the Ranney index. Using the measure as it is given for the interval 1.0000 to 0.5000, the interval

0.4999 to 0.0000 is recalculated by subtracting each value therein from 1.0000. This more general index of competitiveness then varies from 1.0000, non-competitive, to 0.5000, perfectly competitive.

The hypothesis being investigated is that the more politically competitive the parties are, the less likely to achieve re-election a senator will be. Hence, the dependent variable, the senatorial incumbency success rate (measured by the proportion of times sitting senators seeking re-election in a given state during the postwar period were successful), is regressed on the independent variable, the revised index of competitiveness. The relationship between these phenomena is then expressed by the equation

$$(5) \quad \hat{SR} = 0.58 C + 0.42,$$

where \hat{SR} is the senatorial incumbency Success Rate and C is the degree of Competitiveness.

This result provides an extremely interesting substantive interpretation of the independent impact of senatorial incumbency on electoral outcomes. What it says is that in a completely noncompetitive state, whether controlled by Democrats or Republicans, senators will win re-election every time (solving for $C = 1.0$). At the other extreme, where the state parties are absolutely competitive ($C = 0.5$), senators will still defeat their challengers about seven times out of ten. If this result is to be believed, the "independent" (nonparty-related) advantage a senatorial incumbent brings to the polls is very real and quite substantial. The odds are clearly in his favor. Two caveats must of course be entered, however. One is that the result obtained employed what must be regarded as two fairly crude measures, despite the pseudo-accuracy of carrying out the estimates to four decimal places. The second is that the Ranney index, being based solely on state offices, would be expected to produce some "slack" in its relationship to the incumbency phenomena for a national office. In any event, however, the least that can be said of this finding is that it is highly intriguing and suggestive of even better methods of generating precise estimates of the types of relationships in which we are most interested.

Models of Party, Incumbency, and "National Tides"

Whatever the specific nature of the role of party and incumbency in Senate elections, there is obviously persuasive evidence that they both exert great influence on those electoral outcomes. To understand fully the electoral process therefore requires gauging as accurately as

possible their separate and independent impact on such elections. The mode of analysis employed here involves representing the theory in a formal model for which are then generated quantitative estimates of the appropriate parameters through least squares multiple regression. In constructing the model the strategy is to draw upon available knowledge about political behavior in order to approximate "reality" as closely as possible. In short, the procedure involves embodying certain beliefs about the political world in a formal representation, and then testing those beliefs against what data are most relevant to the questions at hand.

Theory and Model. The phenomenon to be explained, or predicted, is the percentage of votes received by postwar senatorial candidates, given certain other information about the election. To accomplish this task involves identifying the major potential sources of a senatorial candidate's electoral support. The argument presented here is that there are three systematic, measurable sources common to all Senate races and one group of unsystematic, unmeasurable sources peculiar to each contest. "Party loyalty," incumbency, and "national tides" fall under the first rubric, while such idiosyncratic factors as personality, issues, and local conditions compose the second group.

Party identification exerts an extremely powerful influence on voting in the United States. Angus Campbell and his associates estimated that of those voters in their 1952 samples who had formed no evaluations of "political objects" (i.e., no intervening variables entering into their vote choice), 75 per cent voted their party identification.²⁷ Moreover, a substantial degree of straight-ticket voting is associated with party loyalty.²⁸ In states where straight-ticket voting is facilitated by the ballot form used, 77 per cent of the strong identifiers supported their party right down the line, with a full 70 per cent of the weak identifiers following suit. Even in states where such voting is hindered by the form of the ballot, 55 per cent of the weak identifiers chose to stick with one party, while just as many strong identifiers as in the "easy" states—77 per cent—selected the straight ticket. And equally significant is the nature of the split ticket, when that route is chosen. The finding is that when voters do cross

²⁷ Angus Campbell, Philip Converse, Warren Miller, and Donald Stokes, *The American Voter* (New York: John Wiley and Sons, 1960), p. 142.

²⁸ The following figures are taken from Angus Campbell and Warren E. Miller, "The Motivational Basis of Straight and Split Ticket Voting," *American Political Science Review*, 51 (June, 1957), 293-312.

party lines, they are far more likely to do so for state and local offices than for senator or congressman.²⁹

But it must be emphasized that there are in fact degrees of party identification, such as the "strong" and the "weak" mentioned above, and that there are demonstrable differences in the manner in which those degrees of attitudinal commitment are translated into "party votes," as the ballot-form example amply illustrates. The most loyal and deeply committed party identifiers will vote "party" under even the most severe cross-pressures and counter-trends, while the remainder will be far more likely to defect due to election-specific personalities and the issues of the day. It will be important to bear this in mind in selecting the indicator of "party loyalty," for one is needed which taps the true core of the party supporters.

The second potential source of a candidate's support is derived from the fact of being the incumbent. Above and beyond party influences, an incumbent is likely to receive an additional increment of votes because he holds the office at the time of the election. This extra margin is evident in the literature review of the first part of this paper, the descriptive materials of the second part, and the experiment with the revised Ranney index of competitiveness and the various cross-tabulation analyses of the immediately preceding section.

We should be explicit about the reason the current office-holder has an electoral advantage, for it should not be thought that "incumbency" is some sort of magical, mysterious phenomenon. There are good solid political explanations for the incumbent's garnering additional support. Although they have been examined often enough by scholars to permit our doing without a detailed exposition here, it may still be worthwhile to provide at least a skeletal framework of the larger arguments.³⁰

(1) The incumbent is likely to have substantial political skill and experience, and often a superior political organization, owing to his having been through the mill, successfully, at least once previously.

(2) He should enjoy greater voter recognition than his opponent through having been in the public eye during the last campaign and during the preceding years of his term, through his use of the franking privilege, the carrying

out of casework, appearances at public events, and so forth. This simple fact of public awareness can prove incredibly powerful. Stokes and Miller³¹ have shown that in the 1958 congressional races, of those voters who were aware only of the candidate of their own party, 98 per cent voted for him; conversely, of those aware only of the other party's candidate, 40 per cent voted for him. Who, we may ask, is the average voter likely to be aware of more, an incumbent senator, or his challenger? While there are certainly some cases where the challenger is even more well-known than the senator (suppose Bart Starr ran against Senator Gaylord Nelson in Wisconsin, or Joe Namath ran for the Senate in New York . . .), the reverse is surely more common. We can probably say, then, that for senators as for congressmen, incumbents are more salient to the voters than are nonincumbents, and that "in the main, recognition carries a positive valence; to be perceived at all is to be perceived favorably."³²

(3) The office-holder is likely to have a fair amount of political clout within his party because of patronage, fund-raising activities, prestige, favors of all kinds. This should make it easier for him to acquire a wide variety of campaign resources, from workers, to information, to credit.³³ Moreover, since fund-providers probably prefer to back a winner,³⁴ and since the success rate of incumbents has presumably not been lost on potential contributors, the incumbent should find money considerably easier to come by than his opponent.

In addition to party and incumbency, a third systematic influence on the electoral support received by a senatorial candidate is what I term "national tides." Although it is *not* generally true that "As Maine goes, so goes the nation," it is generally true that "As the nation goes, so

²⁹ Donald E. Stokes and Warren E. Miller, "Party Government and the Saliency of Congress," chapter 11 in *Elections and the Political Order*, by Angus Campbell, Philip Converse, Warren Miller, and Donald Stokes (New York: John Wiley and Sons, 1966), pp. 194-211, at p. 205.

³⁰ Stokes and Miller, in Campbell et al., *Elections and the Political Order*, p. 205.

³¹ See Leuthold, *Electioneering in a Democracy*, for an admirable discussion of congressional campaigns largely in terms of resource acquisition. His observations and findings undoubtedly apply, *mutatis mutandis*, to senatorial contests as well.

³² Such an inference can easily be drawn from Leuthold, Table 1, p. 67, at least insofar as labor unions are concerned. In addition, chapter 6 deals with the whole range of fund-raising questions. A comment regarding incumbents is telling: "Nonincumbents may have needed more money but they found it harder to raise, and ended up with less money than incumbents" (p. 77).

²⁹ Campbell and Miller; see their Table VI, at p. 306.

³⁰ A brief review of the electoral advantages of congressional incumbency can be found in Stephen K. Bailey, *Congress in the Seventies* (New York: St. Martin's Press, 1970), pp. 9-11. See also Robert Erikson, "The Advantage of Incumbency in Congressional Elections,"

goes your state.”³⁵ The point is, of course, that state elections held at the same time as a national election tend to be influenced by the national issues being raised and discussed, as well as by the national candidates in a presidential election year. A number of scholars have worked with the notion of “presidential tides,” but they tend to neglect the very real fact that there are often equally strong trends, or “tides,” in the off-year as well, and that they usually register similarly in each state. Clearly, 1958, although an off-year election, exhibited such a “tide,” and few are in doubt as to its direction.

Just as the third part of the paper established that party and incumbency are related both to each other and to Senate electoral outcomes, it can be demonstrated here that “national tides” and incumbency are similarly related. This demonstration will add some indirect evidence that the phenomenon of “national tides” is worth including in the analysis. Let us take as a rough indication of the overall “national tide” for a particular year the difference between the percentage of the total votes cast for a party’s House candidates this election year and the percentage cast for their candidates the previous election year. For example, the 1958 Republican “tide” was -5.3 per cent, the 1958 Democratic “tide” was +5.3 per cent (the 1958 House percentage minus the 1956 House percentage). Next we take an analogous difference for each party’s senatorial incumbency success rates in those two election years. Comparing the two differences for each election year of the postwar period reveals that in ten out of twelve elections the differences have moved in the same direction. The only two years they do not (and the discrepancy occurs in the same years for both parties) are 1952 and 1962, and in both instances the margin by which they fail to do so is almost negligible. Furthermore, the R^2 produced by a regression of the (differences between) senatorial incumbency success rates on the “national tides” variable exceeds 57 per cent for both parties.

So the conclusion is that “tides” do indeed systematically influence (Senate) elections. Yet the “tides” will have different effects in different states and, unlike the other phenomena, can have a punitive influence on the outcomes for one party while helping the other party. The most extreme example of the differential effects by state occurred in 1964. While virtually the entire country was sweeping toward Lyndon

Johnson and the Democrats, the five states comprising the Deep South were moving quite dramatically in the opposite direction, against the Democratic “tide.” Such an occurrence is of course perfectly consistent with the argument that these states were in fact responding to the same national issues and personalities as the remaining states; that they chose a different stand on the issues (especially race) and personalities is of no consequence to the theory. It does remind us, however, that since our analysis is state-centered, the “tides” variable must vary across states as well as over time. And it underscores the fact that failure to control for such phenomena in the analysis could have a confounding effect on our understanding of the relationship of central interest here, that between party and incumbency.

The final source of votes for a candidate involves such idiosyncratic elements as personality, issues, and local factors. In some elections, of course, these could conceivably outweigh all others, though it is the contention here that such an event is rare. The effect of these idiosyncratic factors is not measured directly, but is estimated indirectly, as will be shown below.

The reasoning thus far forms a basis for representing symbolically what has been stated in words. Bear in mind, however, that our “theory” comprises our words and sentences and hypotheses about politics; the model is but a shorthand formalization of its main features. It cannot be overemphasized that what we constantly seek are sentences about the political world; the symbols and numbers we employ are merely means to that end.

With that said, then, the theory is represented thus:

$$(6) \quad S = f(P, I, T, Id)$$

where:

S = the per cent of the votes received by a particular senatorial candidate,

f = means “a function of,”

P = “core party loyalty,” or “base party vote,”

I = incumbency,

T = “national tides,”

Id = idiosyncratic factors.

In words, this says that the percentage of votes received by a particular senatorial candidate is a function of the proportion of the voters who are “core party loyalists”; his status as an incumbent or nonincumbent; the magnitude and direction of the “national tides”; and, finally, his personality, the issues raised, and other local factors (e.g., the strength of the party organization and his relationship to it, the power of the labor unions and their traditional

³⁵ The close relationship between national and state electoral results is documented in Louis Bean, *How to Predict Elections* (New York: Alfred A. Knopf, 1948) and in V. O. Key, Jr., *American State Politics* (New York: Alfred A. Knopf, 1956), especially in chapter 2.

role in elections in that state, factionalism, etc.).

The theory is represented symbolically in this most *general* form to emphasize that there are any number of different *specific* forms the relationships could take. These various sources could be seen as being strictly additive in their effects, as the formal model in (9), below, indicates. But it is also plausible to assert, for example, that the particular portion of the voting population that will be most likely to vote for a candidate because he is the incumbent are those who are not "core party loyalists" for either party, for those loyalists are so locked into their party that they will vote for or against a candidate purely on the basis of his party label. Then, if P_d represents the proportion of the electorate which supports the Democrats under any and all conditions, and P_r represents those solidly loyal to the Republicans, then $1 - (P_d + P_r)$ stands for the proportion in neither group. Given our working hypothesis, and still assuming for convenience that the effects of the phenomena in (6) are additive, this revised theory could be represented as

$$(7) \quad S_d = a(P_d) + b(I)[1 - (P_d + P_r)] + c(T) + Id$$

where the statement has been restricted to Democratic candidates for ease of comprehension. Naturally, a , b , and c are parameters measuring the increment of support given the candidates from the indicated source.

An alternative formulation involves the contextual argument that although a certain proportion of the population is likely to vote for one party because of some individual loyalty or commitment, there is also a group effect. Hence, as Warren Miller, for example, found, at the higher concentrations of party strength, the interaction among the party faithful increases, as does the probability of their voting for their party's candidates.³⁶ This might be represented by the model

$$(8) \quad S = a(P * P) + b(P) + c(I) + d(T) + Id$$

where $(P * P)$ is, under random mixing assumptions, the probability that a given interaction involves one party loyalist interacting with another party loyalist, and a is the probability that the interaction will result in an additional vote for the senatorial candidate of that party. The rest of the model stands as before.³⁷

³⁶ Warren E. Miller, "One Party Politics and the Voter," *American Political Science Review*, 50 (September, 1956), 707-25.

³⁷ For a stimulating analysis of left voting which em-

phases the importance of the *form* of the relationships among phenomena, as well as a more detailed development of the "contextual" argument, see Przeworski and Soares, "Theories in Search of a Curve." On the problem of forms of relationships as it relates to an American electoral situation, see Walter Dean Burnham and John D. Sprague, "Additive and Multiplicative Models of the Voting Universe: The Case of Pennsylvania, 1960-68," *American Political Science Review*, 64 (June, 1970), 471-90.

$$(9) \quad S = a(P) + b(I) + c(T) + Id$$

is the model for which are estimated the parameters a , b , and c , and the intercept, Id .

Variables. The task now is to select the variables to be used as indicators of the phenomena the theory stipulates as most important. The variable for S is simply the percentage of the total popular votes cast for each major-party senatorial candidate in each state at each general election from 1948 to 1970.³⁹

Several contenders could serve as the variable measuring P . Two are especially attractive. The first is the set of estimates of base party identification developed initially by Ronald Weber and Frank Munger and used by Barbara Hinckley in her article on Senate elections cited earlier. The measure is described briefly in footnote 14 of the present paper. Unfortunately, two serious limitations prevent their adoption here. One is that the estimates are currently available only for the period 1954-1966, yet the present study examines the entire postwar period. The other difficulty attending the Weber estimates is that they are

phases the importance of the *form* of the relationships among phenomena, as well as a more detailed development of the "contextual" argument, see Przeworski and Soares, "Theories in Search of a Curve." On the problem of forms of relationships as it relates to an American electoral situation, see Walter Dean Burnham and John D. Sprague, "Additive and Multiplicative Models of the Voting Universe: The Case of Pennsylvania, 1960-68," *American Political Science Review*, 64 (June, 1970), 471-90.

³⁸ The two alternative forms mentioned here, as well as several others, are developed further and the parameters estimated in my paper, "Form and Substance in Theory Construction: Electoral Behavior in Postwar Senate Elections," presented at the Annual Meeting of the American Political Science Association, Washington, D.C., September 5-9, 1972. In addition, the contextual argument is elaborated in that paper several steps beyond the sketch given here.

³⁹ The source relied upon for all election data was the *Statistical Abstract of the United States* (Washington, D.C.: Government Printing Office, various dates). Errors noted were corrected (e.g., on two occasions special Senate elections were listed in the general election category) but otherwise the figures were used as given. Incumbency information was culled from the sources listed in Table 1 of the present paper.

attitudinal measures, while a behavioral measure is preferred. There are important differences between base party *identification* and base party *vote*.

Consequently, the "base party vote" measure used for the variable *P* in the model is constructed in the following manner. (1) Compute the per cent of popular votes cast for the House candidates of each party in each state for each election year from 1946 to 1970. For example, for a given state in a given year, the Democratic figure is calculated thus:

$$\frac{\text{Total number of votes cast for all Democratic House candidates}}{\text{Total number of votes cast for all House candidates}}$$

(2) For a given election year, say, 1960, choose as the "base party vote" for each state (i.e., the value for *P*) the *lowest* per cent of votes for House candidates cast in that state during the five election years of which the "target year" (in this instance, 1960) constitutes the midpoint year. In other words, for a particular state (e.g., Wisconsin) look at the percentage of votes garnered by the congressional candidates of a particular party (e.g., the Democrats) in each of the following years: 1956, 1958, 1960, 1962, 1964. The lowest Democratic percentage of those five elections is the Democratic "base party vote" for the midpoint year of the series, 1960. The same operation is carried out separately for the Republicans.⁴⁰

Observe that this procedure involves going a maximum of only four calendar years away from the target year to get the value of *P* for that year. Knowledge of the glacier-like pace at which *core* ("strong") party loyalty changes certainly suggests that such a short span of time is very unlikely to misrepresent the size of the group of loyalists. And yet there is being employed a behavioral measure of the proportion of the electorate in a given state which, by its *actions*, has demonstrated that it will support a given party under the severest conditions "of recent memory."

Two principal difficulties, neither of them crippling, make this choice of variable less than ideal. For one, although the vote for House candidates probably approaches better than most the notion of a "normal" party vote,⁴¹

it is not perfect. Ironically enough, there is bound to be some distortion introduced by the fact that many House candidates are incumbents! The extent to which this is true will vary somewhat among states and between parties, to be sure, but the problem is nonetheless a real one.⁴² Some correction is afforded by choosing the worst performance out of five elections, for even though most incumbents will probably *win* in trying times, their *share* of the vote is probably diminished, and it is the percentage received rather than the won-loss record that is the relevant datum.

The second problem with the measure is that of turnout. More people vote in presidential than in off-year elections; furthermore, the types of people voting differ between election years. These differences are likely to introduce distortion into any kind of measure of "party vote" based on actual votes. Yet the problem is less serious in fact than its potential suggests. For a study by Harvey Kabaker designed to test the extent to which turnout does actually influence the partisan division of the vote in *congressional elections* concludes that the effect is really quite minimal.⁴³ Hence there is reason to have some confidence that this indicator of "base party vote" is in fact measuring what our conceptual apparatus says it should.

Choosing a variable for incumbency is a simple operation. If a candidate is the current office-holder, and has achieved the position by virtue of an *election*, he is considered the incumbent. An election, rather than an appointment, is required because a principal source of strength for an incumbent, as argued above, is the political skill, organization, personal following, and recognition that results from having waged a successful campaign. In addition, appointees are sometimes selected to fill a vacancy precisely because they pose no real political threat to the governor appointing them; yet the governor can use the opportunity to reward favors bestowed. Evidence of the role of these factors is the lower re-election rate experienced by appointees as compared with those who

Elections and the Political Order, Campbell et al., pp. 9-39.

⁴² An extreme case is that of Nevada, where the "base party vote" for the Democrats exhibited an exceptionally strong and consistent increase during most of the postwar period. Whether this is due to a "true" growth of Democratic loyalists or to the fact that there is only one Representative who, having been the incumbent since 1956, has been able to steadily tighten his hold on the electorate over the last decade and a half, is a moot question. The potential for distortion in such a situation is clear.

⁴³ Harvey M. Kabaker, "Estimating the Normal Vote in Congressional Elections," *Midwest Journal of Political Science*, 13 (February, 1969), 58-83.

⁴⁰ At the end points of the election series, the following modifications prevailed: the "base party vote" for 1948 was selected from the period 1946-1952; that for 1968 from 1964-1970; and that for 1970 from 1966-1970.

⁴¹ The concept is developed and explicated by Philip E. Converse in "The Concept of a Normal Vote," in

have been elected, even in a special election. Once ascertained that the candidate meets the criterion set forth here, the variable I is set equal to 1; if the candidate is not the incumbent, $I=0$.

The "national tides" variable must be chosen to reflect the way a given state has responded to the general trend in the nation. Therefore, the "tide" for a particular party in a particular year in a given state is measured by the percentage of the votes received by that party's House candidates in the present election year minus the percentage received the immediately preceding election year.

The idiosyncratic factors are not measured directly. They are estimated with the constant term (the intercept) of the equation which results from directly estimating the rest of the parameters of the model through regression.

In using these variables to estimate the parameters of the model through multiple regression, we separate by party and by year.⁴⁴ That is, there are separate estimates of the relative importance of the phenomena contained in the theory for each party and for each election year from 1948 to 1970—twenty-four sets of estimates in all (two parties times twelve election years).

An overall model for each Senate "class" was also estimated, separating by party as before. In other words, all the Democratic party election data for each year from 1948 to 1952 were collected into one set in order to get one (slightly more stable, there being more observations) estimate, and the same was done for the Republicans. The procedure was repeated for each subsequent six-year sequence. The obvious rationale here is that in each six-year period all Senate seats will have been contested once and only once in a general election. Each period is designated as follows: Group 1, 1948–1952; Group 2, 1954–1958; Group 3, 1960–1964; and Group 4, 1966–1970. Let us now turn to the analysis of these estimates.

Results and Analysis: Grouped Data. The main focus in this analysis is on (1) the relationship between party and incumbency in Senate elections both within and between the two major political parties, and (2) changes in those rela-

tionships during the postwar period. The primary purpose of the "tides" variable is to remove certain confounding elements from the relationship between the two phenomena of central interest. Thus, although we will report its values and discuss its interpretation in the hypothetical data example below, it should be considered, for the most part, a "control variable," whose function is to control for otherwise distorting effects.

The results of the multiple regression on the grouped data are reported in Table 7. Both the actual parameter estimates (including the constant term) and the standardized regression coefficients, or beta-weights, are presented. I will employ the former to illustrate the use of these results as actual prediction equations. However, because the variables have somewhat different distributions between parties in a given election year (or Group), and even more varied distributions over time, the similarities and contrasts between the parties and over time will be analyzed in terms of the standardized coefficients.

Let us first describe the use of these equations in a hypothetical prediction situation. Recall that the model is

$$[(9) \text{ repeated}] \quad S = a(P) + b(I) + c(T) + Id,$$

where a , b , and c have now been estimated from data by multivariate statistical techniques. When the estimates for Group 3 (1960–64) are used, for example, the model for the Democrats reads

$$(10) \quad \hat{S} = 0.54(P) + 0.09(I) + 0.50(T) + 0.23,$$

and for the Republicans it reads

$$(11) \quad \hat{S} = 0.40(P) + 0.10(I) + 0.58(T) + 0.26,$$

where S , P , T , and Id (the constant term) are expressed in proportions, not percentages. If in 1964 the "base party vote" for the Democrats in a given state was 0.485 (i.e., 48.5 per cent) and the Democratic "national tide" in that state that year was +0.05, we would "predict" that a Democratic senatorial candidate who was the incumbent ($I = 1$) would receive

$$(12) \quad 0.607 = 0.54(0.485) + 0.09(1) + 0.50(+0.05) + 0.23,$$

or 60.7 per cent of the vote. Note that being an incumbent was "worth" nine per cent.

If in the same state that year the Republican "base party vote" was 0.475 (suggesting that the two parties were highly competitive), the

⁴⁴ Uncontested Senate elections were omitted from the analysis. Cases where the Representatives from a state were unopposed eliminated that state from the analysis for that year (i.e., the "tides" variable was considered to have a missing value for that year, which required deletion of the entire state). Such an occurrence was quite infrequent. All statistical computations were carried out on Washington University's IBM 360/50 via the *Statistical Package for the Social Sciences* (SPSS) routines.

Table 7. Multiple Regression Estimates of the Effects of Party, Incumbency, "National Tides," and Idiosyncratic Factors on Senate Elections, Grouped Data: 1948-1970

Years	Democrats							
	Parameters				Beta-Weights			$R^2(\%)$
	Party	Incumbency	Tides	Constant	Party	Incumbency	Tides	
1948-52 (1) ^a	.72 (.07) ^b	.044 (.02)	.62 (.11)	.16	.71	.19	.36	70.2
1954-58 (2)	.66 (.09)	.07 (.02)	.36 (.12)	.19	.61	.36	.22	67.2
1960-64 (3)	.54 (.11)	.09 (.02)	.50 (.13)	.23	.39	.45	.31	57.6
1966-70 (4)	.10 (.12)	.12 (.02)	.29 (.14)	.40	.08	.58	.19	50.2

Years	Republicans							
	Parameters				Beta-Weights			$R^2(\%)$
	Party	Incumbency	Tides	Constant	Party	Incumbency	Tides	
1948-52 (1)	.71 (.08)	.01 (.02)	.46 (.12)	.17	.72	.07	.28	62.7
1954-58 (2)	.58 (.10)	.06 (.02)	.17 (.14)	.19	.53	.31	.10	49.4
1960-64 (3)	.40 (.09)	.10 (.02)	.58 (.12)	.26	.34	.51	.36	61.6
1966-70 (4)	.15 (.11)	.11 (.02)	.40 (.13)	.39	.12	.50	.27	43.3

^a Data are grouped into "classes" of three consecutive election years. Number in parentheses denotes the Group or "class."

^b Standard error of the parameter.

senatorial candidate was not, of course, the incumbent ($I = 0$), and the Republican "national tide" was equal in size but opposite in sign to the Democratic (i.e., -0.05). the model "predicts" for that candidate

$$(13) \quad 0.421 = 0.40(0.475) + 0.10(0) + 0.58(-0.05) + 0.26,$$

or 42.1 per cent. Note that if the Republican were the incumbent instead of the Democrat, we would predict victory for the GOP candidate. Also, observe that party and incumbency, when both are present (i.e., $I=1$), are more substantial sources of support than are the idiosyncratic factors represented by the constant term. Finally, notice that if neither candidate was the incumbent, the Democrat would still win, but with slightly more than a majority of the total vote.

One of the reasons the Group 3 results were selected to exemplify the use of the models as prediction equations—and to illustrate thereby the substantive interpretation of the theory underlying the model—is that the parameters are all very stable. By this is meant that the coefficients are all more than twice the size of their standard errors. In terms of "statistical significance," this means that we can reject in each case the null hypothesis (i.e., that there is no linear relationship between the independent variable and the proportion of votes received by the senatorial candidates) with less than a five per cent chance of error. But a "statistical significance" interpretation is not strictly applicable here for it is a population that is involved rather than a sample, namely, the universe of all Senate elections from 1948 to 1970. Nevertheless, the relationship between the size of the

coefficients and their standard errors does give some indication both of the basic stability of the estimates and of the extent to which there is in fact a non-zero relationship between each independent variable and the dependent variable. Consequently, the results will be discussed in this light.

In only two instances is a parameter patently indistinguishable from zero, that is, in only two instances is the standard error *larger* than the coefficient itself. These occur with the Group 4 Democratic estimate of the effect of party, and the Group 1 Republican estimate of the effect of incumbency. As shall be seen, neither case causes any real problem of substantive interpretation, since the actual estimate of these effects should be nearly zero anyway.

Two other estimates, both in Republican "Classes," are somewhat unstable, viz., the Group 4 party coefficient and the Group 2 "tides" coefficient. These are only "somewhat unstable" because although the coefficient is not twice the size of its standard error, it is still the larger of the two. Fortunately, the party coefficient again causes no real problem substantively, as will become evident below. Nevertheless, the small size and relative instability of the Republican "tide" is curious given what we know about 1958. Yet since its function is that of a control variable, we need not concern ourselves here with its behavior.

Turning to the first of the two substantive questions at hand, examination of the beta-weights reveals no particularly outstanding incongruity *between parties* in the relative importance attaching to the various factors in each Group. The only relatively consistent difference between the party models is the greater amount of variance explained (R^2) for the Democrats than for the Republicans.⁴⁵

Far more interesting, though, is the response provided by the models to the second question of central concern: What has been the direction and magnitude of the *change* in the relative importance of party and incumbency, for both political parties, in Senate elections of the postwar period? The answer, shown schematically

in Figures 4 and 5, is as dramatic as it is unequivocal: The importance of party has undergone a sharp, secular decline, while the importance of incumbency has experienced an almost commensurate increase. There are only two notable differences between the parties. For one, the magnitude of the predominance of incumbency over party for the Republican "Class" of 1960-1964 is almost three times that for the Democrats, although the direction of the difference is the same in both cases. Second, while the *decline* of party is unquestionably monotonic and nearly linear for both parties, the *increase* in the importance of incumbency continues unabated over the whole period only for the Democrats; the increase for the Republicans, more rapid during the first dozen years, levels off for the last three elections.

Inspection of the "constant" term and the R^2 column of Table 7 shows them to be consistent with the theoretical and substantive implications of these patterns. As party has decreased in influence, and incumbency has taken up part, but not all, of the "slack," the role of idiosyncratic factors in Senate elections has steadily grown. Examination of the R^2 column of the same Table bears this out since, for the Democrats especially but for the Republicans as well, the ability to predict by relying on the two principal systematic factors (plus "national tides") has been appreciably reduced. The difference for both parties between the amount of variance explained by the models in the early part of the postwar period (1948-1952) and the amount explained in the last part (1966-1970) is approximately 20 per cent. The variance explained is still quite high, to be sure, but the drop is nonetheless considerable.

Analysis of Results: Ungrouped Data. The same general conclusions can be drawn from an analysis of the ungrouped, election year-by-election year data. The parameter and beta-weight estimates for each party are recorded in Table 8, with the values of the standardized regression coefficients for party and incumbency depicted in Figures 6 and 7. Once again there is a marked overall decline in the relative importance of party, and a concomitant increase in the relative importance of incumbency. Setting 1956 aside as a "deviant case" for the Republicans would accentuate the steadiness of these trends, while doing the same with 1958 for the Democrats would have a similar effect. In addition, the constant term and R^2 values follow the expected pattern. The influence of idiosyncratic factors has increased by an average of roughly one per cent each biennial election, and the amount of variance explained has

⁴⁵ Yet this should not lead us to conclude that the parties are in any important sense "the same," for the similarity may very well be due mainly to the nature of the variables employed. The Republican S-values are almost always complements of the Democratic S-values. Although the P-values for the two parties are certainly not linear transformations of each other, there is nonetheless enough of an inverse relationship between them (and between the incumbency variables for the two parties) to make the similarity in behavior of the separate party equations as much of a technical expectation as of a substantive finding. I am grateful to an anonymous referee for this observation.

Figure 4. Multiple Regression Estimates of the Effects of Party and Incumbency on Senate Elections, from a Model Employing "National Tides" as a Control Variable: Data Grouped into "Classes" of Three Consecutive Election Years Each: Standardized Regression Coefficients: Democrats, 1948-1970

fallen by a total of almost 40 per cent during the quarter-century covered by the analysis, a drop twice the size encountered in the grouped data.

Still, it must be admitted that the ungrouped data reveal somewhat more complex phenomena at work than do the grouped data. Either set of data permits us to assert the clear predominance of party in Senate elections during the period 1948-1952; the ungrouped data extend that conclusion to 1954 for the Republicans, to 1956 for the Democrats. Thereafter, however, the interpretations based on the grouped data require at least three important qualifications: (1) While the overall decline in the importance of party did continue over the entire period for both parties, the Republican decline from the late 'fifties onward certainly lacks the urgency suggested by the grouped data results (cf. Figure 5). (2) For both parties,

incumbency has *not* shown a strong *consistent* increase in importance from the late 'fifties onward. This finding was already apparent for the Republicans from an analysis of the grouped data, but constitutes a modification of the conclusion of the earlier analysis regarding the Democrats. Although both sets of results attach greater contemporary importance to incumbency than to party for Democratic senatorial candidates, the ungrouped data suggest that this is due less to the continued overall increase in the incumbency trend reported in Figure 5 and more to the continued overall decline in the party trend. (3) The general pattern of the late 'fifties and the subsequent decade is one of fluctuation in relative importance from election to election, rather than the persistent dominance of either incumbency or party. In fact, in many elections it is impossible to determine whether one factor really exerted more influ-

^a Number in parentheses is the standard error of the coefficient.

Figure 6. Multiple Regression Estimates of the Effects of Party and Incumbency on Senate Elections in Each Election Year from 1948 through 1970: Standardized Regression Coefficients from a Model Employing "National Tides" as a Control Variable: Democrats

ence than the other because the difference between them is so small. This difficulty is attenuated in 1962 and 1966 for the Democrats, and in 1966 for the GOP, but remains for the other years.

The stability of the estimates based on the ungrouped data is not as adversely affected by the reduction in the number of observations as might have been expected. The exception is the "tides" variable, for which the standard error is larger than the coefficient 8 out of 24 times. But, as noted before, this need not concern us, given the function the variable serves.

Such great instability occurs only three times for the incumbency variable, and only once for party. The instability of the incumbency variable causes no theoretical problems since it happens early in the period; even the very stable estimates of the influence of incumbency during those election years are very small. The standard error, however, is vexingly large for the party coefficient in 1956, near the middle of

the election series. But even here the substantive interpretation is a plausible one. We know that the outpouring of support for Eisenhower was far from a strict "party vote"; that is, many non-Republicans voted for the President's reelection. Although Eisenhower's "coattails" were not considered particularly long that year, the size of the "tides" component in our model (fourth-largest in the entire Republican series) indicates that they did in fact have some effect on the Senate elections. Many of those who voted for Eisenhower voted for the Republican candidate for the Senate as well. Nevertheless, the principal influence on the electoral support given Republican senatorial candidates that year was the congeries of idiosyncratic elements discussed previously. They probably were able to come into play, of course, partly because of the "loosening" effect of the strong "presidential tide." The only other times the standard error of the party coefficient approaches the size of the coefficient itself are

Source: Table 8.

Figure 7. Multiple Regression Estimates of the Effects of Party and Incumbency on Senate Elections in Each Election Year from 1948 through 1970: Standardized Regression Coefficients from a Model Employing "National Tides" as a Control Variable: Republicans

three instances in the late 1960s, again posing no real problem of interpretation, given the overall pattern.

Summary and Implications. The major finding is that the relative importance of party and incumbency in Senate elections has changed dramatically over the last quarter-century. Party has undergone an overall decline in influence, while incumbency has experienced a roughly proportionate increase. At the same time, the importance of idiosyncratic factors has grown. These patterns are virtually identical for both major political parties. Naturally, these trends have been accompanied by a substantial decrease in the (statistical) explanatory ability of the theory and models employed in the analysis.

These findings fit well with previous research documenting the present malaise in the capacity of "party" to structure both mass electoral behavior and congressional voting behavior.⁴⁶

⁴⁶ See, e.g., Gerald M. Pomper, Badi G. Foster, Charles E. Jacob, Wilson C. McWilliams, Alan Rosen-

Clearly a crucial linkage between electors and elected has been weakened. This study indicates, however, that incumbency now serves, at least in Senate contests, as an important alternate voting cue to party, thereby assuming some of the linkage function formerly performed by party. But the increase in the structuring role played by incumbency has not been sufficient to offset the substantial decline in party's ability to play that role. The consequence, of course, is a more tenuous, less regularized overall relationship between the voters and candidates for the U.S. Senate. This situation of relative disarray is reflected in the present analysis in the increased importance of idiosyncratic factors and in the decreased explanatory power of the models employed.

The implications of these findings for more general theories of American politics are wide-reaching and profound. For example, they ad-

thal, and Jay A. Sigler, *The Performance of American Government* (New York: The Free Press, 1972), pp. 81-86.

dress quite directly the ongoing debate over the existence of recurring periods of "critical realignment" in American electoral history.⁴⁷ Some scholars have argued that the United States is presently in the midst of such a realignment sequence. While the results of the present study do not necessarily contradict such an interpretation, they do disagree with certain areas of the argument. One such area involves the timing of the decline in the relative power of party to influence electoral behavior. Some studies date a precipitate drop in the power of party as recently as the mid-1960s, citing, among other things, the sharp increase at that time in the proportion of those who identify

themselves as "independents."⁴⁸ While such evidence is highly suggestive, the present data strongly suggest that, at least in Senate elections, the decline has been far more steady and long-term. Indeed, the effect of party has been muted during the entire postwar period. Thus, at the very least, this finding would seem to demand a fresh look at the subpresidential manifestations of such realignment phenomena.

These findings have implications as well for a number of fundamental problems of democratic theory. For example, the switch in the relative strengths of party and incumbency in influencing Senate elections bears on basic questions of the representativeness and responsiveness of American democratic institutions. For if "party" is no longer the controlling force it once was in determining electoral outcomes, and if representatives are more beholden to incumbency for their success at re-election, then new definitions of the relationship between voters and elected officials may be required. The nature and quality of the electoral and policy linkage provided by each of these two phenomena, party and incumbency, obviously demand careful, sustained attention.

⁴⁷ The most notable exponent of such an interpretation is Walter Dean Burnham. See his "The Changing Shape of the American Political Universe," *American Political Science Review*, 59 (March, 1965), 7-28, and his more recent and comprehensive *Critical Elections and the Mainsprings of American Politics* (New York: W. W. Norton, 1970). The concept of a "critical election" was first given academic sanction in V. O. Key, Jr., "A Theory of Critical Elections," *Journal of Politics*, 17 (February, 1955), 3-18. Also pertinent are E. E. Schattschneider, *The Semi-Sovereign People* (New York: Holt, Rinehart, and Winston, 1960); Gerald M. Pomper, *Elections in America* (New York: Dodd, Mead and Company, 1968); *The American Party Systems*, ed. William Nisbet Chambers and Walter Dean Burnham (New York: Oxford University Press, 1967); among others.

⁴⁸ See, e.g., Burnham, *Critical Elections*. Erikson also sees the mid-1960s as significant. See his "Malapportionment, Gerrymandering, and Party Fortunes in Congressional Elections," at pp. 1240 ff.

The Paradox of Vote Trading*

WILLIAM H. RIKER

University of Rochester

AND

STEVEN J. BRAMS

New York University

The conventional judgment on vote trading in legislatures is one of severe disapproval. In the United States, at least, the usual idiom is "logrolling" and this word has always had pejorative connotations.¹ The commonsense of the language has been reinforced by the judgment of scholars. Schattschneider, whose study of the writing of the Smoot-Hawley Tariff of 1930 is the most detailed examination of a single event of vote trading, concluded his book with the remark: "To manage pressures [i.e., for vote trading] is to govern; to let pressures run wild is to abdicate."² Furthermore, it seems likely that the widespread scholarly support for concentrated national leadership—as embodied, for example, in such writings as the report of the Committee on Political Parties of the American Political Science Association, a report to which Schattschneider contributed substan-

tially—was engendered in part at least by a desire to minimize vote trading.³

Despite the long-standing unanimity of scholarly and popular judgment, however, it has recently been argued by a number of scholars that vote trading is socially desirable because it allows the expression of degrees of intensity of preference. Buchanan and Tullock argue that the voter or legislator can improve his welfare "if he accepts a decision contrary to his desire in an area where his preferences are weak in exchange for a decision in his favor in an area where his feelings are stronger." Hence they say: "Bargains among voters can, therefore, be mutually beneficial."⁴ The authors recognize that, when bargains are concluded "in which the single voter does not participate, . . . he will have to bear part of the costs of action taken."⁵ But they nevertheless conclude that these external costs are on the average less than the benefits obtained so that for the society as a whole vote trading or logrolling is a desirable kind of event.

Following this argument there has developed a small literature on the subject that interprets the market for votes as if it were a market for goods. Tullock has elaborated his earlier position.⁶ Coleman has argued that logrolling is a device both to avoid Arrow paradoxes and to arrive at optimal allocations.⁷ A number of writers have pointed out, however, that vote trading does not eliminate these paradoxes.⁸ But these same writers

* An earlier version of this paper by the senior author was originally presented at the Annual Meeting of the American Political Science Association, Washington, D.C., September 5-9, 1972.

¹ *A Dictionary of Americanisms* (1951), which is probably the most authoritative collection, cites many political examples from 1812 (Ninian Edwards) to 1949 (*Time* magazine), in every one of which the word is clearly used in a pejorative sense. In the quotation from Edwards, logrolling is specifically identified with intrigue; and the climate of intrigue is conveyed by almost all the later quotations. The Oxford Dictionary (i.e., *A New English Dictionary on Historical Principles*) cites political usage from both sides of the Atlantic from 1823 (*Niles Weekly*) on to the end of the century, and its quotations also are uniformly pejorative. Bartlett's *Dictionary of Americanisms* (1859) contains a lengthy and righteously indignant explication of the political sense of "logrolling." None of these sources indicate any pejorative connotation at all for the word when it refers to clearing land or building houses. It must have acquired the sense of intrigue, therefore, only when it was transferred from the bartering of labor to the bartering of votes. And this demonstrates that the bartering of votes has regularly been socially disapproved.

² E. E. Schattschneider, *Politics, Pressures and the Tariff* (New Jersey: Prentice-Hall, 1935), p. 293. Schattschneider interpreted the process of tariff writing as an "attempt to set up a beneficently discriminatory set of privileges"—beneficent in the sense that a few particular industries deemed worthy would benefit. This attempt failed, he argued, because the legislation as actually written protected so "indiscriminately . . . as to destroy the logic and sense of the policy" (p. 283). One of the purposes of this essay is to explain the conditions for such failure.

⁴ James Buchanan and Gordon Tullock, *The Calculus of Consent* (Ann Arbor: University of Michigan Press, 1962), p. 145.

⁵ *Ibid.*

⁶ Gordon Tullock, "A Simple Algebraic Logrolling Model," *American Economic Review*, vol. 60 (June, 1970), pp. 419-26.

⁷ James Coleman, "The Possibility of a Social Welfare Function," *American Economic Review*, vol. 56 (December, 1966), 1105-22.

⁸ Dennis C. Mueller, "The Possibility of a Social Welfare Function: Comment," *American Economic Review*, vol. 57 (December, 1957), 1304-11; and, in an especially lucid and compelling argument, Robert Wilson, "An Axiomatic Model of Logrolling," *American Economic Review*, vol. 59 (June, 1969), 331-41, shows that, except in one unlikely circumstance, logroll-

and others have taken pains to argue that it does improve allocations in the direction of Pareto optimality.⁹

We have thus an intellectual confrontation between an older (and popular) tradition and new developments in social science. In this essay, we intend to reconcile the conflict. We will show (1) that logrolling itself (as if in a legislative market for votes) does in fact improve the position of the traders; but (2) we will show also that this very improvement generates external costs for the non-traders—costs that may be—and probably sometimes are—of such magnitude that they generate a paradox of vote trading. This paradox has the property that, while each trade is individually advantageous to the traders, the sum of the trades is disadvantageous to everybody, including the traders themselves. Furthermore, since trading is individually rational, this paradox is inescapable, given an appropriate distribution of taste. Even if the original trades are not considered binding so that traders can try to extricate themselves from the paradox, they may make new trades which result in an indefinite cycle of return to the original position, return to the paradox, etc. Nor can this lack of a stable equilibrium be compensated for by the formation of coalitions. So truly the paradox, once generated, is inescapable. In general, therefore, the market for legislative votes is quite different from the market for private goods and it is not wise to draw analogies from one market to the other.

A Model of Vote Trading

In order to analyze some of the essential features of vote trading, it is useful to establish an abstract legislature consisting of the set N of members, $N = \{1, 2, \dots, n\}$. This legislature deals with motions, x, y, \dots , which are proposals to impose commands. The set of motions, A , is indefinitely large, $A = \{x, y, \dots\}$. If a motion, x , is adopted, then an associated outcome, X , exists, and X is the state of affairs in which the command in x is imposed. If, however, a motion, x , is rejected, then the associated outcome \bar{X} exists, and \bar{X} is similar to the status quo ante except that it contains the memory of the decision not to impose the command in x . Hence, associated with the set of motions, A , is a set of possible outcomes, O , which is twice the size of A and is also indefinitely large, $O = \{X, \bar{X}, Y, \bar{Y}, \dots\}$.

ing necessarily involves a violation of Arrow's condition of independence from irrelevant alternatives.

⁹ See Wilson, *op. cit.*; Edwin T. Haeffle, "Coalitions, Minority Representation, and Vote-Trading Probabilities," *Public Choice*, vol. 8 (Spring, 1970), 75-90; and Dennis C. Mueller, Geoffrey C. Philpotts, and Jaroslav Vanek, "The Social Gains from Exchanging Votes: A Simulation Approach," *Public Choice*, vol. 13 (Fall, 1972), 55-79.

In this abstract legislature, motions are made and voted upon serially, so that future motions are not necessarily anticipated when current motions are considered. Note that this assumption about the system is markedly different from the assumption made in the essays cited in notes 8 and 9, where it is typically laid down that all motions are simultaneously before the legislature. In such a system support can be traded back and forth in all possible ways, but in the present system support can be traded only with respect to the subset of A currently before the legislature or anticipated to come before it. The rationale for this more restrictive assumption is simply that it accords with a crucial feature of the real world. In the third section, however, we remove this restriction only to find that it makes no theoretical difference, although it may make a practical difference.

The legislators produce outcomes from motions by voting, where votes are defined thus:

$v_i(x) = 1$ is a vote cast yea by member i on motion x
 $v_i(x) = -1$ is a vote cast nay
 $v_i(x) = 0$ is a vote not cast (i.e., an abstention)

The rule connecting motions to outcomes is the usual one of simple majorities:

if $\sum_{i=1}^n v_i(x) > 0$, then X exists

if $\sum_{i=1}^n v_i(x) \leq 0$, then \bar{X} exists.

The members of N order the elements of the set O by a relation, R , which is connected, transitive, and reflexive.¹⁰ The relation, R , may be thought of as a combination of the relation of preference, P , and of indifference, I . The member, i , who holds the relation is, if necessary, identified by a subscript, R_i . The entire set O may be ordered by R and from that ordering cardinal utility numbers, $u_i(X)$, can be derived. Finally, it is assumed that the people in N are rational in the sense that they act to maximize utility or, if appropriate, expected utility.

It is important to note that utility is defined over outcomes, which are the goals themselves, not over motions, which are merely the means to the goals. While it is probably the case that most people care about the alternative goals rather than the means, the use of goals in the definition is not

¹⁰ To say R is connected means that either XRY or YRX is true; to say R is transitive means it is true that if XRY and YRZ , then XRZ ; to say R is reflexive means that it is true that XXR .

the consequence of a passion for realism. Instead utility is defined over goals in order to allow for voting against motions that lead to the achievement of one's immediate interest—which is the essence of logrolling. Suppose utility were in fact defined over motions, i.e., $u_i(x)$, rather than $u_i(X)$. Then if $u_i(x) > u_i(\tilde{x})$, it would necessarily and invariably be that, among rational actors, $v_i(x) = 1$. That is, if the goal itself were the motion, then one would always have to vote in accordance with one's true tastes. But if the motions are merely means, then it is conceivable that, even though $u_i(X) > u_i(\tilde{X})$, still $v_i(x) = -1$ because member i is achieving some other goal by devious means. In short, defining utility over outcomes rather than motions allows for the possibility of devious behavior such as is often involved in vote trading.

Without, we hope, a loss of generality, it is from now on assumed that all members of N are concerned about motions and that, as between X and \tilde{X} , either $XP_i\tilde{X}$ or $\tilde{X}P_iX$. There is not much loss of realism in this assumption if we think of real legislatures as varying in size from decision to decision according to the number of legislators who take part in them.

There is a set $S(x)$ and its complement $-S(x)$ which are pairwise disjoint subsets of N so that $S(x) \cup -S(x) = N$ and $S(x) \cap -S(x) = \emptyset$; where \emptyset is the empty set. $S(x)$ has s members and $-S(x)$ has $(n-s)$ members; and $n < 2s$ so that $S(x)$ is always larger than $-S(x)$. The defining property of $S(x)$ is that all the members of S have the same preference between X and \tilde{X} and all the members of $-S(x)$ have the opposite preference. That is, if $i, i \in S(x)$, has $XP_i\tilde{X}$, then $j, j \neq i$ and $j \in S(x)$, also has $XP_j\tilde{X}$ and $k, k \in -S(x)$, has $\tilde{X}P_kX$; while, if i has $\tilde{X}P_iX$, then j has $\tilde{X}P_jX$ and k has $XP_k\tilde{X}$. Thus $S(x)$ and $-S(x)$ may be thought of as the majority and minority that would exist on motion x if everybody who preferred X to \tilde{X} voted yea on x and everybody who preferred \tilde{X} to X voted nay on x .

There is in addition a set $T(x)$ and its complement $-T(x)$ which are also pairwise disjoint subsets of N so that $T(x) \cup -T(x) = N$ and $T(x) \cap -T(x) = \emptyset$. $T(x)$ has t members and $-T(x)$ has $n-t$ members; and, again, $n < 2t$ so that $T(x)$ is always larger than $-T(x)$. The defining property of $T(x)$ is that all members of T vote the same way on x and all members of $-T$ vote the opposite way. That is, if $v_i(x) = 1$, then for all $j, j \neq i, j \in T(x)$, $v_j(x) = 1$ and for all $k, k \in -T(x)$, $v_k(x) = -1$, while if $v_i(x) = -1$, then $v_j(x) = -1$ and $v_k(x) = 1$. Thus, $T(x)$ and $-T(x)$ are the actual majority and minority on a vote on motion x .

If a voter i always voted for x when $XP_i\tilde{X}$ and against x when $\tilde{X}P_iX$, then $S(x)$ and $T(x)$ would be identical. This is what is known as "voting in accord with one's true tastes" or "sincere" voting.

It might just as reasonably be called naive.¹¹ Regardless of name, sincere or naive voting is to be contrasted with sophisticated voting, which is defined as voting against one's immediate interest when there is an incentive to do so. That is, if $u_i(Y) > u_i(X)$ and $u_i(X) > u_i(\tilde{X})$ and if i can achieve Y by voting against x , then $v_i(x) = -1$ is sophisticated voting. There are several reasons why one might choose to do so (e.g., to exploit the fact of a voting paradox), some of which are analyzed by Black and Farquharson. Surely the main reason for sophisticated voting is logrolling and this is what will be analyzed here.

To vote sophisticatedly is to switch sides between $S(x)$ and $T(x)$. If one is in $S(x)$ and orders $XP_i\tilde{X}$, to switch is to resign from the set $S(x)$ and join $-S(x)$ where one acts as if one orders $\tilde{X}P_iX$. Hence for some i_0 , who is a particular member of $S(x)$, switching is:

$$\begin{aligned} &S(x) - \{i_0\} \\ &-S(x) + \{i_0\}. \end{aligned}$$

Of course, i_0 may be any number of persons, but for convenience the symbol is treated as if it represented a single person.

Under what conditions might switching be expected to occur? Surely one necessary condition is that the switcher belong to $S(x)$. The motive for switching is to bring about a result different from that which would occur if voting were sincere. Assume that some i_0 switches from $-S(x)$ to $S(x)$, then the result is unchanged. The preferred outcome of the members of $S(x)$ was the winner before the switch and remains so after it. If, however, i_0 (hereafter identified simply as " i ") without the particularizing subscript) switches from $S(x)$ to $-S(x)$, it may be that the preferred outcome of the members of $S(x)$ loses. Hence the only chance that a member has to change the outcome is when he belongs to the initial majority or to the majority under sincere voting. The first condition for switching is, for the switcher, i , that:

$$i \in S(x). \quad (1)$$

Elaborating the same notion, the switcher actually changes the outcome only if he is a pivot, only if, that is, his switching renders the initial winner a loser and the initial loser a winner. This condition can be expressed in a stronger way: In order to justify switching, the switcher must be

¹¹ Duncan Black, *The Theory of Committees and Elections* (Cambridge, Cambridge University Press, 1958), p. 44, uses the former phrase and Robin Farquharson, *Theory of Voting* (New Haven, Yale, 1970), pp. 17-18, uses the latter. Voting in accord with one's true tastes (defined over motions) seems "sincere." But if utility is defined over outcomes, it seems merely naive to confuse means and ends.

compensated by a specifiable amount. (If he switches without any compensation for his act of giving up his position on the side he himself favors, his behavior must be regarded as truly irrational and self-destructive.) Since, for the switcher, $u_i(X) > u_i(\bar{X})$ while he votes $v_i(x) = -1$ or $u_i(\bar{X}) > u_i(X)$ while he votes $v_i(x) = 1$, his vote costs him the absolute value of $|u_i(X) - u_i(\bar{X})|$. To induce him to bear that cost, there must be available in the system an amount b that is larger than the cost:

$$b > |u_i(X) - u_i(\bar{X})|.$$

The only way b can come into existence is that some event happen by the switcher's action to generate b . If nothing happens by the switch, that is, if the preference of the members of $S(x)$ is the preference of the members of $T(x)$, then no change occurs and b is not generated. Since no one gains, no one has a motive to compensate the switcher for switching. So, if the switcher is to be paid, the outcome must be changed, i.e., the switcher must be the pivot. Hence we have the second condition:

$$S(x) - \{i\} = -T(x) \quad (2)$$

Having defined switching, we now define vote-trading, which is a barter system of switching. A trade between $i \in N$ and $j \in N$ occurs when i switches on x and j switches on y in such a way that, though i loses from his switch, he gains from j 's, and, though j loses from his switch, he gains from i 's. The conditions for a trade are now specified.

Let $i, i \in S(x)$, order $XP_i\bar{X}$. Let i switch (i.e., $-S(x) + \{i\} = T(x)$), so that the members of $T(x)$ bring about X as the chosen state of affairs. Of course, i loses something thereby; and, in order to compensate i , someone else must gain. Let the gainer be $j, j \in -S(x)$, so that $\bar{X}P_jX$. By reason of i 's switch, j has obtained his preferred state of affairs despite his bleak initial expectations. Thus, i has a loss, j has a gain, and j in a sense owes i a debt.

If this were a system of exchange in which participants paid for services with some numeraire, like money or jobs, then j might simply pay i at least the amount b . But since in fact it is a system of barter, j must pay i with a switched vote. For j to switch on motion y , it must be by (1) that j belongs to $S(y)$. Let j order $YP_j\bar{Y}$ so that by his switch he brings about \bar{Y} , which is what is desired by $i, i \in -S(y)$, who orders $\bar{Y}P_iY$. Thereby, i is compensated for his previous loss and j has discharged his debt on motion x by taking a loss on motion y . Summarizing, the first condition of vote trading then is:

$$\begin{aligned} i &\in S(x), & j &\in -S(x) \\ i &\in -S(y), & j &\in S(y) \end{aligned} \quad (3)$$

Simple as this condition is, it tells us quite a bit about the actual occurrence of logrolling in real legislatures. It is apparent that, for a trade to be possible, the traders must be on opposite sides on two motions. One trader must be in the initial majority on the first motion and the initial minority on the second. The other trader must be in the initial minority on the first motion and the initial majority on the second. If this condition cannot be met, then trading is not possible.

One obvious place it cannot be met is in legislatures with just two disciplined parties. To say a party is disciplined is to say that all its members are on the same side on any motion. Hence if the members of a party are a majority on one motion, they are a majority on all motions. For the condition to be met, some of those people must sometimes be in the minority, but they cannot by reason of the fact of discipline.

Consequently, in a legislature with just two disciplined parties, logrolling is extremely rare. This is probably one reason so many American writers from Woodrow Wilson onward have admired the British Parliament, especially when it has approached the two-party situation in which statement (3) cannot be satisfied. They should have also admired those state legislatures like New York and Pennsylvania which party bosses have usually run with an iron hand because logrolling is equally impossible in them. But it has never been fashionable to admire boss rule.

Of course, when vote trading is banished from the legislature, political compromise goes on someplace else politically antecedent to the legislature. Thus in state legislatures and city councils with disciplined parties, it is in the majority caucus or in the mind of the boss that the compromise takes place. In England, the Cabinet serves as one place of compromise and very probably something like vote trading goes on there. Since the Cabinet situation is unstructured in comparison with the Parliamentary situation, however, it is probably hard to identify the trades and compromises that do occur.

To approach the second condition for vote trading observe that, in the running example where $i, i \in S(x), i \in -S(y)$, orders $XP_i\bar{X}$ and $\bar{Y}P_iY$ while $j, j \in -S(x), j \in S(y)$, orders $\bar{X}P_jX$ and $YP_j\bar{Y}$, it is the case that i gives up winning on x in order to win on y . Assuming that the trader is rational in the sense that he seeks to maximize utility, then he gives up on x only for a utilitarian reason. It must be, therefore, that, if he trades, the trader finds the joint utility of losing on x and winning on y greater than the joint utility of winning on x and losing on y .

To express this a little more formally, one can write of the utility of a trader's preferred position on motion x , $u_i(P_x)$, and of his not preferred position, $u_i(\bar{P}_x)$. By statement (3) a pair of traders initially, without trading, obtain:

$$\begin{aligned} &\text{for } i, u_i(P_x) + u_i(\bar{P}_y) \\ &\text{for } j, u_j(\bar{P}_x) + u_j(P_y), \end{aligned}$$

where i initially belongs to $S(x)$ and $-S(y)$ and j initially belongs to $-S(x)$ and $S(y)$. By trading, however, they can obtain:

$$\begin{aligned} &\text{for } i, u_i(\bar{P}_x) + u_i(P_y) \\ &\text{for } j, u_j(P_x) + u_j(\bar{P}_y). \end{aligned}$$

For the trade to occur, it must be that the latter are, respectively, greater than the former:

$$\begin{aligned} u_i(\bar{P}_x) + u_i(P_y) &> u_i(P_x) + u_i(\bar{P}_y) \\ u_j(P_x) + u_j(\bar{P}_y) &> u_j(\bar{P}_x) + u_j(P_y) \end{aligned}$$

or, rearranging:

$$\begin{aligned} u_i(P_y) - u_i(\bar{P}_y) &> u_i(P_x) - u_i(\bar{P}_x) \\ u_j(P_x) - u_j(\bar{P}_x) &> u_j(P_y) - u_j(\bar{P}_y). \end{aligned} \quad (4)$$

If we define the salience, s , to a member, i , of a motion, x , as the absolute difference between his utility for his preferred position and the utility for his not preferred position, that is,

$$s_i(x) = |u_i(P_x) - u_i(\bar{P}_x)|$$

then we can express statement (4) easily in words: for a trader to trade, his salience must be higher on the motion on which his partner switches than it is on the motion on which he switches.

In Tables 1 and 2 is presented an instance of a three-member committee in which vote trading is possible between members 2 and 3. In that example, the arrangements in the first column are made to satisfy statement (3) that member 2 belongs to

$S(x)$ and $-S(y)$ and member 3 belongs to $-S(x)$ and $S(y)$. Ignoring for the moment member 1's utilities (except as his preference is necessary to provide an initial majority), we construct the tables with cardinal utility numbers satisfying both on the one hand a set of preferences ($XP_2\bar{X}$, $\bar{Y}P_2Y$, $\bar{X}P_3X$, $YP_3\bar{Y}$) and on the other hand the utility requirements of statement (4). Translating statement (4) into the example of Tables 1 and 2, one gets

$$\begin{aligned} u_2(\bar{Y}) - u_2(Y) &> u_2(\bar{X}) - u_2(X) \\ 3 - (-3) &\quad 1 - (-1) \end{aligned}$$

$$\begin{aligned} u_3(\bar{X}) - u_3(X) &> u_3(Y) - u_3(\bar{Y}). \\ 2 - (-4) &\quad 1 - (0) \end{aligned}$$

For comparison, in Tables 3 and 4 is presented an example that satisfies statement (3) but not statement (4). Again translating, one gets

$$\begin{aligned} u_2(\bar{Z}) - u_2(Z) &= u_2(W) - u_2(\bar{W}) \\ 1 - (-1) &\quad 1 - (-1) \end{aligned}$$

$$\begin{aligned} u_3(\bar{W}) - u_3(W) &= u_3(Z) - u_3(\bar{Z}). \\ 1 - (-1) &\quad 1 - (-1) \end{aligned}$$

And because these are equalities rather than inequalities, statement (4) is not satisfied. Presumably, 2 and 3 could not trade on motions w and z .

From these examples one can readily see the advantages of vote trading and easily understand why the notion of logrolling has been so attractive to scholars. There may be a clear gain from trade for both parties. In the example in Tables 1 and 2, member 2 gains four units of utility and member 3 gains five units.

Nevertheless there are some severe limitations. The possibilities of trading are quite restrictedly

Table 1				Table 2			
Motion x				Motion y			
	Preferred Outcome	$u(X)$	$u(\bar{X})$		Preferred Outcome	$u(Y)$	$u(\bar{Y})$
Member 1	X	—	—	Member 1	Y	—	—
Member 2	X	1	-1	Member 2	\bar{Y}	-3	3
Member 3	\bar{X}	-4	2	Member 3	Y	1	0

Table 3				Table 4			
Motion w				Motion z			
	Preferred Outcome	$u(W)$	$u(\bar{W})$		Preferred Outcome	$u(Z)$	$u(\bar{Z})$
Member 1	W	—	—	Member 1	Z	—	—
Member 2	W	1	-1	Member 2	\bar{Z}	-1	1
Member 3	\bar{W}	-1	1	Member 3	Z	1	-1

finite. By reason of statement (2), a switch is pointless unless the switcher is a pivot with respect to the initial distribution of preference. Consequently, we have a maximum limit on logrolling: Since it takes two pivotal members to trade, there can at most be as many trades as half the number of issues. In a temporal world, moreover, only a finite number of issues can be juggled at once. In a session of a typical national legislature, there are probably no more than, say, two thousand motions, which gives a theoretical maximum of one thousand trades. But of course, many issues are trivial so that no trade is worthwhile; many others come up for decision so quickly that the elaborate arrangements of logrolling are not possible; for many others it may be difficult for a member to discover another one with whom statement (4) can be satisfied; and, finally, since motions come up serially so that many future motions cannot be anticipated and so that past motions are irrevocably settled, only a small subset of motions is available for trading at any one moment. One suspects that the practical maximum of trades is at most one-tenth of the theoretical maximum. Consequently, in the typical legislature (with, say, one hundred members) in the typical session it may well be that the average member can expect to be involved in at most one trade.

Furthermore, while some members may get enormous gains from trade, such enormous gains may be rare. In this sense vote trading, subject as it is to severe temporal restrictions, is quite different from commodity trading which can go on forever. So while it is true that gains can be made from trade, it is doubtful that the size and frequency of such gains is as great as the exponents of logrolling have imagined. Nevertheless, so long as one considers only the utilities of the traders themselves, trading is, for certain, both individually and socially desirable.

The Paradox of Vote Trading

Unfortunately, even this moderated enthusiasm for logrolling may be misplaced because the admitted gains from trade may be wiped out by external costs. Indeed, it is quite possible to imagine a system in which everyone gains from individual trades—and so has a positive motive to logroll—and yet everyone also loses if all such trades are carried out. This is the paradox of logrolling, to the illustration of which we now turn.

External costs are those which one bears as a result of the actions of others. They are to be contrasted with internal costs which result from one's own action. The noise that comes from the pneumatic drill is an internal cost with respect to the driller because it is part of what he must suffer to earn his pay. But to the neighbor at the construction site, the noise is an external cost. He must

bear it not in order to get something else, but merely because he is there.

Debate is never ending about the existence of some external costs. (For example, does the noise of the drill really bother the neighbor, or does he see a chance, by complaining of noise, even though it does not bother him, to blackmail the contractor?) But it seems impossible to doubt the existence of external costs in vote trading. Consider the position of some member who is not a party to a trade: Since the trade brings about a different winner on a motion, the nontrader bears an external cost if he was originally in the majority or he receives an external gain if he was in the original minority. Thus, if members i and j trade on motions x and y , then if some other member k belongs to $S(x)$ and $S(y)$, k is forced by their action to belong to $-T(x)$ and $-T(y)$. Thus k suffers a loss of $|u(P_x) - u(\bar{P}_x)| + |u(P_y) - u(\bar{P}_y)|$ —all as a consequence of no action of his own. Indeed, member k is completely passive throughout the entire transaction, but his outcomes are reversed.

External costs have generally been ignored in the writings of those who extol the benefits of vote trading.¹² Yet they must by the nature of the case, i.e., by statement (2) on pivoting, be present. Since trading changes the outcomes, there must always be innocent bystanders who lose. Although the size of their losses depends on the salience of particular outcomes in particular cases, it is possible to show that in some particular cases suffering is general and universal, which is the paradox of logrolling.

Table 5 depicts a system of trades for a three member legislature: between members 2 and 3 on motions x and y , between members 1 and 2 on motions w and z , and between members 1 and 3 on motions t and v . (This is not the only possible set of trades—one might have members 2 and 3 trade on x and w , 1 and 2 on t and y , and 1 and 3 on v and z , and other less exhaustive combinations—but all other complete sets of trades share the paradoxical feature displayed for the trades in Table 5. We assume, however, that once a set of trades on particular issues is made, new trades cannot be made on these issues. This means that a trader may not cancel an old trade with a new one simply because he subsequently discovers that what was thought to be advantageous is no longer

¹² An exception is Coleman, p. 1121, where it is noted in passing that the inclusion of such costs requires a "much more extensive calculation" than offered in that essay. More recently Coleman has provided an explicit calculation that leads to the conclusion that vote trading is profitable only under conditions of "absolutely free and frictionless political exchange" that preclude arbitrary decision rules. James S. Coleman, "Beyond Pareto Optimality," in *Philosophy, Science, and Method*, ed. Sidney Morgenbesser, Patrick Suppes, and Morton White (New York, St. Martin's, 1969), pp. 415-39.

* Nontrader on pair of motions.

so. Such an assumption is realistic because most legislatures provide ways to render past votes irrevocable, which means completed or partially completed bargains cannot be undone. In the next section, however, we drop even this assumption and show that the paradox persists even with unrestricted trading.) We have worked out examples similar to those of Table 5 for a five-member legislature, but they are too lengthy for inclusion here. Doubtless similar examples could be worked out for legislatures of any size. The three-member example can, of course, be embedded in any legislature; and, of course, the three members can be three factions.

It is quickly apparent that, if no trading occurs, the members neither gain nor lose from the passage of the six motions imagined for Table 5. The calculation is set forth in Table 6, where the several columns are a simple reproduction of columns 3 and 5 of Table 5—since in that Table all motions pass under sincere or naive voting. In Table 6 in the summary column on the extreme right, each member earns a net utility of zero as a result of the six votes.

Suppose, now, that the members, starting from

this base point of zero, calculate what they may expect to make from the trades in which they can engage. Each member sees that he can make two trades and increase his utility thereby. For the third pair of motions he can do nothing and might reasonably expect, though his expectation is in fact unrealizable, that he will receive his nontrading outcome on these motions. His expectations are, therefore, set forth in Table 7. If the member so calculates, it is clearly advantageous to trade whenever possible. When each does so, each generates a clear gain of four units of utility. From the point of view of the member, by taking these actions he increases his expected utility—which is the essence of rational behavior.

Unfortunately, however, if each member behaves rationally by making the trades possible for him, all the members suffer. They are, in fact, worse off than if they had voted sincerely or naively. The calculation is set forth in Table 8, where it is shown that each member receives a negative two units when all trades are made and external costs are taken into the reckoning.

This is the paradox of logrolling: that rational trades by all members make everyone worse off.

Table 6. Utilities of Outcomes Without Trades (Sincere Voting)

Table 8. Utilities of Outcomes with Trades and with External Costs

Members	Outcomes						Σu_i
	$u_i(X)$	$u_i(Y)$	$u_i(W)$	$u_i(Z)$	$u_i(T)$	$u_i(V)$	
1	-2	-2	-1	2	2	-1	-2
2	-1	2	2	-1	-2	-2	-2
3	2	-1	-2	-2	-1	2	-2

It is not easy to extricate oneself from this paradox. For example, it might be said that if members were foresighted they would refuse to make trades at all, lest the trades lead to the realization of the paradox. Self-restraint is not so easy to achieve, however. Suppose each member makes no trade himself but anticipates a trade among the pair that does not include him. That is, he himself behaves with self-restraint; but, with a conservative appreciation of what others can do to harm him, he anticipates the worst from them. This expectation, which is analogous to the notion of a security level in the theory of games, is calculated for each of the members in Table 9. It is immediately apparent that this is the worst that can happen to any member, for each loses six units of utility.

If each member perceives that his security level (Table 9) without trading is -6, then the -2 from systematic trading (Table 8) looks pretty attractive. It looks even more attractive if one suspects for a moment that the members of the pair from which one is excluded will in fact trade. Then one's only protection is to trade oneself as much as possible. This then guarantees a minimum loss of -2.

Conceivably the members might escape the paradox by agreeing to vote sincerely. But, if any

member suspects that others may not abide by their promises, then the best strategy is to trade oneself. In this way it is rational to trade not only to try to achieve the maximally good results (of Table 7) but also to avoid the minimal results (of Table 9) by arriving at modest losses (in Table 8). Thus, each member must trade in order to behave rationally; but then, perversely, each member comes to a worse end than if he abstained from trades and always voted sincerely or naively. The paradox is inescapable—in fact it is a kind of n -person Prisoners' Dilemma as depicted in Table 10.

Some Conditions of the Paradox

This paradoxical result is not an accidental consequence of the particular cardinal utilities nor of the particular choices of trades to be made. Rather the paradox persists even if one uses ordinal utility and allows all possible trades. To show this we now translate our discussion into ordinal utility and develop an appropriate example.

In the example of Table 11, the six motions now no longer have cardinal utilities associated with them. Instead, reading across each row are the six initial majority (i.e., " $S(x)$ ") and minority (i.e., " $-S(x)$ ") sets to which each member belongs

Table 9. Security Levels when No Trades Occur but Each Member Anticipates External Costs

Members	Outcomes						Σu_i
	$u_i(X)$	$u_i(Y)$	$u_i(W)$	$u_i(Z)$	$u_i(T)$	$u_i(V)$	
1	-2	-2	1	-2	-2	1	-6
2	1	-2	-2	1	-2	-2	-6
3	-2	1	-2	-2	1	-2	-6

Table 10.

The Paradox of Vote Trading as a Three-Person Prisoners' Dilemma			
Member 3		Member 2	
Alternative 1 Not Trade		Alternative 1 Not Trade	Alternative 2 Trade
Member 1	Alternative 1 Not Trade	0, 0, 0	0, 0, 0
	Alternative 2 Trade	0, 0, 0	2, 2, -6
Member 3		Member 2	
Alternative 2 Trade		Alternative 1 Not Trade	Alternative 2 Trade
Member 1	Alternative 1 Not Trade	0, 0, 0	-6, 2, 2
	Alternative 2 Trade	2, -6, 2	-2, -2, -2

Note: In cell (1, 1, 1) the entry is "0, 0, 0" because no one trades. In cells (1, 2, 1), (2, 1, 1), and (1, 1, 2) the entries are also "0, 0, 0" because, if any pair consistently vote sincerely, then all three must do so. In cells (2, 2, 1), (1, 2, 2), and (2, 1, 2) the entries are appropriate combinations of 2 units for the traders and -6 units for the non-trader. In these cases, the -6 units are as calculated in Table 9, while the 2 units result from receiving, first, the payoff to sincere voting (a) when one is not a trader (1+1) and (b) when one's potential trade is with a sincere voter (-2+1); and second, the payoff to sophisticated voting when one's partner is a sophisticated voter (-1+2). In cell (2, 2, 2), the entry (-2, -2, -2) derives from Table 8. This is strictly a Prisoners' Dilemma because, while the outcome (in cell (1, 1, 1)) from the strategy of not trading is preferred by all three players to the outcome (in cell (2, 2, 2)) from the strategy of trading, still the strategy of trading dominates for all three players and the not preferred outcome must inevitably occur among rational players of a non-cooperative game.

when he expresses his true tastes. The sets are arranged from left to right according to the salience (i.e., $s_i(x) = |u_i(P_x) - u_k(P_x)|$) of the motion to the member, with the most salient motion on the left and the least salient motion on the right. For member 1, for example, victory for his position on x is ordinally most valuable, victory on y second most valuable, . . . , and victory on v least valuable. That is, $s_1(x) > s_1(y) > \dots > s_1(v)$. Recalling the second condition of vote trading (statement (4) that "for a trader to trade his salience must be higher on the motion on which his partner switches than it is on the motion on which he switches"), one can easily find trades for each pair of members. Thus member 1 can trade with member 3 on motions t and v . That is, member 1 votes against his interest on his least salient motion, v , and gains thereby from member 3's switch on 1's third most salient motion, t . Similarly, member 3 votes against his interest on his next to least salient motion, t , and gains thereby on his motion of next higher salience, v . These trades are indicated in Table 11 by lines connecting the positions of a member for each trade in which he may be engaged.

After the trades indicated in Table 11 have been made, it can be rewritten as Table 12 in terms of the resultant majorities (i.e., " $T(x)$ ") and minorities (i.e., " $-T(x)$ ") where " $T_d(x)$ " means that the member is on the winning side only because he has voted sophisticatedly and in spite of the fact that he disagrees (" d ") with it.¹³

It is easy to see that this is a paradoxical result. Each member loses a majority position on his two most salient motions, and incidentally obtains a majority position contrary to his true tastes on his least salient motions. For thus losing on his two most and his two least salient motions, he gains

¹³ We assume that the utility of a member for a majority position on a motion he disagrees with, ($T_d(x)$), is the same for him as the utility of a minority position on that same motion, ($-T(x)$), because in both cases his sincere position differs from the prevailing one.

Table 11.

Members	High Salience		Low Salience				Trades	Switches	
	Majority and Minority Positions of Members before Trades		Positions of Members before Trades						
1	$S(x)$	$S(y)$	$-S(t)$	$-S(z)$	$S(w)$	$S(v)$	with 3 with 2	to $T_d(v)$ to $T_d(w)$	—
2	$S(t)$	$S(v)$	$-S(w)$	$-S(y)$	$S(x)$	$S(z)$	with 1 with 3	to $T_d(z)$ to $T_d(x)$ oooo
3	$S(w)$	$S(z)$	$-S(x)$	$-S(v)$	$S(t)$	$S(y)$	with 2 with 1	to $T_d(y)$ to $T_d(t)$	oooo —

Table 12.

Member	High Salience				Low Salience	
	Majority and Minority Positions after Trades					
1	$-T(x)$	$-T(y)$	$T(t)$	$T(z)$	$T_d(w)$	$T_d(v)$
2	$-T(t)$	$-T(v)$	$T(w)$	$T(y)$	$T_d(x)$	$T_d(z)$
3	$-T(w)$	$-T(z)$	$T(x)$	$T(v)$	$T_d(t)$	$T_d(y)$

only on his mediumly salient motions. Thus, clearly, since the degree of utility where he worsens his position is greater than the degree of utility where he better his position, he is in sum hurt by the set of trades.

It might be thought that this result could be avoided by a different set of initial trades. But, referring back to Table 11, it is apparent that such trades are not possible. Member 1, for example, wants to gain on motions t and z by getting someone to switch on these motions. He cannot trade with member 2 on motion t , however, because this would force 2 to switch on his most salient motion in clear violation of statement (4). Therefore, member 1 *must* trade with member 3 on motion t as in Table 11. Similarly member 1 cannot trade with member 3 on motion z because this would force 3 to vote against his true tastes on a more salient motion (z) in order to gain his taste on a less salient one (x or v). Again, therefore, member 1 *must* trade with member 2 on motion z , exactly as in Table 11. By a similar argument, each of the members in this Table is constrained to exactly those trades included in it.

The example in Table 11 shows that the paradox is inherent in the ordinal relationships and is not dependent on particular cardinal utility numbers. It is not necessarily true, however, that the situation depicted in Table 12 is in equilibrium. If one translates the post trading agreements of Table 12 into a new round of trading one gets Table 13, which, if the indicated trades are made, takes the three members exactly where they were in the beginning in Table 11. Thus by voting sophisti-

actedly in the first round they get to a paradox from which they can extricate themselves by voting sincerely in the second round.

Voting that involves first a switch to a position contrary to one's true tastes and then a reverse switch back may seem more devious than sincere. But this is only the beginning. For after a reverse shift, when everybody assumes once again his original sincere positions, there is no reason to believe that pairs of members will not plunge themselves once again into a new round of trades which are individually rational. Indeed, the inexorable logic of individual rationality dictates that if a member is willing to doublecross an old trading partner in order to improve his position through another trade, he is willing to triplecross his new trading partner, etc. The consequence of all members' acting in this self-serving fashion is that trading continues indefinitely. The lack of a stable equilibrium that could break this cycle means that there is no guarantee that even the improved benefits to all, as before the initial or after the subsequent trades in our example, will halt the process. In practice, only when motions are actually voted upon will the process of vote trading be terminated.

Is there any way in which this cyclical paradox can be avoided? One member might refuse to trade; but, if he does so, he exposes himself (as we showed in the previous section) to external costs from the other pair's trade without any compensating gains from his own trade. Hence, as we previously noted, it is a kind of n -person Prisoners' Dilemma in which each member is forced by individual rationality to choose the socially and individually destructive alternative.

Another possible way to avoid the paradox is for a pair to form a coalition agreeing to trade only with each other. Thereby they might obtain the benefits of trade and avoid the external costs of others' trades. This solution was suggested by Dr. Edwin T. Haefle in a critique of the original version of this essay when it was presented at the

Table 13.

Member	High Salience		Low Salience				Trades	Switches	
	Majority and Minority Positions before Round 2 of Trades								
1	$-S(x)$	$-S(y)$	$S(t)$	$S(z)$	$S_d(w)$	$S_d(v)$	with 2 with 3	to $T(v)$ to $T(w)$	— ----
2	$-S(t)$	$-S(v)$	$S(w)$	$S(y)$	$S_d(x)$	$S_d(z)$	with 3 with 1	to $T(z)$ to $T(x)$	oooo —
3	$-S(w)$	$-S(z)$	$S(x)$	$S(v)$	$S_d(t)$	$S_d(y)$	with 1 with 2	to $T(y)$ to $T(t)$	---- oooo

1972 Annual Meeting of the American Political Science Association.¹⁴ Of course, this solution simply denies statement (3), the first condition for vote trading; but it is one way to cut the Gordian knot. It is comparable to cooperative solutions to the Prisoners' Dilemma where, with preplay communication allowed and criminals free to make binding agreements, they agree never to confess and thereby thwart the prosecutor. In the absence of enforceable agreements, however, there may be instabilities in such solutions simply because they are not individually rational. So it is here.

Referring again to Table 11, suppose members 2 and 3 coalesce on motions x and y . Member 1 is excluded, but he may propose that he and member 2 coalesce instead on motions z and w . Once this alternative is proposed, member 2 prefers the coalition with member 1 on z and w to the coalition with member 3 on x and y simply because he (2) gains more from an improvement of his position on his more salient motion, w , than he does from an improvement on his less salient motion, y , and he loses less from voting sophisticatedly on his least salient motion, z , than from so voting on his next-to-least salient motion, x . Thus member 2 prefers coalition (1, 2) to coalition (2, 3) and, of course, member 1—who is in the former but not the latter—also prefers coalition (1, 2) to coalition (2, 3). One can write then

$$(1, 2) D (2, 3)$$

where " D " means that the former coalition dominates the latter in that both members of the former prefer it to the latter.

By a similar argument it can easily be shown that coalition (2, 3) dominates coalition (1, 3). Suppose coalition (1, 3) forms over t and v . Then coalition (2, 3) involving x and y is preferred by member 3 because he (3) gains in coalition (2, 3) on x which is more salient for him than v and loses in coalition (2, 3) on y , which is less salient for him than t . Hence:

$$(2, 3) D (1, 3)$$

Finally, coalition (1, 3) which involves t and v is preferred to coalition (1, 2) which involves z and w , simply because t is of higher salience to member 1 than is z and v is of lower salience to him than is w . Hence:

$$(1, 3) D (1, 2)$$

Putting these statements together we obtain an intransitive result:

$$(1, 2) D (2, 3) D (1, 3) D (1, 2).$$

¹⁴ Edwin T. Haefle, "Paradox Lost" (Washington D.C., mimeographed, 1972).

As is well known, when domination is intransitive the system is unstable. There is always one member left out of the coalition and this member has a strong incentive to break up any existing coalition. Furthermore, he can always do so because it is always possible for him to offer an alternative coalition that dominates an existing one.

This fact suggests that the paradox of vote trading is closely related to the paradox of voting. In Table 14 we have stated the preferences of each member for the possible trades that might be made. Thus for member 1, the highest preference is for the trade on motions t and v with member 3 simply because t is the most salient motion on which 1 can improve his position and v is the least salient motion on which he can vote sophisticatedly. His medium preference is for the trade on motions z and w (with member 2) because z is the next most salient motion on which 1 can improve his position and w is the next-least-salient motion on which he can vote sophisticatedly. His lowest preference is for the trade on motions x

Table 14.

Member	Preference for Trades		
	Highest Preference	Medium Preference	Lowest Preference
1	(t, v)	(w, z)	(x, y)
2	(w, z)	(x, y)	(t, v)
3	(x, y)	(t, v)	(w, z)

and y (between members 2 and 3) on which he is left out. If, now, the members vote on which trades they wish to occur, the outcome will of course be an intransitive social arrangement:

(t, v) is socially preferred to (w, z)

by members 1 and 3,

(w, z) is socially preferred to (x, y)

by members 1 and 2,

and

(x, y) is socially preferred to (t, v)

by members 2 and 3

so that the arrangement is a cycle:

$$(t, v) \rightarrow (w, z) \rightarrow (x, y) \rightarrow (t, v),$$

where the arrow indicates a majority preference.

Thus, no trade is preferred to all other trades, which is equivalent to our earlier demonstration that no coalition can defeat all others. Since there

is no preferred set of trades on which to base a stable coalition, no stable coalition is possible. The paradox of vote trading cannot, therefore, be simply solved by waving it away with a coalition. Rather it is inherent in the nature of the legislative process and, given an appropriate distribution of tastes and external costs, cannot be avoided.

This absence of stability in coalitions means that vote trading cannot assure a dominant collective preference.¹⁵ Just as a cycle among all members (as in Table 13) precludes a dominant collective preference, so the instability of coalitions precludes a dominant collective preference among proper subsets of members. There seems, therefore, to be an inherent disequilibrium in vote trading which is occasioned by the assumption of individual rationality.

The Significance of the Paradox

The popular distrust of logrolling derives, we suspect, from an intuitive, incomplete, but, nonetheless, sure comprehension of this paradox or at least of the external costs on which it is based. To make a judgment on the validity of the popular distrust requires, therefore, that one estimate the likelihood that the paradox arise in real legislatures. If it arises frequently, then surely the popular distrust has a reasonable basis. If it arises only rarely, however, then one probably ought to conclude that logrolling is a socially useful technique to approach Pareto-optimal states of the world. (The positions of members are Pareto-optimal if there are no trades such that the position of at least one member can be improved without detriment to any other members.)

There is no systematic way, so far as we can discover, to investigate real world frequencies of the paradox. One can, however, specify types of circumstances in which it is likely to occur and then estimate the likelihood of these circumstances.

The crucial element of the paradox is external costs, which are of course unique to each trade. It is always the case, however, that more people

gain than lose on each switch (i.e., the members of $-S(x)$ and the pivotal member(s) of $S(x)$ gain, while the non-pivotal member(s) of $S(x)$ lose.) Consequently, in a system of trades—and usually for each participant as well—more instances of gain occur than do instances of loss. But gains and losses are not necessarily equal in size so the paradox occurs when, in a system of trades, members generally lose more when they lose than they gain when they gain. The question then is: Under what real world circumstances might these large losses be expected to occur?

Manifestly, if there is only one trade, the paradox is impossible because the gainers on that trade cannot suffer external costs on another, which does not exist. Consequently, if trades are occasional and isolated and not part of a system of interrelated bargains, losses are probably less than gains for many members of the legislature. This kind of sporadic logrolling is often found in American legislatures, but it is not the kind so earnestly recommended by the several scholars cited in the beginning of this essay. The kind they recommend is, rather, that in which members engage in a constant round of bargaining in order to arrive at optimal outcomes over the whole set of issues in the legislative session. Unfortunately, it is exactly this kind that produces the possibility of the paradox.

If one can separate out his reformist concerns, this is what Schattschneider seems to have perceived about the writing of the Smoot-Hawley Tariff. Each member who joined the tariff combination for a price on some issue (usually a tariff on something manufactured in his district) gained an advantage for himself and his constituents. Such a large number joined, however, that protection was made indiscriminate—nearly everybody got something. Thereby international trade was discouraged and disrupted—to the disadvantage of everybody in the society. To the extent that the Smoot-Hawley tariff deepened and extended the Great Depression, even the gainers probably suffered more than they gained.

One can see the same process at work in, for example, the Rivers and Harbors bills of the twentieth century when they had ceased to have the character of vital internal improvements that they had in the nineteenth. A majority gain from the pork in such barrels, else the bills would not pass. But there are also losses, external costs. Once taxes are paid, the net gains of the gainers are probably pretty small. And if the projects are for the most part economically useless (like locks on a canal only a few pleasure boats use), then opportunity costs probably exceed the gainers' gains. And if the projects are positively harmful (like dikes on a river that would otherwise sup-

¹⁵ For the case of cardinal utility, R. E. Park has shown that there is in general no stable equilibrium if there is a majority that can, through vote trading, improve the payoffs to all its members over the payoffs without vote trading. Furthermore, he has shown that if there is a stable equilibrium with vote trading, it must be exactly the same as the outcome without vote trading. R. E. Park, "The Possibility of a Social Welfare Function: Comment," *American Economic Review*, vol. 57 (December 1967), 1301-04. In "The Possibility of a Social Welfare Function: Reply," *ibid.*, pp. 1311-17, however, James Coleman argues that Park's assumptions are unrealistically restrictive.

port wet lands and a high water table), then their absolute losses almost certainly exceed the gainers' gains.

Still other possible cases come readily to mind: As a long-term example, there is the system of income tax exemptions and deductions, which are so generally distributed they actually provide savings for only an unidentifiable few and which at the same time probably assess very high costs against nearly everybody in the form of distortions of the market for many goods. For another—and even longer term—example, there is the proliferation of army bases throughout the country, each providing a small economic benefit to its neighborhood, but by their inefficiency considerably increasing in sum the military cost for everybody.

As these examples suggest, the bills and circumstances likely to occasion paradoxes are those which bring together an interrelated set of issues, many of which are of interest to only a few legislators. Tax bills, internal improvement bills, redistributions of income, etc. seem especially prone to providing the kind of situation in which the paradox can easily arise. Since these kinds of bills and business occupy a good part of any legislature's time, it must be concluded that the paradox of vote trading is a real fact of political life. One suspects that, because of it, logrolling leads more

often away from than toward Pareto-optimal social allocations.

With a bow in the direction of reformers, both those who recommend and those who execrate logrolling, it might be asked whether or not occurrences of the paradox can be prevented. The answer is, probably not, short of highly unpalatable restrictions. Legislatures do occasionally adopt self-denying ordinances, like the so-called closed rule in the House of Representatives, a rule that prohibits amendments from the floor. While this probably prevents the grosser and more thoughtless types of logrolling, the anticipation of it probably forces the trading back off the floor into committee. Given all the rational pressures for trading, it is not really to be expected that a policy of self-denial will work. Stronger measures, like the system of responsible and disciplined parties, may well make trading impossible in the legislature, but they certainly cannot prevent it in the executive branch or in the party caucus.

It seems, then, that so long as we have the open kind of legislature in which any pair of members may trade, then trading cannot be eradicated. Nevertheless, speaking normatively, the paradoxical consequences are unpalatable and one probably ought to try—by such devices as closed rules and popular condemnation—to discourage the kinds of logrolling that generate paradoxes.

Schema Theory: An Information Processing Model of Perception and Cognition*

ROBERT AXELROD

University of California, Berkeley

I. Introduction

A. The Idea of a Schema

The world is complex, and yet people are able to make some sense out of it. A national or international political arena, for example, is so huge and so complex that to make any sense out of it seems to be a superhuman task. And yet national leaders and even the man in the street do make more or less intelligent interpretations about political events and relationships. How do they do this?

One of the most important tools that people use is a schema. A formal definition will be given later, but informally a schema is a "pre-existing assumption about the way the world is organized."¹ When new information becomes

available, a person tries to fit the new information into the pattern which he has used in the past to interpret information about the same situation. If the new information does not fit very well, something has to give.

Balance is an important example of a commonly used schema, and its use can be illustrated by friendship relationships. A person has a balanced set of beliefs about his acquaintances if he believes that all of his friends like each other, all of his enemies also like each other, and each of his friends dislikes and is disliked by each of his enemies. Thus a balanced set of friendship relationships provides a tidy view of the world in "black and white" terms. It implies that friends of friends are friends, enemies of friends are enemies, and enemies of enemies are friends. More formally, balance can be defined in terms of a set of objects and a set of relationships between them. The whole collection is balanced if the objects can be classified into no more than two non-overlapping sets (e.g., "friends" and "enemies") so that all the relationships which exist between members of the same set are positive (such as "likes") and all the relationships which exist between members of differing sets are negative (such as "dislikes").

Suppose a person interprets the relationships between his acquaintances as fitting a balanced schema. Then if he receives new information about a particular relationship or about several relationships he can try to fit this new information into the old interpretation. If the new information fits exactly into his previous expectations, there is no problem. If it does not fit exactly, he has a variety of tactical choices. He can try to use the same schema as before with the same interpretation of who are his friends and who are his enemies. This will require discounting the new discrepant information. He might also use the same schema of balance, but specify which people are his friends and which are his enemies. Or he may use another schema entirely, and interpret the information as indicating (for example) that there are three different clusters of people (rather than two)

Schlenker of the State University of New York at Albany; Ian Budge, Michael Bloxam, Norman Schofield and Michael Taylor of the University of Essex; Ole Holsti of the University of British Columbia; Ernst Haas and Jeffrey Hart of the University of California at Berkeley; Cedric Smith of the University of London; Zolton Domotor of the University of Pennsylvania; and my research assistants Jacob Bercovitch, Ditsa Kafry, and William Strawn. Parts of this paper have been presented at research seminars at Tel Aviv University, Hebrew University (Jerusalem), Technion (Haifa), the London School of Economics, and the University of Essex. I am grateful to the discussants at all these places. For their generous financial support I wish to thank the Institute of International Studies of the University of California at Berkeley, the Fellowship Program of the Council on Foreign Relations, and the NATO Postdoctoral Fellowship Program of the National Science Foundation. Of course the author is solely responsible for the views presented in this paper.

In reviewing the psychological literature I have relied heavily on Gardner Lindzey and Elliot Aronson, eds., *The Handbook of Social Psychology*, second edition (Reading, Mass.: Addison-Wesley, 1968, 1969), especially the chapters by Berger and Lambert "Stimulus-Response Theory in Contemporary Social Psychology," I, 81-178; Seymour Rosenberg, "Mathematical Models of Social Behavior," I, 179-244; Robert B. Zajonc, "Cognitive Theories in Social Psychology," I, 320-411; Leonard Berkowitz, "Social Motivation," III, 50-135; Henri Tajfel, "Social and Cultural Factors in Perception," III, 315-394; and George A. Miller and David McNeill, "Psycholinguistics," III, 666-794.

¹ Jerome E. Singer, "Consistency as a Stimulus Process Mechanism," in *Theories of Cognitive Consistency: A Sourcebook*, ed. Robert P. Abelson, Elliot Aronson, William McGuire, Theodore Newcomb, Milton Rosen-

berg and Percy Tannenbaum (Chicago: Rand McNally, 1968).

who all like other members of the same cluster and dislike anyone not in their cluster.²

This paper is written with three audiences in mind. For the general political scientist interested in the policy-making process, the paper integrates a variety of psychological research into an organizing framework which can be used as an introduction to a number of relevant subfields of psychology. For the political scientist who is specifically concerned with attitudes and beliefs or the role of perceptual and cognitive processes in politics, the paper is offered in the hope of providing new insights into how people can and should cope with the highly complex environments typical of political arenas. For the experimental and social psychologists whose work is being used, this paper offers an information-processing model of perception and cognition which I call "schema theory." This schema theory has theoretical implications that go beyond the particular findings used. For all readers, the schema theory is meant to raise new questions that can guide further empirical as well as theoretical work. In this way the inaccuracies and overgeneralizations of the current model can be discovered, alternatives proposed, and our knowledge advanced.

At the start it is best to have clearly in mind what the schema theory is about and what it is not about. It is about how a single person observes and makes sense out of a complex environment. Therefore it describes the perceptual and cognitive processes of a single person; it does *not* describe the functioning of a small group, let alone a social movement or a government. Furthermore, it describes how a person processes information and tries to make sense out of it, but it does not describe how he makes policy decisions. This paper is designed to stand alone, but it can also be regarded as part of a larger project which deals with groups as well as individuals and with decision making as well as information processing. The structure of such a larger project is suggested in the author's *Framework for a General Theory of Cognition and Choice*.³ An application of part of that framework to the decision-making pro-

cess in an actual governmental committee is given in the author's "Psycho-algebra: A Mathematical Theory of Cognition and Choice with an Application to the British Eastern Committee in 1918."⁴ The present paper focuses on the information-processing aspects of the overall framework. It employs findings from experimental and social psychology to help formulate a schema theory which provides falsifiable substance to that part of the framework.

The schema theory itself takes the form of a partially specified model of how people process new information. Once the model is presented with the help of a flow-chart, a variety of findings from experimental psychology will be cited to support some of the decisions which went into the construction of this version of the model. Then further empirical findings will be cited to show that some of the predictions which the schema theory makes are valid at least in certain circumstances. The approach used here will then be compared to some other theoretical approaches, and consideration will be given to some of the outstanding research questions raised by the theory. Finally, a few illustrations from international relations and especially foreign policy formation show that this model of how people make sense out of a complex world can be directly relevant to the study of important political processes.

B. The Elements of the Model

The input to the model is a *message*, which contains several types of information. Each message has a known *source*, which may be one's own direct observation or another person. The heart of the message is some *information* about a particular case, such as the state of the friendship relationships between a certain group of individuals. The *type of case* (for example "friendship relationships") is also known. Thus a message in this model might take the form, "Mr. Smith says, 'Joe likes Bill, and Bill likes Sam.'" A full description of this particular case would indicate who likes whom and who dislikes whom among the whole set of relevant people, although the message itself need not contain a complete specification.

A *schema* in this model is defined as a subset of all the possible specifications of cases. A schema can be arbitrarily defined as any subset of the specifications, but typically a schema is defined in terms of the set of all specifications which have certain stipulated properties. For

² For a formal treatment of balance see Frank Harary, Robert Norman and Dorwin Cartwright, *Structural Models* (New York: Wiley, 1965). For a treatment of clusters see James Davis, "Clustering and Structural Balance in Graphs," *Human Relations*, 20 (May, 1967), 181-187; and James A. Riley, "An Application of Graph Theory to Social Psychology," in *The Many Facets of Graph Theory*, Lecture Notes in Mathematics, No. 110 (New York and Berlin: Springer Verlag, 1969).

³ Robert Axelrod, *Framework for a General Theory of Cognition and Choice* (Berkeley: Institute of International Studies, University of California, 1972). Also to appear in *Theories of Collective Behavior*, ed. Julius Margolis and Henry Teune, forthcoming.

⁴ Robert Axelrod, "Psycho-Algebra: A Mathematical Theory of Cognition and Choice with an Application to the British Eastern Committee in 1918," *Papers of the Peace Research Society (International)*, 18 (1972), 113-131.

example, the schema of *balance* is defined as the collection of all specifications which divide objects into two nonoverlapping groups with positive relationships only within groups and negative relationships only between groups. A larger schema would be *symmetry*, in which the only requirement is that whatever A's relationship is to B, B has to have the same relationship to A. Obviously, any complete specification which is balanced is also symmetric, but not vice versa.

A *case* is a specific instance in time. A particular case might represent, for example, the friendship relationships among a given group of people at the present time. An *interpretation* of a case in terms of a schema is a treatment of the case as if it belonged to that schema, perhaps by ignoring the information that might indicate otherwise.

A *complete specification* of a case is the listing of all the details of a case using an interpretation of the case in terms of a given schema. For example, a complete specification of a case of friendship relations using a balanced schema would list all the liking and disliking relationships among the set of people. Notice that if the case were interpreted as fitting a balanced schema, the complete specification could be determined simply by listing to which of the two groups each person belonged.

A specification of a case is never completely certain for a person, so each specification carries a certain degree of confidence; thus a specification of a case represents a belief which is held with more or less confidence by the person.⁵ The *accessibility* of a schema for a particular type of case is the order in which that schema is checked for its fit to the information. A highly accessible schema is checked before a fit with a less accessible schema is attempted. The critical assumption of this model is that the person tries to find a schema which provides a satisfactory fit to the case at hand. How this is done is described in the next section.

C. The Dynamics of the Model

Figure 1 is a flow-chart of the model. The process starts when a message is received about a case (box 1). The first question is then whether there is already an interpretation of this case (box 2).⁶ If there is, then the new in-

formation is checked to see if it fits sufficiently well any of the old specifications based on that interpretation (box 3). If it does fit the old interpretation, there is no problem, and the new information gets interpreted with the help of the old schema (box 11). If the new information does not fit the old interpretation, then blame is affixed by comparing the credibility of the source of the new information with the confidence of the old interpretation (box 4). If the new message is blamed, the credibility of the new source is downgraded for future reference, and the process ends with the old interpretation and specification maintained unchanged (box 5). If the old interpretation is blamed, the source of the old information has its credibility downgraded, and the old interpretation is cancelled (box 6). Whatever can be remembered of the old information is then taken at face value without any schema to interpret it and is combined with the new information in the new case to provide a partial specification of the case at hand (box 8). This combining process (box 8) would also occur if there had been no previous interpretation of the case but there had been some old uninterpreted information on the case (a "Yes" after 7).

From either path (whether from box 6 or 7), the person gets to the step of seeking a schema which will provide a satisfactory fit to the available information at hand (box 9). This step uses a "satisficing subroutine" which will be described separately because it is so important to the model. If the search process fails to find a schema which provides a sufficiently good fit, the source is downgraded (box 10), and the process ends without an interpretation of the case: i.e., the person is baffled.

If the search for a satisfactory schema is successful, this schema is then used to specify further the case at hand (box 11). The specification stage (box 11) is also reached if an interpretation of the case at hand already existed in terms of some schema and if the new information fit the old specification sufficiently well (i.e., "Yes" after box 2 and "Yes" after box 3). The interpretation is made by first modifying the new information if necessary so that it will coincide exactly with the selected schema. For example, if the selected schema is *balance*, then all the inconsistencies (such as "A likes B and C, but B doesn't like C") are resolved to correspond to the schema of *balance*. This gives a modified partial specification of the case. Next this perfectly fitting partial specification is extended with the further use of the selected schema. For example, if the partial specification includes the information that Joe likes Sam, and Sam likes Bill, and the selected

⁵ For simplicity, the present model makes the unrealistic assumption that each of the separate relationships within a specification is believed with the same degree of confidence.

⁶ The present model assumes that new information can be assigned to a case and that each case can be assigned to a known case type. Quite possibly these assignments involve a process similar to the interpretation process described within the model.

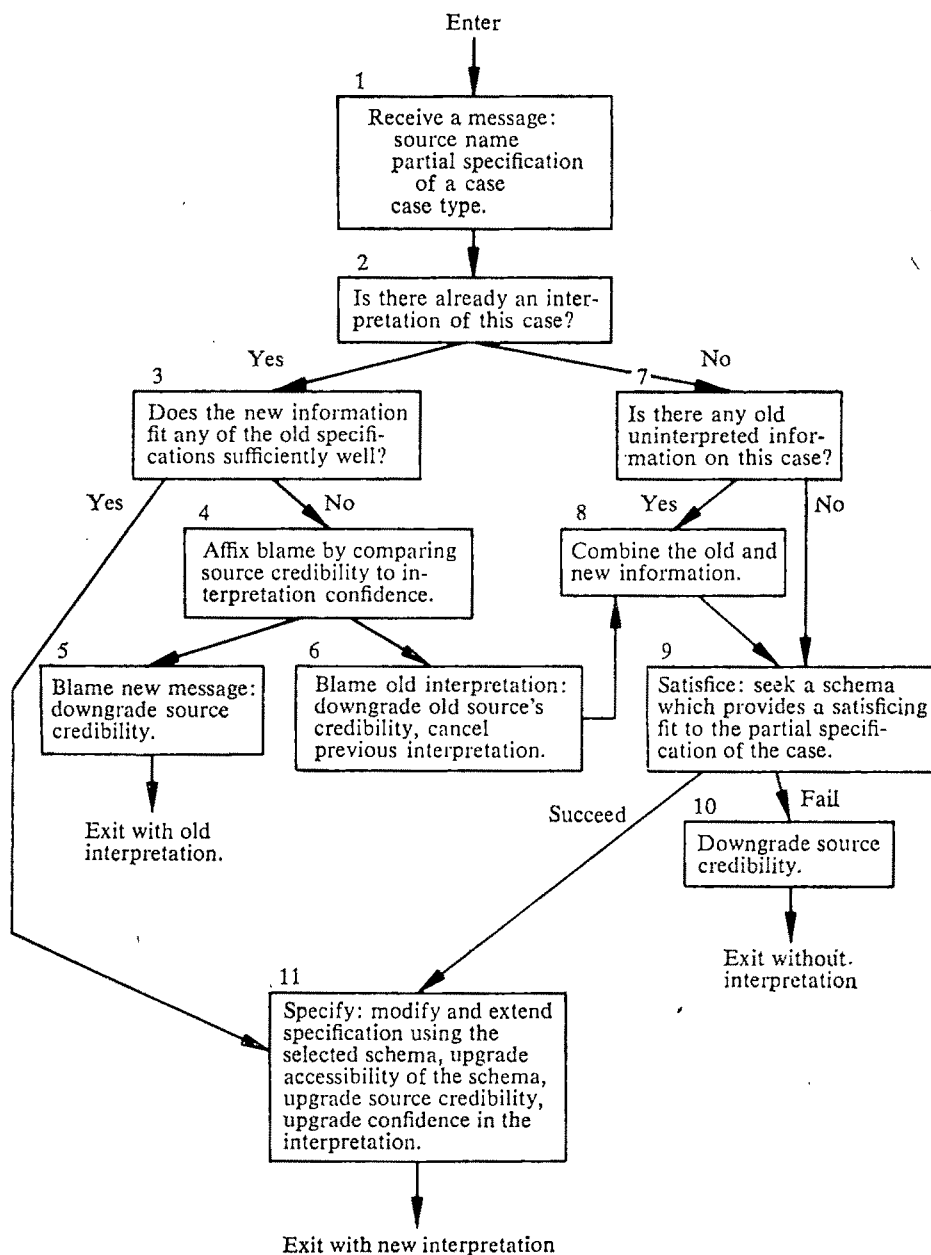

Figure 1. Process Model for Schema Theory.

schema is one of balance, then several inferences can be drawn. One is that Sam likes Joe (since relationships in a balanced schema are symmetric) and another is that Joe likes Bill (since positive relationships in a balanced schema are transitive). These additional inferences allow the person to extend his specification of the current case.

Together with this modification and exten-

sion of the partial specification of the case there are some bookkeeping operations which allow the person to benefit in the future from his experience of finding a satisfactory fit (box 11). He upgrades the accessibility of the selected schema, he upgrades the credibility of the source of the message, and he upgrades the confidence in the current interpretation of the case. If there was already an interpretation of

this case and the new information fits this interpretation, then the confidence in that interpretation will be increased. On the other hand, if there was no previous interpretation of the case, then the certainty of the present interpretation depends directly on the credibility of the source of the current message and the goodness of the fit of the new information to the selected schema. Once the interpretation is made and the bookkeeping is performed, the process ends with the new interpretation and specification as the primary output.

The satisficing subroutine (box 9) is presented in greater detail in Figure 2. This subroutine describes how a person seeks a schema

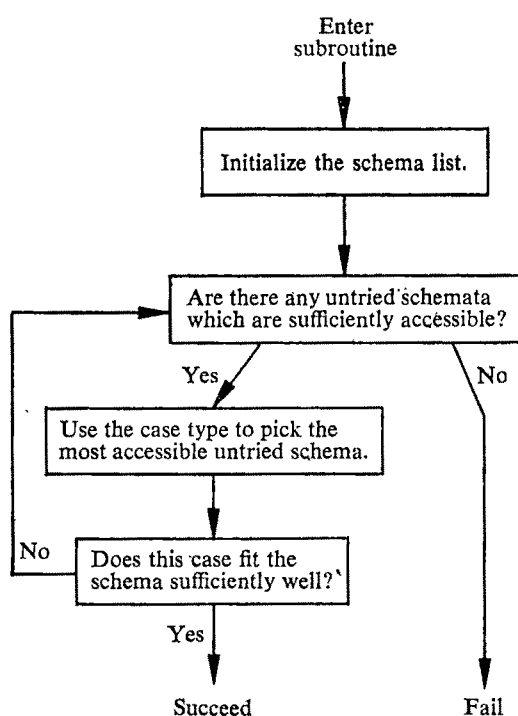

Figure 2. The Satisficing Subroutine.

which will provide a satisfactory fit to the available information on the case at hand. A person does not try out every conceivable schema in an attempt to find the best fit of all. Instead he uses his knowledge of the type of case it is to pick out the most accessible schema for that type of case. Then if the fit with this schema is not sufficiently good, he tries the next most accessible schema, and so on. He continues this process until either he finds a schema which provides a satisfactory fit or he exhausts the schemata which are sufficiently accessible for this type of case. Thus the process of trying to

fit the information about a case to a schema is a process of "satisficing" (to use the apt term of Simon)⁷ rather than maximizing.

This, then, is the model of how a person makes sense out of a complex world. Once he has interpreted a case in terms of a schema he achieves four things:

(1) He modifies some of the information in the light of his old interpretation (if there was one) and the rest of his information. This allows him to change his beliefs about those parts of the information which may have been wrong for one reason or another. Whether these changes are corrections or distortions depends upon the accuracy of the new interpretation and specification.

(2) He usually achieves a more complete specification of the case than he was given by the information in the original message or messages. This allows him to make predictions about previously unobserved aspects of the case. These predictions can be helpful for decision making since the partial specification of the case (even when modified) might not have constituted an adequate guide for behavior. The degree to which the extended specification can serve as a guide for action depends upon whether the selected schema contains parameters that can help a person identify and choose among future courses of action. For example, a balanced interpretation of a set of friendship relationships which includes oneself is a powerful guide to action, since it allows one to orient oneself positively or negatively toward each of the other people without any ambiguity.

(3) He reduces his memory requirements by interpreting the separate bits of information about the current case in terms of the parameters of a schema. For example, it takes n^2 bits of information to remember an arbitrary set of binary friendship relationships between n people, but it takes only $n-1$ bits of information to remember a set of friendship relationships which fits a balanced schema of friends and enemies. The amount of the reduction in the memory requirement depends upon the "size" of the schema, a characteristic which is further explored in VI, A below.

(4) He uses the results of the current case to provide feedback which will affect the processing of information in the future. In particular, he makes adjustments for the future interpretations of this or other cases by updating the accessibility of the schema, the credibility of the source, and the confidence in the specification of the current case. Whether these modifi-

⁷ Herbert Simon, *Models of Man* (New York: Wiley, 1957).

cations will be a help or a hindrance in the future depends upon whether he has drawn the right conclusions from the current message.

Now that the model has been presented, the relevant evidence for this schema theory will be discussed in the next two sections. The first of these sections (Part II) offers the evidence which deals with specific features of the process, as indicated by references to specific boxes in the flow-chart of Figure 1. Part III offers evidence on the overall system performance of the model. These two parts of the paper and the two parts that follow them are written in outline form in order to better display the structure of the presentation.

II. Evidence Relating to Specific Parts of the Model

A. Use of Prior Interpretations (Figure 1, Boxes 2 and 3)

1. *Claim:* A prior interpretation of a case (if one exists) is highly accessible.

Evidence: There is a primacy effect in impression formation, which means that a first impression carries more weight than later impressions.⁸

B. The Blaming Process (Boxes 4, 5, and 6)

1. *Claim:* When new information gives a bad fit to the old interpretation, one possibility is that the old interpretation can be maintained by downgrading the credibility of the source of the new information.⁹

Evidence: Information which is discrepant with previous beliefs tends to be perceived as less informed and less fair.¹⁰

2. *Claim:* The greater the source credibility, the more likely the old interpretation is to be blamed for any discrepancy.

Evidence: When the same message is attributed to sources of differing credibility, differing amounts of attitude change are produced

with the more credible sources producing the greater attitude change.^{11,12}

3. *Claim:* The greater the source credibility, the less likely the source is to be blamed for any discrepancy.

Evidence: A given message is judged more fair and more fully documented when it comes from a high credibility source rather than a low credibility source.¹³

4. *Claim:* Sources whose messages are likely to have been interpreted with an accessible schema tend to have high credibility.

Evidence: Attribution of knowledge, intelligence, education and social status give credibility to an unknown source.¹⁴

But it is not clear whether the old interpretation and the new source can both be blamed at once.¹⁵

5. *Claim:* When an old interpretation is blamed, the schema used in the old interpretation becomes somewhat less accessible for future cases of the same type and perhaps for other types of cases as well.

Evidence: Children can learn with experience to switch the order in which they test hypotheses.¹⁶

But even adults have greater difficulty developing nonlinear hypotheses to explain evidence when linear hypotheses repeatedly fail.¹⁷

C. Combining Information (Boxes 7 and 8)

1. *Claim:* Old and new information about

¹¹ L. R. Anderson, "Discrediting Sources as a Means of Belief Defense of Cultural Truism," *American Psychologist*, 21 (July, 1966), 708.

¹² A more complex model would take account of other source factors as well as credibility. The new information could then be regarded as having a confidence parameter which was determined by factors including the attractiveness and the power of the source as well as the source's credibility. For a review of source factors in attitude change see William J. McGuire, "The Nature of Attitudes and Attitude Change," in *Handbook of Social Psychology*, ed. Lindzey and Aronson, III, 136-314.

Sherif, "Assimilations and Contrast Effects in Communication and Attitude Change," *Journal of Abnormal and Social Psychology*, 55 (September, 1957), 242-252; and Anne S. McKillop, *The Relationship Between the Reader's Attitudes and Some Types of Reading Response* (New York: Columbia University Press, 1952).

the same case are combined using a weighted average.

Evidence: The impression of a sequence of trait adjectives is the weighted average of the impressions of the separate adjectives and of an assumed nonzero initial impression.¹⁸ The existence of the initial impression is supported by the finding that even without specific information, people have non-neutral expectations, e.g., that two people will like rather than dislike each other.¹⁹

D. Selecting a Schema (Boxes 9 and 10)

1. *Claim:* The selection of a schema with which to interpret information about a case is a process of satisficing rather than maximizing the fit.

Evidence:

a. Some pictures are multistable so that the same person can give several different but temporarily stable interpretations of the same ambiguous picture.²⁰

b. The Socratic effect seems to exist in which a person who is asked to state his opinions on related issues changes his opinions to achieve logical consistency.^{21,22}

c. Nonrandom distortions are introduced when a person is asked to reproduce a message.²³ For example, incongruous or unusual details are either forgotten or exaggerated (presumably because either no schema was found to fit them or a relatively inaccessible schema was selected).

Note: There is as yet little evidence to indicate just what type of suboptimal process is used to select a schema from among those which are more or less accessible and which provide a better or worse fit to the initial partial specification of the current case. The use of a satisficing process in a model of schema selec-

tion seems suitable but must be regarded as conjectural. For the use of satisficing processes in the choice of alternative courses of action see Simon,²⁴ March and Simon,²⁵ and Cyert and March.²⁶

2. *Claim:* The accessibility of a schema is independent of the input and output modes.

Evidence: The accessibility of a schema is relatively insensitive to the manner in which the message is presented²⁷ or the manner in which the response is elicited.²⁸

3. *Claim:* The accessibility of a schema depends in part on the case type of the current case.

Evidence: Two identical patterns of relationships are processed differently if different labels are given to them. For example, a pattern of interpersonal relationships which is completely ordered (asymmetric, transitive, and complete) is much easier to learn if the relationships are labeled "influences" rather than "likes."²⁹ See also III, A, 1.

E. Modifying the Initial Partial Specification (Box 11)

1. *Claim:* The initial partial specification is modified in a manner which improves the fit between the partial specification and the selected schema.

Evidence:

a. An assimilation/contrast effect exists in which a subject tends to underestimate the distance between a stimulus and a standard of reference when the distance is small, and overestimate it when the distance is large.³⁰ The effect has been applied to attitude change.³¹

²² This effect was found by William J. McGuire, "Cognitive Consistency and Attitude Change," *Journal of Abnormal and Social Psychology*, 60 (May, 1960), 345-353.

²³ Only weak indications of such an effect were found by R. C. Dillehay, C. A. Insko, and M. B. Smith, "Logical Consistency and Attitude Change," *Journal of Personality and Social Psychology*, 3 (June, 1966), 646-654.

²⁴ Frederic Bartlett, *A Study in Experimental and Social Psychology* (Cambridge: Cambridge University Press, 1969).

personality functioning,³² and social perception.³³

b. A stereotyping effect exists in which a subject underestimates the relevant differences within certain groups and overestimates the differences between contrasting groups. Stereotyping occurs not only in the perception of social groups, but even of abstract stimuli such as lengths of variously classified lines³⁴ and stimuli classified by their positions in an array.³⁵

c. Regularization of speech occurs in which children treat strong verbs as if they were weak verbs (e.g., by saying "comed" instead of "came" for the past tense of "come").³⁶

d. A common error in recalling an experience is to recall the part that fits a schema and forget the part that does not fit.³⁷ In general, material is recalled in a manner which indicates that it has been selected, organized and interpreted.³⁸

e. Stimuli which have separate names can be more accurately remembered than stimuli which do not (e.g., highly codable colors can be accurately selected from a collection of colors). This holds for the same colors between different languages³⁹ and for different colors within one language.⁴⁰ It may be due to covert verbalization.⁴¹

f. The extent to which actual friendship groups fit the schema of balance is overperceived.⁴²

F. Expansion of the Partial Specification (Box 11)

1. *Claim:* The modified partial specification is extended in a manner which does not worsen the fit between the specification and the schema.

Evidence:

a. Guesses based on limited information provide the best possible fits to the appropriate schema (e.g., if "A likes B" then "B likes A" is guessed),⁴³ and in general missing information about friendship patterns is guessed to fit a balanced schema.⁴⁴

b. Guesses in signal detection experiments are consistent with a model of a person as a receiver who is uncertain about the signal rather than as a receiver who has a variable response criterion or who has noise inherent in his sensory system.⁴⁵

c. Errors in long-term recall of liking relationships contained in stories are more likely to be made in recalling imbalanced as balanced patterns than the other way around.⁴⁶

d. The previously noted effect of overperception of balance in actual friendship groups⁴⁷ may be due to the extension of the partial specification beyond the information available.

III. Predictions of System Performance

A. Ease of Learning

1. *Prediction:* Where the initial information provides a good fit to an accessible schema, learning to reproduce the information in a message accurately will be easy.

Evidence:

a. The greater the imbalance in a liking structure, the more errors in learning a semicycle in it.⁴⁸

b. As previously noted, a hypothetical social structure is easiest to learn when it possesses the structural properties expected of it.⁴⁹

c. As previously noted, errors tend to improve the fit between the recalled material and the selected schema (see Evidence for Claim II, E, 1 above).

2. *Prediction:* When an excellent fit is required, the less accessible the appropriate schema is, the more difficult the problem will be to solve.

Evidence:

a. The unfamiliar use of the familiar is a difficult solution to achieve.⁵⁰

b. When a prior success is inapplicable, the problem is difficult to solve.⁵¹

3. *Prediction:* When the initial information provides a good fit to an accessible schema there will be little manifestation of surprise.

Evidence:

a. Messages which provide a good fit to a balanced liking schema are judged to be persuasive, accurate, and pleasant.⁵²

⁵² Milton J. Rosenberg and Robert P. Abelson, "An Analysis of Cognitive Balancing," in *Attitude Organiz-*

b. Messages which are incongruous cause physiological arousal (e.g., as measured by galvanic skin response).⁵³

B. Attitude Change

1. *Prediction:* Old beliefs are changed in accordance with the model, i.e., when information in a new message does not fit the old interpretation, a comparison of the source credibility of the new message with the confidence in the old interpretation can result in blaming the old interpretation.

Evidence:

a. Repeating the same argument is no help in attitude change.⁵⁴

b. Internalization occurs in attitude change, which means that if the source of a persuasive message is forgotten, the changed attitude is still retained. Even if the source is known to switch his position, the attitude change remains.⁵⁵

c. Over a wide range, the larger the advocated change, the greater the change in attitude, provided the source is regarded as credible.⁵⁶

C. Effect of Experience

1. *Prediction:* A highly accessible schema will only be downgraded if reliable information is acquired which does not fit the schema (since no other schema will get priority in the search process).

Evidence: A dog taught to jump at regular intervals to avoid a shock continues to jump long after the shock mechanism is turned off. In order to unlearn the lesson, he has to be physically prevented from jumping.⁵⁷

2. *Prediction:* When the interpretation of a sequence of cases repeatedly uses the same schema, the schema becomes more accessible.

tion and Change, Milton J. Rosenberg, Carl I. Hovland, William J. McGuire, Robert P. Abelson and Jack W. Brehm (New Haven: Yale University Press, 1960), pp. 112-163.

Therefore, it will eventually be selected even when other less accessible schemata might provide better fits.

Evidence: As previously noted, children can learn to switch the order in which they test hypotheses.⁵⁸

D. Resolution of Cognitive Inconsistencies

1. *Prediction:* When some information (whether old or new) fits none of the sufficiently accessible schemata precisely, employable tactics include the following: blame the source, use the other old and new information about the case to select a schema which gives a sufficiently good fit to all the available information, or exit without an interpretation.

Evidence: These modes are among the many which have been suggested (with varying degrees of empirical support) as ways of resolving cognitive inconsistencies.⁵⁹

E. Measuring Accessibility of a Schema

The accessibility of a schema for a particular type of case is not directly observable. It can be measured indirectly using any one of the four methods described above: ease of learning, attitude change, effects of experience, and resolution of cognitive inconsistencies. When studying a new person or a new type of case, one method can be used to validate another method's results.

IV. Comparison with Other Theoretical Approaches

A. Computer Simulations

To my knowledge, no computer simulation of human perception or cognition treats the differential accessibility of alternative schemata, which is the heart of the present model.⁶⁰

Schneider, "Computer Simulation of a Model of Neurotic Defence Processes," *Behavioral Science*, 15

B. Gestalt School of Psychology

The Gestalt School⁶¹ provides some of the fundamental ideas which the present information processing model tries to develop. The common criticism that the Gestalt approach has lacked precision is well founded.

C. Information Theory

Information theory⁶² provides some useful mathematical tools, including a way to measure the size of a schema (for a few details see Part VI, A). The application of information theory to formal problems in statistical inference is by now quite well developed.⁶³

D. Balance Theory

The predictions of balance theory⁶⁴ are consistent with the schema theory for those and only those situations in which the balanced schema is the one selected (see VI, B).⁶⁵

1. *Claim:* Balance is a highly accessible schema in certain contexts, such as friendship relationships.⁶⁶

Evidence (all previously cited):

- a. Balanced messages are more acceptable than unbalanced messages.⁶⁷
- b. Incomplete specifications are extended with the use of a balanced schema.⁶⁸
- c. Balance is overestimated.⁶⁹
- d. A balanced message is easier to learn and to retain over time.⁷⁰

e. Balanced messages are viewed as less likely to change than unbalanced messages.⁷¹

f. Balance is an accessible schema in perceived friendship relationships among a set of countries.⁷²

g. Balanced situations are imagined more vividly, rapidly and elicit higher affective ratings than unbalanced situations.⁷³

2. *Claim:* The limitations of balance theory can be understood in terms of the availability of schemata more accessible than the balance schema which can provide adequate fits to the information on a given case.

Evidence:

a. The schema of positivity (consisting of nothing but positive relationships) can explain some of balance theory's failures, such as

(1) positive links are easier to learn than negative links,⁷⁴

(2) positive semicycles are easier to learn than negative semicycles,⁷⁵ and

(3) there is not a large negative correlation between the first two links of a triad when the third is negative.⁷⁶

(4) subjects' willingness to change the relationships between themselves and a fictitious person is determined by positivity forces.⁷⁷

b. If a subject likes chicken, and chickens like chicken feed, the subject is not expected to like chicken feed.⁷⁸

c. If subjects are told that two boys like a girl, the subjects do not expect them to like each other as much as if they both like a third boy.⁷⁹

d. If told that two people like *Newsweek* magazine, subjects do not mistakenly learn that they like each other, but this mistake is made when two people are said to like racial integration.⁸⁰

3. *Claim:* A balanced schema is selected when appropriate, even outside of the context suggested by balance theory.

Evidence: The concepts used by decision makers in describing their images of external reality are balanced.⁸¹ A balanced schema is applied in tasks of recall and attribution of responsibility.⁸²

4. The schema theory is consistent with all of the following explanations for the tendency toward cognitive consistency: a motivational drive toward consistency, limited cognitive capacity resulting in the need for simplification of incoming information, and inadequacies in the incoming information which must therefore be processed in a manner that allows predictions to be made and later tested.

V. Development of Schema Theory

A. General Principles of Schema Accessibility

1. *Claim:* People seek logical consistency.

Evidence:

a. Arguments against the premise of a syllogism will affect the belief in the conclusion a week later.⁸³

b. Attitude change by posthypnotic sug-

Smith, "Logical Consistency and Attitude Change," *Journal of Personality and Social Psychology*, 3 (June, 1966), 646-654.

gestion causes cognitive reorganization for the maintenance of consistency.⁸⁴

c. People with inconsistent associative structures are easier to change by reinforcement.⁸⁵

d. Logical "mistakes" are often due to the use of different premises from the ones intended.⁸⁶

e. As previously mentioned (II, D, 1, b), there may be a Socratic effect in which a person who is asked to state his opinions on related issues changes his opinions to achieve logical consistency.

2. *Claim:* There is a great deal of culturally stored information and knowledge (especially in the language of a society as Whorf emphasizes).⁸⁷ Even beyond this culturally stored information, the accessibilities of schemata are determined in part by factors other than direct observation or interpersonally transmitted experience.

Evidence:

a. Linguistic and other types of cognitive development proceed in relatively fixed stages, which suggests that some types of general rules are easier to learn than others.⁸⁸

b. There seem to be some linguistic universals which are nonfunctional principles of grammar common to all languages. For example, grammatical operations apply in a cyclic fashion, first to the most deeply embedded structures, then to the structures that contain them, and so on.⁸⁹

c. There seems to be a working model of three-dimensional space within the human nervous system which provides the capacity to interpret visual images.⁹⁰

⁹⁰ Attneave, "Multistability in Perception."

3. *Claim:* Schemata which are readily accessible for the interpretation of sets of relationships tend to have simple mathematical properties.

Evidence: There is empirical evidence for the accessibility of schemata with the following mathematical properties:

a. positive (see IV, D, 2, a above).⁹¹

b. symmetric.⁹²

c. transitive.⁹³

d. balanced (see IV, D, 1 and 3 above).

e. acyclic (no cycles, i.e., no set of relationships such that aRb , bRc , cRd , . . . , xRy , yRz , and zRa).⁹⁴

f. linearly ordered (irreflexive, asymmetric, transitive, and complete).⁹⁵

g. singly ordered (several dimensions collapsed into one linear order).⁹⁶

4. *Claim:* A general feature of schemata is that a new case can be extended by using the parametric values of the specification of old relevant cases (which is a kind of generalization process).

Evidence:

a. Subjects systematically go beyond assuming attitudes which are sufficient to explain specific actions they observe, imputing to the actor attributes of trans-specific generality.⁹⁷

⁹¹ Concept formation experiments provide further indirect evidence. See, for example, Jerome S. Bruner, Jacqueline J. Goodnow and George A. Austin, *A Study of Thinking* (New York: Wiley, 1956).

⁹⁷ C. Norman Alexander, Jr., and Joyce Epstein,

b. Subjects accept verbal generalizations even when they know of exceptions to them.⁹⁵

B. Unanswered Questions

Among the questions which need to be answered in order to construct a more precise theory of schemata are the following:

1. How does one set the threshold for the level of goodness of fit which is regarded as providing a satisfactory interpretation of a case by a given schema? (See V, C, 1 below on the role of personality and VI, B below on the role of the reliability of the initial information.)

2. If an old interpretation of a case is canceled, is the old schema made less accessible?

3. When an old interpretation does not fit new information, is the blame ever divided between the two (see II, B, 4 above)?

4. Can goodness of fit be treated as a metric (distance function) on the abstract space of specifications of cases (see VI, B below), and if so what are the characteristics of this metric?

5. When and how does a person invent an entirely new schema?

C. Psychological Implications

Some psychological results which might be dealt with by an expanded version of the present model are the following:

1. Personality variables. Individual differences in cognitive complexity,⁹⁹ authoritarianism,¹⁰⁰ intolerance for ambiguity¹⁰¹ and autism/realism¹⁰² might be due to different thresholds of minimum goodness of fit. For example, authoritarians are likely to resist mildly derogatory information about a respected partner,¹⁰³ thereby maintaining an accessible interpretation at the cost of a good fit.

2. Cognitive dissonance. Dissonance effects

include the result that when a boring task is voluntarily chosen by a subject, the less the reward, the *more* the task is valued. This type of result might be attributable to the accessibility of a schema incorporating the consistency of self-behavior.¹⁰⁴

3. Wishful thinking. The correlation of one's expectations with one's desires¹⁰⁵ might reflect an accurate generalization of past experience even when it seems inappropriate in an artificial setting.

VI. Applications in Normative Analysis

An information-processing model can be very helpful for suggesting new questions for further research as well as for integrating a variety of findings from experimental and social psychology. But from the viewpoint of political science, perhaps the greatest benefit from this type of model will come from its ability to provide a framework for the analysis of actual behavior in important arenas of human action. If we are able to identify the characteristics of optimal performance and if we are able to compare actual performance to optimal performance, then we can both improve our understanding of people's actual performance and perhaps offer some helpful advice to those who wish to improve their own performance.

The process of selecting a schema with which to interpret a case offers two opportunities for this type of analysis. The selection process within the model is a satisficing procedure which does not necessarily yield the best possible fit between the selected schema and the information available about the current case—nor should it necessarily, as will be shown. In addition to the information about the current case, the best use of the satisficing procedure requires at least two types of parameters. These are (1) the relative accessibilities of alternative schemata and (2) the magnitude of what constitutes a satisfactory fit. Analyzing how these two parameters should be set will help to identify the characteristics of optimal performance.

A. Optimal Accessibilities of Schemata

A particularly illuminating question for normative analysis using schema theory is how to

¹⁰⁴ Leon Festinger, *A Theory of Cognitive Dissonance* (Stanford: Stanford University Press, 1957); Jack W. Brehm and A. R. Cohen, *Explorations in Cognitive Dissonance* (New York: Wiley, 1962); and Zajonc, "Cognitive Theories in Social Psychology."

¹⁰⁵ Hadley Cantril, "The Prediction of Social Events," *Journal of Abnormal and Social Psychology*, 33 (1938), 364-389; D. McGreor, "The Major Determinants of the Prediction of Social Events," *Journal of Abnormal and Social Psychology*, 33 (1938), 179-204; and McGuire, "Cognitive Consistency and Attitude Change."

assign relative accessibilities to a given set of schemata. In other words, given a set of schemata, which one should be tested first against new information of a specific type of case, which second, and so on. The answer involves the tradeoff between two competing values which are both desirable in an accessible schema. These two valued characteristics of a schema are veridicality and smallness of size.¹⁰⁶

The *veridicality* of a schema is the subjective probability that a case of a specific type is in fact an instance of that schema. Obviously, the person wants to interpret new information as fitting a highly veridical schema since such an interpretation would make it likely (at least in the sense of subjective probability) that his modification and extension of the initial partial specification of the case would be accurate rather than erroneous.

The second value desired in an accessible schema is smallness of size. The *size* of a schema is the number of different complete specifications which are instances of the schema. For example, the size of the balance schema is given by the number of different ways of dividing a group of people into two groups (such as friends and enemies). The smaller the size of a schema, the more can be deduced about a case which is interpreted in terms of that schema.

The veridicality of a schema depends on the type of case (see II, D, 3), but the size of the schema is solely a function of the nature of the schema itself. A useful measure of the smallness of a schema is given by the information theory concept of redundancy.¹⁰⁷ For present

¹⁰⁶ For a formal model with a similar tradeoff, see Shun-ichi Amari, "Theory of Learning Decision Systems," in *Unifying Study of Basic Problems in Engineering and Physical Sciences by Means of Geometry*, ed. Kazuo Kondo (Division 1), (Tokyo: Gakujutsu Bunkai Fukyu-kai, 1969), pp. 33-42 (which is RAAG Memoirs, 4, [1969], 567-576).

¹⁰⁷ With the assumption that each instance of a schema has equal subjective probability, size determines redundancy. The assumption is based on the principle that if some instances have a higher subjective probability than others, they should be treated by the model as belonging to different schemata. For applications of redundancy to psychology see Garner, *Uncertainty and Struc-*

purposes it is sufficient to note that interpreting a case in terms of a small schema has the advantage of allowing a greater amount of modification and extension of the original partial specification of the case.

A numerical illustration will help make these ideas clear. Consider a set of binary relationships between five objects (such as friendship relationships between five people). Any complete specification of such a case can be represented as a 5 by 5 matrix with 1 and -1 entries (although for convenience a -1 will be shown as a blank in Figure 3 below). For example, the entry in the second row and fourth column could represent whether or not the second person likes the fourth person.

Using this representation, a schema can be defined as the set of all matrices which satisfy certain specified properties. The number of different complete specifications for a schema can then be counted to give the exact size of that schema. Examples of specifications which fit different schemata are shown in Figure 3. The order of the rows and columns has been chosen to best display the defining characteristics of the different schemata.

The null schema is the one which includes all possibilities. There are 5^2 or 25 entries in the matrix, so there are a total of 2^{25} or about one hundred million possible specifications of the null schema. One of these is shown in Figure 3a.

The balance (or 2-cluster) schema has a size of 16, since there are $2^5/2$ ways of putting 5 people into one of no more than two groups, when the order of the groups does not matter. An example is shown in Figure 3b.

Figure 3c displays one of the specifications of the 3-cluster schema. There are 41 ways of putting 5 people into one of no more than three groups ($41 = (3^5 - 3)/3! + 1$).

The positive schema has only one specifica-

ture; and Wendell R. Garner and David E. Clement, "Goodness of Pattern and Pattern Uncertainty," *Journal of Verbal Learning and Verbal Behavior*, 2 (December, 1963), 446-452. For a recent critical review see D. W. J. Corcoran, *Pattern Recognition* (Harmondsworth, England: Penguin Books, 1971).

Figure 3. Sample Specifications of Schemata of Relationships Between Five People.

tion (shown in Figure 3d), since there is only one way that everyone can like each other.

The schema of linear order has 5! or 120 specifications since there are that many ways of arranging 5 people in order without ties. Such a schema would be appropriate if the case were about relationships of height rather than friendship. Figure 3e illustrates this schema with the order of the rows and columns chosen to display best the pattern.¹⁰⁸

The tradeoff between veridicality and smallness among schemata is illustrated in Figure 4 for a given type of case, namely friendship relationships. A highly accessible schema should be both veridical and small. The balance (or 2-cluster) schema is moderately small and has fairly good veridicality, since the person presumably knows that friendship groups do tend to be balanced.¹⁰⁹ The positive schema is very small indeed, but is not very veridical. The 3-cluster schema is assumed in this example to be more veridical than the positive schema and is certainly more veridical than the balance schema, but it is larger than either of them. The null schema is certain to be totally veridical, but it is no help in the modification and extension of a partial specification of a case, since it is so large as to include every possibility. The schema of linear order is of large size and is assumed to have low veridicality in this example since a linear order is asymmetric (if one individual has the relationship to a second, then the second can not have that relationship to the first), whereas actual liking relationships tend to be symmetric.

The dotted line of Figure 4 represents the frontier of knowledge about this type of case using these schemata. The growth of knowledge about a type of case could be reflected in the discovery of a schema which was above and to the right of this line and which thereby pushed out the frontier of knowledge.

Pushing out the frontier of knowledge may be one of the tasks of the social scientist, but the person who is actually trying to make sense out of a complex world is often more interested in just what he should do *today* when the frontier of knowledge is at a given place. The answer in terms of Figure 4 is that he should assign high accessibilities to schemata which are high and to the right in Figure 4, medium ac-

Figure 4. Illustration of the Tradeoff Between Smallness and Veridicality of Different Schemata for Cases of Friendship Relationships.

cessibilities to schemata which are in the upper left or lower right, and low accessibilities to schemata in the lower left.¹¹⁰

B. Optimal Threshold of an Acceptable Fit

Setting the relative accessibilities of schemata determines the order in which they will be checked for their fit to the current case. Given this order of checking, one may ask what should constitute a satisfactory fit to bring a successful end to the satisficing checking process? In other words, what should be the threshold of how bad a schema's fit can be and still be acceptable as the interpretation of the present case?

To deal with this question a geometric analysis is helpful. To start with, a complete specification of a case can be represented as a single point in an abstract space, to be called a Q -space. In this space there is a distance function (or metric) which measures how similar two complete specifications are to each other. Thus if x and y are two points in the Q -space, then $d(x,y)$ is a real number indicating the degree to which these two complete specifications are similar or dissimilar to each other.¹¹¹

¹⁰⁸ For schemata of infinite size (e.g., with continuous rather than discrete parameters), the appropriate measure of size uses degrees of freedom. For example, a linear equation has two degrees of freedom (namely a and b in $y = ax + b$), and a quadratic equation has three degrees of freedom (namely a , b and c in $y = ax^2 + bx + c$).

¹⁰⁹ Kogan and Tagiuri, "Interpersonal Preference and Cognitive Organization."

¹¹⁰ To carry the analysis further one could do the type of indifference curve analysis used in microeconomics. Negatively sloped indifference curves could be drawn in Figure 4 to represent the tradeoffs between smallness and veridicality. Then the schemata should be given accessibility in order of their intersection with the ordered set of indifference curves. If there are enough alternative schemata to allow for a continuous approximation of the frontier of knowledge, then the schema which should be given the highest accessibility is represented by the point at which one of the indifference curves is tangent to the frontier of knowledge.

¹¹¹ A metric function has the following properties:

The distance function can be applied to pairs of sets in Q by taking the minimum distance between members of the two sets. For example, let X be a partial specification of a case (i.e., a subset of Q consisting of all complete specifications which are consistent with the information in the partial specification), and let S be a schema (so that S is also a subset of Q by definition). Then define $d(X, S) = \min d(x, y)$ for x in X and y in S . Less formally, the distance between a partial specification and a schema is how close they come together.¹¹²

There are four immediate uses to which the distance function can be put. First, goodness of fit can be defined as the distance between an initial partial specification and a schema, namely $d(X, S)$. Second, a satisfactory fit can be defined by the condition that this distance is less than or equal to k for some fixed k . Third, the selected schema is the first schema such that $d(X, S_i)$ is less than or equal to k , where S_1 is the most accessible schema, S_2 is the second most accessible schema and so on. Fourth, the modification and extension of a partial specification is a set of points, X' , defined in the following manner. X' is the set of all x' in the selected schema, S' , such that $d(X, \{x'\}) = d(X, S')$. In other words, the modified and extended specification of a case is the set of all points in the selected schema which are at minimal distance from the initial partial specification. The idea is that the initial specification is altered as little as possible in order to make it fit the selected schema.

An abstract illustration of these ideas is provided by Figure 5. In this figure there are three schemata labeled in order of their accessibility, S_1 , S_2 and S_3 . There is also a partial specification of a case, X . Shown near the bottom is a scale of the distance, k , which is the maximum allowable for a satisfactory fit. (For convenience here, the metric in Figure 5 can be thought of as a normal Euclidean distance, but other metrics are certainly possible.)

Some of the key operations of the information-processing model can be illustrated with the help of this geometric example. The satisficing routine proceeds as follows. S_1 is not selected because all of its points are too far from any of the points in X . S_2 is selected as the interpretation of the case because some of the points in X are within a distance of k from some of the points in S_2 . S_3 is never even checked by the satisficing subroutine and there-

$d(x, y) = d(y, x)$; $d(x, y) \geq 0$; $d(x, y) = 0$ if and only if $x = y$, and $d(x, y) + d(y, z) \geq d(x, z)$.

¹¹² Although the distance between points is a metric function as defined in the previous footnote, the distance between sets is not.

Figure 5. Illustration of the Q Space.

X is the initial partial specification of the case

S_1 , S_2 and S_3 are schemata

k is the maximum distance of a satisfactory fit

x' is the final specification of the case using the selected schema, S_2

fore cannot be selected even though S_3 provides the best fit in this example. The specification routine proceeds by picking the points in the selected schema, S_2 , which are closest to X . In this example, there is a unique such point, x' , and thus the specification process results in a complete specification of the case as well as an interpretation of the case as belonging to the S_2 schema.

The familiar case type of friendship relationships helps demonstrate some of the properties a Q -space can have. For simplicity consider a set of friendship relationships among three people which take on one of only two values (i.e., like and dislike). Assume for a moment that the relationships are reflexive (everyone likes himself) and symmetric (everyone's feelings are reciprocated). Then the Q -space is three-dimensional, with the dimensions representing the three relationships between A and B , B and C , and A and C . This space has exactly 2^3 or 8 points. The schema of balance is a set of exactly four points in this space, namely $(1, 1, 1)$, $(1, -1, -1)$, $(-1, -1, 1)$ and $(-1, 1, -1)$.

This particular type of Q -space can be applied to the line hypothesis of Abelson and Rosenberg, which forms the basis of what is known as the theory of cognitive balance.¹¹³ Their line hypothesis can be regarded as simply a special case of the specification routine of the present model for the situation in which the selected schema is balance and the distance func-

¹¹³ Abelson and Rosenberg, "Symbolic Psycho-logic."

tion is the so-called city block metric (in which the distance between two points is the arithmetic sum of the separate distances separating them on each dimension of the Q -space).

As another example, suppose that the relationships are still reflexive and symmetric but are now continuous (to allow degrees of liking and disliking). The Q -space is still three-dimensional, but now has an infinite number of points. The schema of balance is now the set of points of the pyramid that has for its four corners the four balanced points listed above.¹¹⁴

With this geometric background, it is easy to see the implication of changing the size of the maximum distance of a satisfactory fit, k . The smaller the maximum distance for a satisfactory fit, the greater the chance that the more accessible schemata will be rejected and a less accessible (or no) schema will be selected.

In a domain which has precise measurement (such as one of the natural sciences), it is best to set k relatively low. The reason is that if a highly accessible schema gives a mediocre fit in such a situation, it is best to keep searching for a better fit since it is unlikely that random error alone would be responsible for the discrepancy.¹¹⁵

Conversely, in a domain which has imprecise information (such as is common in politics) it is best to set k relatively high so that an accessible schema is not rejected when the observed discrepancy could easily have been due to random error.¹¹⁶

¹¹⁴ Wiest, "A Quantitative Extension."

¹¹⁵ Signal detectability theory treats the situation in which there is only one accessible schema. See Coombs, Dawes, and Tversky, *Mathematical Psychology*.

¹¹⁶ Geometric analysis of this section can be extended to yield a number of suggestive theorems about some of the more subtle consequences of the present information processing model. Here are four such results.

(1) *Potential Completeness*. If Q is a continuous space, then under a weak set of assumptions the modified and extended specification of a case will be a complete specification of the case. This corresponds to the situation in which the person can make an estimate about every feature of the case (e.g., every friendship relationship). For example, in Figure 5 the set of points in S_2 which are minimally distant from X is a single point, x' , and is therefore a complete specification.

(2) *Potential Enlargement*. Under certain circumstances the modified and extended specification can actually be larger than the initial partial specification. This occurs when there are few points in the partial specification, but more points in the selected schema which are at the minimum distance from the initial partial specification than there were in the initial partial specification itself. In such a situation the person has a schema which he can use to interpret the case, but he does not end up with a single unique specification of the case (even if he started with one). He believes something is wrong with the initial information, but he can not pin down what it is, even though he has selected a schema with which to interpret the case.

VII. Illustrative Applications to Politics

Now for a few illustrations to show that the model of how people make sense out of their complex worlds can be directly relevant to political phenomena. These examples are illustrative only, since the range of the potential political applications seems almost to coincide with the range of political science. Because my own interests are primarily in international relations and foreign policy formation, most of the examples are taken from that domain. The reader is invited to see if his favorite political actors try to make sense out of their own complex worlds, and if so whether it makes any difference how they try to do it, and how they might do it better.

Before turning to the illustrations, several points should be made about the operationalization of the schema theory. As a model of what happens in a controlled setting, the schema theory has already been operationalized by the same operations which have been used in the various experiments upon which the theory is based. For example, all of the standard ways of eliciting a subject's beliefs can be used to measure the details of the person's modified and extended specification of a case. As a model of what happens in a political arena, somewhat different measurement techniques are needed. For example, the problems of measuring the beliefs of a political actor are certainly difficult, but hardly unique to this model. Once again, there are a set of standard techniques which can be used to measure beliefs, this time involving the analysis of interviews, questionnaires, documents produced by the actor, and the actor's actual decisions. For the parameters of the model which are not "directly observable," the system level characteristics of the model itself provide alternative indicators that can be used as cross-validating measurement

(3) *Cancellation Effect*. Under a wide range of conditions, an initial partial specification with continuous parameters will be modified to achieve a fit to the selected schema by leaving most of the parameters unchanged and by giving the rest neutral values. This can be called the cancellation effect since the only changes in the modification are neutralizations. The cancellation effect is a consequence of the principle that the modification is made in such a way as to move the least distance to the selected schema.

(4) *Seriatim Effect*. Under a wide range of circumstances, the sequential presentation of the same information can reduce the amount of attitude change compared to a simultaneous presentation. The seriatim effect is due to the principle that a message is first evaluated for how well it fits into a previous interpretation of the case. Presenting discrepant information a little at a time can result in each message being blamed as it is received, whereas if the discrepant information were presented all at once, the blame might be affixed to the old interpretation.

techniques. A good example of the potential for cross-validation is schema accessibility which can be indirectly measured with any of four methods (see III, E).

While waiting for independent evaluations of the model in different political arenas, one can hopefully expect that the literature on perception (and perhaps cognition) will generalize quite well to field studies. People may bargain and exercise power differently in a laboratory than they do in a "real life" situation, but they probably use the same thought processes no matter where they are. This is another way of saying that perception and cognition may be more fundamental psychological processes than bargaining and the exercise of power. Because they may be more fundamental, they probably generalize better from one context to another. But even before the schema theory is empirically evaluated in political contexts, it can serve well heuristically by suggesting new ways of looking at some old political problems. In this spirit the illustrative examples are offered.

A. Conceptual "Models" of One's Adversaries

The first example is a direct application of the normative analysis of schema accessibilities (VI, A). As Allison points out, most foreign policy analysts explain and predict the behavior of national governments in terms of a rational policy "model."¹¹⁷ He also points out that more sophisticated "models," such as an organizational process "model" and a bureaucratic bargaining "model," can be formulated.

If these alternative "models" are treated as schemata which include some possibilities and exclude others, then the present information-processing model can be applied. In particular, the question of which schema should be given highest accessibility can be analyzed. As has been discussed in Part VI, A, there is a tradeoff between improved veridicality of a schema and smallness of size. The improvement of the conditions of the tradeoff comes from improved knowledge of the environment (e.g., by discovering a schema which is both small and veridical, a process that is similar to discovering a theory which is both parsimonious and accurate).

In the meantime (at any given level of knowledge about the environment) the conditions of the tradeoff have this implication: it may be better for the analyst to give higher accessibility to a small but "simple minded" schema (such as one based on the rational pol-

icy "model") rather than to a more sophisticated but larger schema.

B. Individual Belief Systems
